If our sun were removed to the Pleiades it would hardly be visible in an opera glass with which nearly 100 stars can be seen in the cluster. Sixty or seventy Pleiades surpass our sun in brilliancy; Alcyone being 1000 times more brilliant, Electra nearly 500 times and Maia nearly 400. Sirius itself takes subordinate rank when compared with the five most brilliant members of a group the real magnificence of which we can thus in some degree apprehend. To know the dimensions, not of the individual stars, but of the cluster itself, occasions difficulties; but on the assumption that it is approximately spherical in shape, its dimensions can be calculated at 40,000,000,000 miles. Taking the dimensions of our solar system by themselves, or in relation to terrestrial matters, they appear stupendously enormous. Neptune, the most distant known member, has an orbit over 5,000,000,000 miles across, but the solar system is to the Pleiades but as a Lilliputian to a Brobdignagian—is but a microbe to a mountain—for a sphere the size of the solar system would, if spherical and its diameter that of the orbit of Neptune, be relatively so minute that it could be contained more than 400,000,000,000 times in a sphere the size of the Pleiades; in other words, the limits of the Pleiades could contain 150 solar systems as many times over as there are miles between Neptune and the sun.

It must not be forgotten that though there are 2500 stars in the cluster, yet with such dimensions for the entire group, vast distances must separate the stars from one another. In fact, 2300 spheres, each with a diameter of 5,000,000,000 miles, could be contained in the limits assigned.

A Nuvel Bridge Test.

A novel bridge test to destruction is reported by the German papers as occurring at Wohlhusen, on the Jura-Simplon railway of Switzerland. The structure was built over the Emme river in 1874, and greatly resembled the bridge belonging to the same company at Moenschenstein, which failed in June, 1891. The Wohlhusen bridge has proved too light for the trains coming upon it of late, so the railway company decided to replace it by a heavier structure. Owing to the similarity between it and the Moenchenstein bridge, it was decided to test it to destruction The trusses are stated to have been 157 feet long and 19 feet high, while those of the Moenchenstein bridge were 138 feet long and 20 feet high. The tests were made by uniformly loading half the bridge with rails and gravel. The loading was begun April 9th and continued daily until April 24th, when slight changes of form began to occur under a load of 7800 pounds per linear foot. By 9 A. M., April 25th, the load had been raised to nearly 9400 pounds per linear foot of half the bridge, and there were numerous small cracks, although no indications of the particular point at which failure might occur. Forty minutes later, however, there was a sudden crash, said to resemble a peal of thunder, and the bridge collapsed so suddenly that the manner of its fall could not be observed.

Photographic Plates that Won't Frill.

One of the most vexatious experiences of the amateur photographer is to discover after properly guarding his plates from light, exposing them accurately and developing them correctly, that the gelatine film has loosened itself in part from the glass backing and begun to pucker or frill. This trouble is more likely to occur in hot weather than at any other season, and that is just when a man is most likely to use his camera. A number of recommendations have been made to help obviate the evil. Some experts advise using iced water; others say that certain chemicals added to the developer, or fixer, will serve as a preventive. Lately, however, some plates have been invented which, it is said, will stand a temperature of 212° Fahr. without frilling. The editor of the *Photographic Times* declares that he has tried them in water having a temperature of from 140° to 160° with great success, and that is much hotter than the liquids any photographer ordinarily uses even in summer.

A DISPATCH from New Haven, Conn., says, all reports to the contrary notwithstanding, the arms companies in that city expect to reap a rich harvest from the shipments of weapons for the Oriental war. Two weeks ago a test case was made by the Winchester Company. Two members of the Chinese legation visited the factory of the company, bought a large order, which was shipped for China via Vancouver immediately, and the action of the Government was awaited with anxiety. None has been taken, and it is now believed that free shipment of arms to the belligereuts from the United States will not be interfered with.

THE Minas de Tajo mines, located about eighty miles from Mazatlan, a Pacific seaport town of Mexieo, have been worked coutiuuously siuce 1536. They now have forty miles of tunnels, and are working 900 meu.

THE French Academy of Sciences has the sum of $10,000, to be awarded the iuventor of a simple and sure method of determining fraud practiced iu the production of alcoholic liquor for human cousumption.

COREANS are credited with building the first ironclad, about 300 years ago.

IN 1893 the total value of the mineral production of Canada was $19,250,000.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 6, 1894.

The oscillations of the week's silver pendulum were slight, the fact that the market held its own being taken as evidence of strength. Japan is importing large quantities of silver for coinage. For the 90 days ending June 30th the Japanese mint received over 10,000,000 ounces foreign silver, and is turning out over 100,000 yen daily.

In the twelve months ended June 30, '94, there was exported from this country to Hong Kong $8,812,054 of silver coin and bullion, and to Japan $4,074,547 of silver. That was sent from this city. From New York in the same period was sent $36,557,045 of silver coin and bullion, of which $35,107,908 went to England. New York silver trade with the Orient generally is via England, and therefore how much of that $35,107,908 went to China and Japan cannot be statistically given. Probably of the whole amount of silver exported $11,250,000 consisted of Mexican dollars. Silver has been, comparatively speaking, scarce in the Orient since the closing of the India mines. It is for that reason that the Hong Kong and Shanghai Banking Company recently requested permission from the British government to coin some more silver dollars. The Hong Kong dollar, as it is called, is worth four cents more than the United States silver dollar, eight-tenths of a cent less than the Mexican dollar, and one cent less than the old trade dollar. The Mexican silver dollar is therefore worth 4 8-10 cents more than the United States dollar, on the assumption, of course, of the parity of the American dollar. United States exports of silver to England in the year ending June 30, 1894, exceeded those of the previous year by about $10,000,000. United States exports of silver to Japan, however, were about the same. English statistics show that for the six months ending June 30, 1894, the exports of silver from England to China (including Hong Kong) amounted to £2,132,458, as compared with £187,290 for the corresponding period last year. The exports of silver to Japan from England for the six months ending June 30, 1894, were £573,300, as against £462,700 for the corresponding period in 1893.

An unlimited demand for Mexican dollars is reported in London. The London *Times* is authority for the statement in its issue of August 22d, that there are no supplies of Mexican dollars there; at any time during the last sixty days they could have been sold at from four to ten per cent premium on silver.

During the fiscal year the United States gold coinage was $99,599,911—the largest in the history of the nation. The silver coinage for the year aggregated $5,879,490.

The net exports of gold from July 1, 1893, to July 1, 1894, were $4,500,000. The gold production of the country for the same time was about $36,000,000, being 2,955,000 increase over the previous year. From this may be deducted $13,000,000 used in the arts. On this basis there is a net increase of $18,500,000, making the total supply of gold for monetary uses in the United States $682,775,335. This country exceeds in the magnitude of its gold supply all other countries but France, which has upward of $800,000,000. Germany and Great Britain have each about $600,000,000.

There is little new to report in lead, copper or tin. The peculiar methods of the New York Metal Exchange, given at length in last week's issue, regarding the manipulation and withholding of the prices current of lead, are as yet unforgotten but unexplained.

Reports from all the producers of lead in the United States to hand to-day, furnished by the United States Goverment Mining Statistics Bureau, show that the production of that metal has been as follows during the first six months of 1894:

	Net tons.
Desilverized lead	86,772
Soft lead	15,610
Total production refined lead	102,382
Refined in hond	21,382
Available for home market	80,990
Contents of Mexican and Canadian ores	9,786
From American sources	71,204

Included in the above desilverized lead are 2375 tons of hard lead produced in the first half of 1894, as compared with 2401 tons of antimonial lead during the first half of 1893.

The most striking feature in the statistics presented is the heavy falling off in the quantity of lead drawn from domestic sources. It proves that the decline in the price of lead and the prostration of the silver mining industry have seriously affected the lead industry of the Rocky Mountain States and Territories.

The stocks of lead in refiners' hands have only been partially reported. Those received show a total of 2655 tons on July 1, 1894, as compared with 2468 tons on January 1st. The stock of soft lead was 2060 tons in the beginning of the year as compared with 1880 tons on July 1, 1894.

Quicksilver escaped the blight that some California industries suffered from the new tariff, the $5 a flask duty representing to the producer that amount of protection for his home product. The price, local, remains at $36.

New York Prices.

NEW YORK, Sept. 6.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.	Copper.	Lead.	Tin.
Thursday	30¼	66⅛	....	....	.....
Friday	30¼	65¾	9 15	3 20	19 50

The coal market is dull. From Jan. 1st to July 1st, '94, 336,231 tons bituminous coal have been imported. The yards are all full and 127,438 tons are engaged to arrive. The general holding off from buying makes business stagnant, it being the universal belief that in December Congress will take off the duty retained on coal in the bill just passed.

Mining Share Market.

SAN FRANCISCO, Sept. 6, 1894.

While the encouraging appearance of some of the Comstock mines is ackuowledged on all sides, their good condition has little to do with the stock, not near so much as the general absence of coin from the street. The Gold Hill end showed considerable strength during the week, and it is thought the resumption of the mills next week will be of good effect. The Con. Cal. & Va. during August furnished the Morgan mill 2497 tons of ore, which yielded $23.66 gold and $32.39 silver to the ton; $59,092 gold and 80,907 silver, a total of $139,999. The average assay of the car samples was $64.15, and of the battery samples $56.28.

During September $143,400 assessments are called for. Of this, the Comstock asks $95,400; Arizona, $30,000; Mexico, $4000; California, $14,000.

On the 3d the following reported cash balances on hand as annexed:

Alpha	$5,031	Julia	$668

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUGUST 28, 1894.

525,067.—GRAIN SEPARATOR—Bailey & Gilson, Sheridan, Or.

525,127.—SQUIRREL EXTERMINATOR—T. R. Barney, S. F.

525,130.—MOTOR—J. H. Boyd, Waterville, Wash.

525,062.—WATER-WHEEL—P. S. Buckminister, Angels, Cal.

525,096.—CULTIVATOR—R. V. Dorsey, Watsonville, Cal.

525,097.—TILE CONSTRUCTION—J. A. Flint, S. F.

525,100.—CAN-HEADING MACHINE—J. Gould Jr., S. F.

525,104.—WATER CLOSET—S. S. Herrick, S. F.

525,300.—ROPE-DRIVING APPARATUS—J. H. Houdley, S. F.

525,112.—FRUIT CRATE—R. E. Morey, Oakland, Cal.

525,154.—SHOE AND GLOVE BUTTONER—Ida E. Mnshette, Oakland, Cal.

525,122.—BOOM FOR LOGS—W. F. Stevens, S. F.

525,244.—FLUSHING APPARATUS—F. Walker, Los Angeles, Cal.

525,065.—DECAPPER—W. A. Wright, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT CARRIER.—Isaac B. Wollard, San Francisco, Cal., assignor to Wm. B. Lake, of same place. No. 524,625. Dated Aug. 14, 1894. This invention relates to a carrier for fruit, eggs and other fragile, delicate or perishable substances. It consists of a series of compartments having inclined elastic sides and elastic pieces extending above and below the compartments so that the fruit is properly held within these compartments and prevented from shaking from side to side or coming in contact with the fruit in the adjacent compartments. Dove-tailed slots in the partitions, running in one direction, serve to receive those extending across them, and they are secured by locking strips. Each series of these partitioned chambers is separated from those above and below by horizontal partitions, perforated so as to allow a free ventilation th ough the whole case.

MEANS FOR TREATING CITY REFUSE.—E. L. Ransome, Oakland, Cal. No. 524,688. Dated Aug. 14, 1894. This invention is designed to neutralize the cinders which are produced by burning city refuse in furnaces constructed for the purpose. It consists in breaking, regulating the fall of and crushing the burned material antomatically and contemporaneously with its removal from the furnace. The apparatus consists of a furnace of considerable diameter and great height within which the material is burned, and the breaker is in the form of a grate situated in the lower part upon which the clinker formed by the burning descends. Through this breaker adjustable bars pass fixed at an angle, and the breaker itself is rotated slowly by power applied to it in any convenient manner, so that the projecting bars will engage the clinker and break it up into smaller parts, which afterward fall through to separating and distributing devices below.

ATTACHMENT FOR ARTESIAN WELLS.—Francesco Cavallaro, San Jose, Cal. No. 524,666. Dated Aug. 14, 1894. This invention relates to attachments for artesian wells. The object is to provide a means for hermetically closing the tubes of the wells so that, in the case of a flowing well, the water may be stopped at any time, and in case the well has to be pumped, the well tube itself will serve as an extension of the suction pipe of the pump. It consists of a disk and expansible collar adapted to fit the interior of the well tube and an expander and mechanism whereby it is moved to expand the collar or allow it to contract, a pump suction tube extending down through the disk upon which the expander is slidable, a valve or plug, guides below the disk upon which the plug is movable, and a screw engaging a nut and adapted to move the plug to close or open the bottom of the pump tube, and screw shanks extending upwardly by which the expander is adjusted.

BOOM FOR HOLDING AND TOWING LOGS OR TIMBERS.—W. F. Stevens, Sau Francisco, Cal. No. 525,122. Dated August 28, 1894. The object of this invention is to provide a simple and effective device for holding together well a mass of logs or timbers and towing them to their destination. The boom is composed of short, longitudinally-bored logs, connected in a series by an endless chain passing through their bores and provided with adjustable stops for regulating the spaces between the boom logs. The logs or timbers to be towed are confined loosely within the boom which being moved carries them along.

FIREPROOF TILE CONSTRUCTION FOR WOODEN BUILDINGS.—J. A. Flint, San Francisco, Cal. Assignor of one-half to P. J. Horan of same place. No. 525,097. Dated August 28, 1894. In this construction hollow tiles are used. The wooden supports, such as the studding, the joists, or the rafters, have secured to them on opposite sides, cleats and also guide pieces separated from the cleats by a space. Into this space the back walls of the hollow tiles fit, their front walls being separated from the faces of the supports and the guide pieces by an air space. Thus the tiles are fully separated from the wood at all places where heat could be communicated.

Wanted!

A GOLD MINE

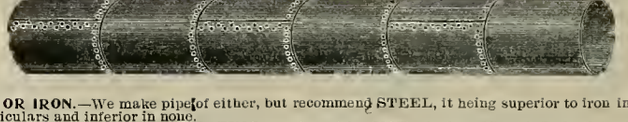
No properties but those which will bear strict investigation will be entertained. Parties having good gold prospects will kindly correspond with

Pacific Mining Agency and Trust Co.,

Rooms 1 and 2, Ninth Floor, Mills Building, San Francisco.

W. C. RALSTON, Secretary.

Mining Pipe!



STEEL OR IRON.—We make pipe of either, but recommend STEEL, it being superior to iron in many particulars and inferior in none.

COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Maltha.

Union Gas Engine Co.

Pioneer Manufacturers

Of Gasoline Engines and Owners of Twenty Patents on Same.

ENGINES FOR MINING PURPOSES A SPECIALTY.

WARNING!

If you are in need of power for mining purposes investigate this engine and take no other. Many so-called gasoline engines are now on the market, which are direct infringements of our patents and it is our intention to bring suit against the various infringers. As the law holds the purchaser, as well as the manufacturer, we would advise parties who have already purchased other gasoline engines to obtain from the sellers of such engines a good and sufficient bond protecting themselves in case damages are obtained against them, as it is not the policy of this company to work a hardship on innocent parties, but the law makes no such provision.

MINE BELL SIGNALS

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12 X 36 INCHES, THE MINE BELL SIGNALS AND RULES PROVIDED FOR IN the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market Street, San Francisco, Cal.

VOLUME LXIX. Number 11. SAN FRANCISCO, SATURDAY, SEPTEMBER 15, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Austin Dam.

The dam across the Colorado river, at Austin, Texas, which has recently been completed, is a work of great magnitude and of much scientific and practical interest. Fig. 1 showing the water pouring over the dam is made from a photograph taken a short time before the work was finished. This dam holds back a body of water forming a lake twenty-four miles long, furnishing water power that will add much to the future importance of Austin as a manufacturing center.

The survey for the dam began in May, 1890. The contract for its construction was awarded in October of the same year, and the work of excavation was commenced at once. The first stone was laid in May, 1891, and the dam is now completed. It is 1150 feet long, 68 feet in height, 66 feet wide at the base and 16 at the top, cost about $608,000, and will furnish 14,500 H. P. for sixty hours per week. Both up-stream and down-stream faces are constructed of granite, and the interior is of limestone, all laid in Portland cement mortar, three parts sand to one of cement.

In the construction of the dam, an overhead cableway, 1850 feet long, with a span of 1350 feet, was used—the longest span of the kind ever operated. The cable was two and one-half inches in diameter, and was suspended from towers on the bluffs on opposite sides of the river, the easterly tower being considerably higher than the other. The granite and other material were hoisted from a railway on the eastern side to the cableway and moved to the desired part of the dam by means of a suspended carrier operated by a hoisting engine in the eastern tower.

The power house is situated at the eastern end of the dam, water being taken from the lake through eight nine-foot penstocks, some of which are shown partly completed in the engraving. The power plant is 24,000 H. P. There are two pairs of 4,000,000-gallon pumps, the latter to furnish water for a 100,000,000-gallon reservoir for the city water works. A pair of the turbines are shown in the accompanying Fig. 2. They are on horizontal shafts, with two feeders and central discharge. This plant will furnish power for a complete system of electrical distribution for Austin, including lighting, street-railway service, and power for manufacturing purposes. The pumps are horizontal double-acting ones of the plunger type, having two pump cylinders to each pair. They are driven by two vertical turbines of 200 H. P. each, under 54 feet head, the shafts being connected to the pumps by bevel gears.

The cost of the entire work, including reservoir, distribution system, power house and dam, is not far from $1,400,000, the pumps and turbines alone costing $70,000. About forty miles of pipe, ranging in diameter from two feet to six inches, were required in the distribution system for the city water works.

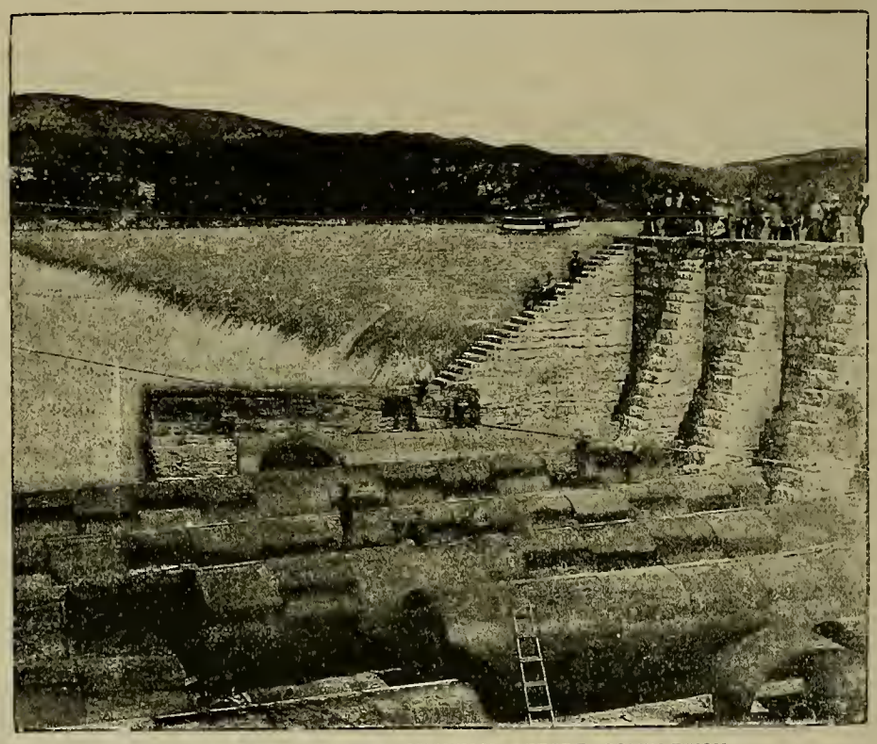

Fig. 1.—THE AUSTIN DAM SHORTLY BEFORE COMPLETION.

Fig. 2.—TURBINES AT THE AUSTIN DAM.

BABBITT METAL, or what is called "babbitt metal," like wine or saleratus, can be made at any price, but what may be styled genuine babbitt metal is of standard make and definite components. Among a variety of formulas it is believed the following meets all the requirements of genuine babbitt metal: Melt separately 4 parts copper, 12 Banca tin, 8 regulus of antimony. After fusion add 12 parts tin. The antimony should be added with the first portion of the tin, and the copper added after taking the melting pot from the fire. The surface of the charge should be protected from oxidation by a covering of powdered charcoal. This mixture constitutes the "hardening," and the babbitt metal is made by fusing one part of this "hardening" with two parts of tin, thus making the metal consist of 3.7 parts copper, 7.4 parts antimony and 88.9 parts tin.

HORSES are slow of sale in California just now, in some cases it being found difficult to give them away. Apart from the price of feed, the law of supply and demand has a good deal to do with it. In slow-going Philadelphia the electric street railway is being introduced, and in time the horse market there will be as dull as elsewhere. An accurate estimate of the number of horses in the various Philadelphia street car stables indicates that from 12,000 to 13,000 animals will in all have been thrown upon the market after the electric wire has been generally substituted. On an average, 120,000 pounds of long hay and at least 114,000 pounds of cut hay is consumed.

THE Queensland, Australia, government has voted £10,000 for deep sinking on various mining fields in that colony.

CONGRESSMAN CAMINETTI has not lost hope of the ultimate success of his restrainiug dam proposition, the appropriation for which was stricken out of the last river and harbor bill, aud says that members of the Senate aud House committees will be out here next November.

"CAN gold be found iu payiug quantities in a volcanic couutry?" asks a San Bernardino man. That depends. The consensus of scientific opinion is that gold is almost if not quite unknown as a volcanic product. It is believed that gold, when found in a volcanic country, is there rather iu spite of than because of the volcanic character of the country.

EVERY paper in the mining counties of the State chrouicles uuusual activity in mining matters—old locations chauging hauds at fair prices; large quantities of improved machinery being put in; new discoveries makiug; and a general spirit of energy and hopefulness pervading every section. Quartz and placer districts are alike lively, and without any rush or hurrah there is a geueral resumptiou of the mining industry all over the State.

LOUIS JANIN, JR., left London on the 1st inst. for Victoria, N. S. W., with a view of iutroducing modern American improvements into Australian gold mills. Believing that uo single type of treatment is suited to all ores, it is his purpose to introduce new processes where he cannot improve npon existing ones, the greater portion of his work being inteuded to add American improvements to already existing plants without materially altering the systems there in present use.

REPORTS from Western Australia, where it is asserted gold is lying iu chunks waiting to be picked up, indicate considerable anxiety on the part of many to be the first there. That anxiety is said to be shared by some possessed of surplus funds with whom the "promoter" is having present financial enjoyment. It is to be hoped that every word of the glowiug accounts is true, and yet, at this distance, or any distance, the reports must be largely discounted. Shonld there be no result of disappointed gold seekers and ruined investors, the usual history of such sudden El Dorados will have been reversed. Of conrse our Australian friends will not fail to recognize the usual percentage in favor of the game.

One Reason.

It is often asked why so many of Califoruia's useful minerals are not more completely utilized. It is a question easier to ask than to answer, the reasons are so mauy and covering so wide a field. Throughout the great area of the commonwealth, beside the gold, silver, quicksilver, lead, coal, copper and iron, are found asbestos, antimony, asphaltum, borax, cement, chromium, fire clay, gypsum, manganese, marble, magnesia, mica, petroleum, salt, soda, sulphur, etc., etc. It must not be supposed that, apart from the precious metals, the mineral wealth of the State has been overlooked. Much has beeu done and is doing in the way of development and manufacture. Apart from the questions of wages, transportation, quality, production, demand, and other factors that enter into the equation, seems paramount the question of profit.

Twenty years ago the question was raised, why had the United States so completely abandoned the ship building business; the carrying trade; the ocean freight traffic. Like other business questions it was run into politics and found place in partisan platforms. Looking at that question in the light of history it would seem that American capital abandoned so completely the ocean carryiug trade becanse the money could be made earn twelve per cent in railroad building and inland development when it would earn but four per cent when put into marine architecture. That railroad building, land plattiug, townsite industry has received a check. The days of rapid railroad building are now looked upon as a past era.

Similarly, it is believed, the reason for the neglect of some of our State's natural mineral resources was simply because money was to be made quicker and plentier in other pursuits. No sooner had the first goldeu flood begun to slacken than there came a silver shower from the other side of the Sierras that distracted atteution from the smaller rills that feed the river of the State's mineral wealth.

"Despise not the day of small things," was an adage not generally observed by Californians. In overturuing hills, changing river beds and tunnelling mountains, the Californians of the era now passing away had no time to develop minor sources of mineral wealth that yet await successful working.

Many of these mineral resources still await the manufacturing epoch, which with less expectations on the part of both labor and capital will take its place in the State industrial calendar.

These mineral resources are not only varied but widely aud evenly distributed, and are unusually easy of access. Of a uew mining camp in Nevada it used to be said that "it ought to be good, 'tis so hard to get there." In Mexico and South America the best mines can only be reached by steep and difficult trails. In California the principal gold belt has an average altitnde of 2000 feet, and it is a well-known fact that oue of the chiefest charms of residence in the gold districts of this State is the beauty of the climate and the ease of access.

The wide distribution of the mineral resources of California is remarkable. Every county in Califoruia has valuable mineral deposits. In 35 of the 57 counties gold miues are in operation, and in ten of these counties are gold and silver mines. Quicksilver is found iu Santa Clara, San Luis Obispo, Napa, Lake, Sonoma, and, it is believed, in Trinity. These are the ouly cases where cinnabar ore is worked in the United States.

What is said of the mineral resources of this State applies with equal force to Nevada, Arizona, Oregou, Utah, Montana and Idaho. Upon the successful development of those mineral resources depends the growth of other industries and the general prosperity of the coast.

AT a meeting of the Technical Society of the Pacific Coast on the 7th inst., Mr. H. B. Bestor read an article on "City Tenemeuts," and Mr. R. L. Dunn read a paper ou "The Relation of Transportatiou to Production," which elicited considerable interest and comment. The central idea was that some way should be adopted to change the present custom, which according to the deductions in Mr. Dunn's article, gives transportation half the amount received for California's agricultural and horticultural products.

Statistics of the Currency.

A statement has been prepared at the Treasury Department giving the amount of specie and banknote aud paper circulation of the United States iu years specified from 1800 to 1859. From the latter year the figures have formed a part of the report of the Secretary of the Treasury.

The estimated specie at the beginning of the century was but $17,500,000, and the total of all kinds of mouey was but $28,000,000. The population was then only 5,308,483. The specie iu 1835 had increased to $51,000,000, and all kinds of money to $154,692,495, and the population to 14,786,000. The table shows the per capita circulation as follows:

Year.	Per Capita.	Year.	Per Capita.
1800	$4.99	1861	$13.98
1801	7.60	1862	10.23
1820	6.96	1863	17.84
1830	6.69	1864	19.67
1831	7.04	1865	20.57
1832	8.64	1866	18.99
1833	8.60	1867	18.28
1834	8.64	1868	18.39
1835	9.86	1869	17.60
1836	13.17	1870	17.50
1837	13.87	1871	18.10
1838	12.33	1872	18.19
1839	13.26	1873	18.04
1840	10.91	1874	18.13
1841	10.50	1875	17.16
1842	9.02	1876	16.12
1843	7.87	1877	15.58
1844	8.68	1878	15.32
1845	8.95	1879	16.75
1846	9.43	1880	19.41
1847	10.50	1881	21.71
1848	10.66	1882	22.37
1849	10.34	1883	22.91
1850	12.02	1884	22.65
1851	13.76	1885	23.02
1852	14.63	1886	21.82
1853	15.80	1887	22.45
1854	16.10	1888	22.88
1855	15.34	1889	22.52
1856	15.16	1890	22.82
1857	15.81	1891	23.41
1858	13.78	1892	24.44
1859	14.35	1893	23.85
1860	13.85		

THE weekly accounts in these columns of the investment of capital in gold mining properties all over the State indicate from the character of the property bought that undeveloped mines meet with ready sale. Owners who have a bullion-producing mine don't want to sell; as a rule their mine is not on the market. Holders of "prospects" or undeveloped properties realize that it is idle to hold at prohibition high figures. Capital, generally, finds more present profit in mines than in other forms of investment, aud sees opportunities for placing idle capital where it will meet with good returu. It has beeu customary (more especially with English investors) to decline taking hold of anything but "a going concern," but now-a-days "a coming conceru" is not overlooked. And, in general, where due care is exercised, the element of risk in buying a mining claim to develop it, is very small; and where every appliance for working the mine is so cheaply procurable as in this State, it is no wonder that the gold claims of the State are being so rapidly picked up by iuvestors.

COMMENTING on hard times and their causes, the Oaklaud *Tribune* cites the Sawyer decision which stopped hydraulic miniug in the Sierras. That decision drove thousands of miners out of the mountains, emptied miuing towus of their inhabitants, left property which had cost over one hundred millions of dollars to develop to go to wreck and ruin, and lopped off about ten million dollars from the annual income of the State. The State has thus, through that one industry, lost a total sum to date of about $150,000,000. During the last year or two the revival of quartz mining has brought to the State an increased income of between $3,000,000 and $4,000,000 annually, thus reducing the loss chargeable to judicial interference with mining operations to $6,000,000 or $7,000,000 per annum; that is, the State is still the latter amount out in its annual income from the miuing industry as compared with what it was deriving from it before the debris decision stopped the hydraulic mouitors.

CONCERNING the project of a railroad from Los Angeles to Salt Lake, S. T. Godbe, interested in the Nevada Southeru, is reported as denying that I. S. Trumbo or J. S. Clarkson have anything to do with it, but that after southern Nevada and Utah interests are consolidated a compauy, called the Utah-Nevada Company, will be formed with a capital of $6,000,000, to hold iu trust the most valnable mining properties of that entire region, and will begin building south from Milford. President Blake of the Nevada Southeru, H. B. Claflin of New York, and J. R. DeLamar of Denver are said to be backing the scheme.

Concentrates.

THE Merrimac mine near Glenbrook is to be reopened and thoroughly developed.

THE Holcomb Valley Mining Company has incorporated in San Bernardino with $1,000,000 capital.

MEN in Metaline, Stevens Co., Wash., claim to have discovered a limitless quantity of Portland cement.

THE Yreka *Journal* says a Klamath river wing-dam claim paid $140,000 last seasou in a sixteen-months' run.

THE miners at the Robbins-Elkhorn mine, near Baker City, Or., have struck for a raise from $2.50 to $3 a day.

THE Boa mine in Timbuctoo district, Yuba county, recently bought by J. D. Redding, is to be developed this fall.

THE sale of the French Hill mines, near Plymouth, Amador county, is reported to involve a purchase price of $140,000.

THE San Francisco mint coined $300,000 standard silver dollars in August, and will increase that aggregate in work this month.

LAST Saturday the Mercur Company, Utah, declared its customary bi-monthly dividend of 12½ cents per share, or $25,000 in total.

THERE is a resumption of work in the Webber mine, at the south end of Lake Pend d'Oreille, known as the Chloride district, Idaho.

AUSTIN, Nev., is picking up, and if silver improves a little in price, or even remains stationary, the forces in the mines will be increased.

A 1000-FOOT TUNNEL is to be run on the Rusb mine, near Loomiston, Wash., to tap the vein at a depth of 500 feet, when it is intended to build a mill and turn out bullion.

THE New London property, near Plymouth, Amador Co., has been transferred. The new owners have bought the old Pacific company's machinery, which is being put in place.

THIRTY men are at work at the Rosemond copper camp between Benson and Tucson, Arizona. Some extensive ore bodies have been uncovered. A forty-ton smelter is on the ground.

THE old Carr mine and the property of the Blythe estate in Trinity county will be worked by J. G. Mather this fall and winter. The group has recently been acquired by an English company.

BODIE mining companies had cash on hand as follows on the 1st inst. Bodie, $28,898.19; Bulwer, $5124.77; Mono, $1677.51; Standard, $28,974, with $1503.21 in unsold bullion on hand; Syndicate, $901.36.

A PIONEER who has been reading of the sufferings induced by thirst in crossing the deserts, writes that he has always found relief in those arid regions by carrying a small piece of alum in his mouth.

AT Perris, Riverside Co., the Santa Fe and Santa Rosa companies are each building a stamp mill. Considerable work has been done on each mine. The Santa Rosa was formerly the property of Gov. Blasdel, of Nevada.

THE Midway, B. C. *Advance* says that owing to the duty on mining machinery the smelter for the Boundary Creek District will likely be constructed on the Colville Reservation, across the line, when that is thrown open for location.

J. B. MCLAREN, S. F. Scott, Robt. Hughes, and G. D. Mackay are trustees of the Anglo-American Gold and Platinum Hydraulic Mining Company, limited, with $250,000 capital stock in $5 shares. Principal place of business, Vancouver.

AT the Socorro placers, Bajn California, where thirty claims are being developed, a ditch is building from a stream on San Pedro Martir range. The ditch will be eight miles long. Half of it is finished, and it is expected to be completed in four months.

CRIPPLE CREEK miners are complaining of the high rates charged by the railroads for hauling ore to Denver and Pueblo. The railroad companies are earnestly advised that they are hindering the progress of the camp and consequently their prosperity.

BRITISH COLUMBIA claims to have given £10,000,000 to the world's gold output with the pan, cradle and tom. Large companies are now organizing in various parts of British Columbia's placer districts to do hydraulic work on an extensive scale.

THE Arnett Creek Gold Mining Company which is operating the Italian group of mines near Salmon City, Idaho, has recently completed the erection of a ten-stamp mill. On a trial run of sixty-five tons of ore a $900 brick was obtained. The company is well satisfied with the result.

THE Tolo Mining Company has been incorporated at Tacoma, Wash., by Wm. H. Reid, John B. Cromwell, James C. Fairchild, John L. McMurray and Peter Daley, managers of the Tacoma Smelting Works, with a capital stock of $50,000. The object is development of mining property, etc.

COUNT DES GARETS is interested in a new ore reduction process and has erected an experimental plant in Denver. "The process is a secret and originated in Russia." The Poorman Company will send 500-pound sample lots of its different character ore to Denver for treatment by this process.

THE Belle Gold Mining & Milling Company of Salt Lake City has incorporated with a capital of $1,000,000, divided into 200,000 shares, at $5 each. The company will operate the Bahy Ellen, Joe Dandy, Fanny, Rattle Snake and Splendid mining claims, situated in Osceola mining district, White Pine county, Nevada.

TWO HUNDRED men are at work at the Congress mine, Arizona. The twenty stamps on the mill are working steadily. The company is building a large lodging house for its men, which will be given them the use of free of cost. The old hoisting works are being used, and development work is continually going on.

W. A. SHAHAN, of New Whatcom, J. E. W. Macfarlane, and J. W. Campion, of Vancouver, are incorporated as the British Columbia Gold Dredging Company, capital stock $1,500,000. Principal place of business, Vancouver. Object, to engage in hydraulic mining or dredging for gold chiefly, in addition to all other departments of mining.

MANAGER CHAS. CURTIS of the Gold Hill Mining Co., at Deep Creek, Utah, is charged with appropriating bullion and amalgam worth $5000, sending it to the Mint here and spending the proceeds in riotous living. He offers to dig up some buried bullion and divide with the detectives if they'll let him go, but the inducements are not sufficient.

THE Bald Mountain Extension Company, near Downieville, has concluded not to use a boring machine, but has bought an electric plant to pump out the water and hoist gravel in the lower part of their mine, to be run by steam power. All the machinery is on the way from San Francisco and the East, and breasting will be resumed in a few weeks.

HEARING in the McBride mineral case, in which McBride claims valuable Washington school land for gold properties, assumed a sensational phase last week at Olympia, Wash., when G. W. Bloom of Tacoma, a miner employed by the State during the investigation, testified that McBride offered him an acre of land or $3,000 if he would salt the ground heavy enough to win the case.

THE Helvetia mine, at Julian, San Diego county, Cal., formerly the property of W. O. Havermale, is being worked again. Mr. Havermale, who is dead, was spending large sums of money upon it when his operations were stopped by the failure of the California National Bank three or four years ago. The mine has not been touched from that day until a few weeks ago. It is a rich property.

ON the 1st the Centennial-Eureka Mining Company of Tintic, Utah, declared dividend No. 56 of fifty cents per share, aggregating $15,000. Within a period of fifty-six months this property has paid a total of $840,000, or $28 per share. The stock is held at $34. This is one of the few properties in Utah, in fact in the West, that throughout the depression in mining circles has continued to pay regular dividends.

COL. T. B. EVERETT is getting on finely with his new machinery on the placers west of Cripple Creek. The *Journal* says the new machinery just put in operation on the placers west of town is running smoothly. Teams are employed in scraping the dirt to the machine, which absorbed as rapidly as delivered. The capacity is 200 tons a day. The value of the ground was estimated to produce fifty cents to the ton.

THE directors of the Bullion-Beck Company, Utah, have declared a dividend of 50 cents per share, equal to $50,000 in all. This was done in spite of the fact that the company is preparing to construct a new mill at its mine, which involves an expenditure of $40,000. The latter action awaits the result of the test of the Bingham lead mill on a sample of 100 tons of ore which the Bullion-Beck Company shipped last Saturday.

THE Black Butte ledge in Grant county, Or., is 88 feet wide, five feet of which is worth $240, ten feet $40, and the remainder $6 per ton; 95 per cent of which is free gold. The formation is asserted to be porphyry. At present the development consists of a cross-cut tunnel, 240 feet cutting the ledge at a depth of about 60 feet. From this cross-cut a number of drifts have been run and about 60,000 tons of ore blocked out.

W. AND J. MCKINLEY of Duluth, and J. Charnley of Chicago, have sued the Lake Superior Consolidated mines for $620,000. They charge fraud and misrepresentations were used to induce them to sell the McKinley mine to the Consolidated Company. As a result of alleged misrepresentation, the plaintiffs parted with $800,000 worth of property for stock in the Consolidated not worth over $180,000. They therefore ask for the difference.

NOW THAT American scientists are searching for some metal that is heavier than lead for the manufacture of projectiles, and yet can be thrown a greater distance, the Nevada *Herald* thinks euproscheelite may come into use. Twenty-one years ago John B. Treadwell, the well-known mining engineer, found a deposit of euproscheelite in Keru county, Cal., when it was not known that any existed in this State. Scientific men recall it now.

ADAMS, FRAKES & MANN have put in a large hydraulic plant at the junction of Silver and Ward's forks in Elliott creek district, Jackson county, Or. The ground is rich in coarse gold, pieces ranging from $5 to $15 being frequently picked up. Work has begun on the ditch to be built by Boggs & Haney on Elliott Creek. It will have a capacity of 2000 inches, and will afford water for four six-inch giants for six months in the year. The claim consists of eighty acres of rich ground.

THE mine on the summit of the Huachucas, Arizona, being worked for the glory of the Lord and the advancement of His cause, by a detachment of the Salvation Army, is turning out large quantities of good ore. This is probably the most unique mining camp and outfit in the world. The profits of the mine, after the payment of expenses, go to the treasury of the Salvation Army to aid in the great work of that organization. There are sixteen men at work at the mine, all members of the army, and religious discipline is maintained.

THE articles of incorporation of several mining companies have just been gazetted in the last number of the British Columbia *Gazette*. The Alamo Mining Company, limited, starts with a capital stock of $500,000. Chief place of business, New Denver. The Minnesota Silver Company has a capital stock of $1,000,000 in $1 shares. Chief place of business, New Denver. The Slocan Milling Company has incorporated, capital stock of $100,000, New Denver chief place of business. Object, to carry on the business of marketing, milling, concentrating and refining ores.

TIERRA DEL FUEGO, the extreme southern point of the American continent, is the latest locality in which rich gold finds are reported. It is a hard country, but said to be profitable to those there. The gold is found in the black sand washed up by the tide in the same general way as at Gold Beach, Cal., and elsewhere along the California and Oregon coast. The usual big stories that accompany alleged gold finds in far-off places are told of securing 37 pounds of gold in two weeks. That inhospitable part of the globe has long been a gold yielder. In 1853 it produced some gold, and in 1866 there was considerable interest manifested there, several thousand claims having been disposed of.

LEMHI COUNTY, Idaho, has the second largest placer mining enterprise in the United States—the Lemhi Placer Mining Company, whose property is located on Kirtley creek. This property shows from 15 to 100 feet of pay gravel, and it covers 4000 acres. The company has a ditch reaching the ground from Carmen creek, which gives a head of 350 feet. It is operating two nozzles, one of which is nine inches and the other seven inches. Under such a head, streams of this size tear away the ground at a rapid rate, but still it is estimated that it will require fifty years to wash out all that the company owns. The Carmen creek ditch does not furnish water enough to enable the company to carry on operations as extensively as it wishes, and it has therefore surveyed a second canal to be taken out of the Lemhi river, carrying the water forty miles to the scene of operations. This ditch will involve an expenditure of about $500,000.

THE *Democratic Banner* says a syndicate of capitalists has purchased all the mining property on the mother lode from Robinson's ferry to Mormon creek, a distance of some three and one-half miles. Carroll McTarnahan, the county surveyor, is now engaged in making maps and surveys of the property. This is one of the most important and largest mining deals that has ever been made in Calaveras county, and as the purchasers, among whom is Senator Wolcott of Colorado, are men of immense means, there is no doubt about them entering into extensive operations in that part of the county. The company will be known as the Montreal Mining Co. The price paid was $150,000.

THE old camp of Sanger, northeast of Baker City, Or., promises a revival of placer mine working, recent discoveries of gold deposits in gravel beds promising rich returns. Sanger, known in years agone as Hogem, has been worked for its placer deposits, and the yield in the aggregate has been enormous. Hogem, during the years from 1865 to 1867, was one of the richest placer camps in eastern Oregon. Money was plentiful and ounce diggings were not unusual. But Hogem underwent the change of all the camps. The placers were worked out and the followers of the pan and rocker moved on, other fields to explore; those who remained turned their attention to quartz mining and with fair success.

BESIDE the recent sale of the Mammoth mine for $80,000, three other mining sales are reported from Tuolumne Co. The Viertong group of four claims at Tattletown is sold to Montreal men for, it is said, $140,000. By the conditions of the sale a 40-stamp mill is to be built this year, which is to have its capacity increased to 100 stamps by the middle of '95. The Black Oak and Live Oak gold properties at Soulbysville have changed owners, the consideration being $108,000—$25,000 cash; the remainder in installments. The 10-stamp mill now there is to have 10 added, and considerable building and development work will be done. The Seminole group at Summerville is reported sold to John Coles of San Francisco for $110,000.

A RECENT rumor that the Utica mine had closed down for two months was without foundation. The mines that closed down are the Madison and Gold Cliff mines, owned by the same company that owns the Utica. Those are small mines at some distance from Angels and they were closed to save water for the Utica. The company has dams in the mountains for impounding water, but during the summer season the water began running low and it was found necessary to save it some way. Instead of shutting down, the Utica is running bigger than ever. The output is expected to be extraordinarily large during the next two months, exceeding the usual $200,000 monthly. As soon as the rains commence and there is more water for the company the two mines shut down will be started up again. At present the Angels mines are both running, the Utica and the Stickle mine.

A CORRESPONDENT of the Phœnix, Arizona, *Herald*, writing of the Yarnell mine, says: The new management attempted to do without stamps, and resorted to a chlorination plant that cost the company dearly. The chlorination sharp has taken his departure, and the mill is running on ten stamps and is fast paying up the debts. The mill is working on the Mother Lode, an adjoining property to the Yarnell. D. D. Murphy, foreman of the mine and an old California miner, soon after going to Yarnell found on examination that the large ledge of what appears to be brown sandstone carries gold. This rock lies piled up on top of the ledge. A ledge has been exposed of four feet on the Mother Lode. This claim was given Mr. Biedler by Mr. Murphy provided he would work it. It is this property that is paying up the debts of the old management and developing the adjoining properties. The ore comes out in blocks similar to that in a quarry, and is taken to the mill for about $1.10 per ton. The mill is working every twenty-four hours twenty-five tons. The ore averages $8 per ton.

THE official figures of the Branch Mint at Denver show an increase in the gold received from the Colorado mines for the month of August, 1894, over that of one year ago of 203 per cent. The increase for each month so far in 1894 over the same month of 1893 has been from 100 to 400 per cent. The gold output of Colorado in 1893 was about $7,000,000; with 100 per cent increase will make the yield for 1894, $14,000,000; with 200 per cent increase would make it $21,000,000. The gold receipts from the placers will gradually grow less as cold weather approaches, but the lode mines will increase. New and rich discoveries are daily being made in some portion of the State. A body of ten feet in width of gold ore is reported in the Old Kentucky lode, in the new Silver Lake district, near Central City; also discoveries are reported in Pine Creek, Yankee Hill and Empire districts of Gilpin and Clear Creek counties. New finds at Cripple Creek are extending the producing territory of that camp. Finds at Telluride, Goose creek, San Juan, La Plata mountains, Alma, Breckenridge and Boulder are proving the judgment and good work being used in prospecting and working the mines throughout the State.

Obituary.

DR. HERMANN LUDWIG FERDINAND VON HELMHOLTZ, the celebrated German scientist, the searcher in physics and physiology, the acknowledged Edison of the Old World and the inventor of a score of instruments which have revolutionized the surgery of the eye, died at Berlin last Saturday.

PICO PICO, the last Mexican Governor of Alta, or Upper California, died in Los Angeles last Tuesday in the 94th year of his age. He was born at the Mission San Gabriel in the first year of this century. He was Governor in 1845 and 1846, and fled to Mexico on the American occupation, returning at the time of the gold discoveries here, and resided in Los Angeles county for the last forty years.

Personal.

COL. A. J. BOWIE is in charge of the operations of the Lemhi Co.'s placer mines at Kirtley Creek, Idaho.

A. D. GASSAWAY, formerly of the Ruhy mine, Sierra Co., is superintendent of the West Harmony Gravel mine, Nevada Co., vice Jno. T. McCall, resigned.

The Gold and Silver Question.

Thomas Cornish, in the London *Mining Journal*.

After all the conferences, discussions and writiugs ahout this question, little progress to anything like a satisfactory settlemeut has heen made. It may he remembered that last year, at the July meeting of the London Chamher of Commerce, I hrought forward the following:

Resolved, That in the opinion of this meeting it is desirable a hasis of value as to the relative positions gold and silver should bear to each other should be estahlished, and that silver should bear a ratio with gold as a legal tender, and payments of indebtedness to the extent of ten per cent with gold; thus for every £100 of indebtness, hanks and other monetary institutions or iudividuals may have the option of £90 in gold and £10 in silver.

I said then, and cousider now, that this important question should he seriously considered hy gentlemen holding prominent positious in financial and commercial circles. The actiou of the Indian government in stopping the coinage of silver had already had a ruinous effect in depreciatiug the value of silver and many classes of securities.

There is a ridiculous hut current helief among the general puhlic who consider the question at all, that there is too much silver produced, and some even talk of gluts of gold that cannot he utilized, hut where are the individuals, communities or eountries that have enough of either gold or silver in coin? Have the workiug classes of this or any other country got an overahundance of money, or eveu the employers of lahor—or what are termed the capitalists? Nations and communities are complaiuiug of the scarcity of gold and silver, and all vieing with each other as to which can get the most of it. In fact, there is a general scramhle as to which nation can get hold of most coin,—that is, by coucentration from their ueighhors. Then, again, every small State—some of whom produce no gold—have the presumption to wish for a gold coinage and a gold standard. It would he interesting to know from whence they expect to get their supply. If they developed the natural resonrces of the earth they could in many places produce the gold they require, hut that would mean hard work to extract it from the matrix, and that is not agreeahle; they prefer horrowing or extracting it from other countries.

A ridiculous scare has heen created hy timid alarmists who have preached the doctrine that the world was heing flooded with too much gold and silver, hut how does that harmonize with the fact that no oue can he found who has enough of either of the metals? The mere fact that during the past ten or twelve years a greater amount of silver has heen produced than ever before in the same time, need not alarm political economists that more is heing produced than is wanted for the world's requirements. Great Britain and the Australian colonies have lately gone through a financial crisis of a severe kind, while most other countries are in a chronic state of impecuuiosity, and all for the want of more money.

The gold hlanket is not big euough to cover the financial nakeduess of all nations, therefore it is essential that silver should hear its fair share in finance with gold, and I am satisfied, after much consideration, that a ten-per-cent ratio with gold would he a henefit and convenience to all classes hy raisiug the value and uses of silver without depreciating the gold standard. Silver notes of 20s and 10s might also be issued agaiust the reserves of silver hy hanks.

Although gold and silver have heen produced in such apparently large quantities since 1849, the rapid increase of population, the gigantic extension of finance, trade, commerce and industries, and the requirements of the money-using people, have increased faster than the output of gold and silver.

The following totals show the world's production of gold aud silver from 1849 to 1889, as given hy differeut authorities:

Gold (in dollars)	$4,431,000,000	£886,200,000
Silver "	1,877,000,000	375,400,000
Totals	$6,308,000,000	£1,261,600,000

Thus, taking the production of gold aud silver during forty years of the most prolific yields the world has ever experieuced, aud the totals only amount to £1,261,600,000; now, deducting the odd £261,600,000, or about one-fifth, as heing ahout the quantity used in arts and industries, loss or wasted, would leave 1000 millions sterling in gold and silver for currency for the world's use, and taking a money-using populatiou of 1000 millions of people in the world, they would have had for division among them the magnificent sum of £1 per head in forty years, or, say, 6d per head annually of new money.

During twelve years from 1880 to 1891 the production of silver overtook and exceeded the supply of gold, the totals heing—gold, £258,865,391, and silver (at a dollar per ouuce) would amount to £311,571,819, or, say, a total of gold and silver bulliou value of £570,437,210, deducting one-fifth for use in industries, say, £114,087,442, would leave for coinage or currency, say, ahout £456,348,768, or less than 10s per head of the 1000 millions of money-using people who are all wanting more money than they have got at present, or less than 1s per head annually of the population of the world who use money.

With there facts hefore us, it is scarcely advisahle for any of the foolish alarmists to create a scare ahout an overproduction of silver or gold. There is not enough heing produced for present requirements, or to keep pace with the increasing population throughout the world who all want more money. Some alarmists are eonstantly holding up the Uuited States of America as a shockiug example of a country that has too much money, and, therefore, too prosperous, hut examine facts and see whether America is producing more gold and silver money than the rapidly increasing population and their wants require.

Take the production for 1892 in gold at ahout £6,600,000, and silver ahout £11,600,000, or a total of the precious metals at £18,200,000 sterling; deduct for use in arts and industries, say, £3,200,000, would leave for coinage or new money ahout £15,000,000 to he distributed among a populatiou of, say, prohahly over 70,000,000 people, or the insignificant sum of ahout $1 per head (in gold and silver) of the population of the United States of America.

Surely there is nothing alarming to frighten the timid political economists of the day, who profess to dread a superahundant supply of gold and silver for money in that country. It will take a long time to ruiu that great country hy producing aunually from the gold aud silver mines only one new dollar per head of its population.

The trade commerce and industries of this and other countries are uot languishing in cousequence of an overproduction, hut in consequence of not enough of gold or silver heing raised for distrihutiou in the shape of new coin currency, and if people would but hring a little more common sense intelligence to hear upou the relative values gold and silver should hear to each other, the great hughear of overproduction of silver would soon disappear.

Gold and silver, which everyhody wants more of, cau ouly be produced hy miniug, which means hard work, consequently there is no fear of an overproduction, and, therefore, mining for the precious metals is not only the most important industry of the day, hut where properly conducted is also the most profitahle, and is deserving of more attention heing given to its development.

WATER at high temperature cannot be raised any considerahle distance by suction, as the vapor discharged from the watcr so heated follows the receding pistous of the pump and resists the entrance of the water; consequently, to pump hot water always place the supply ahove the pump, so that it will he up plied from a head.

The Color of Gold.

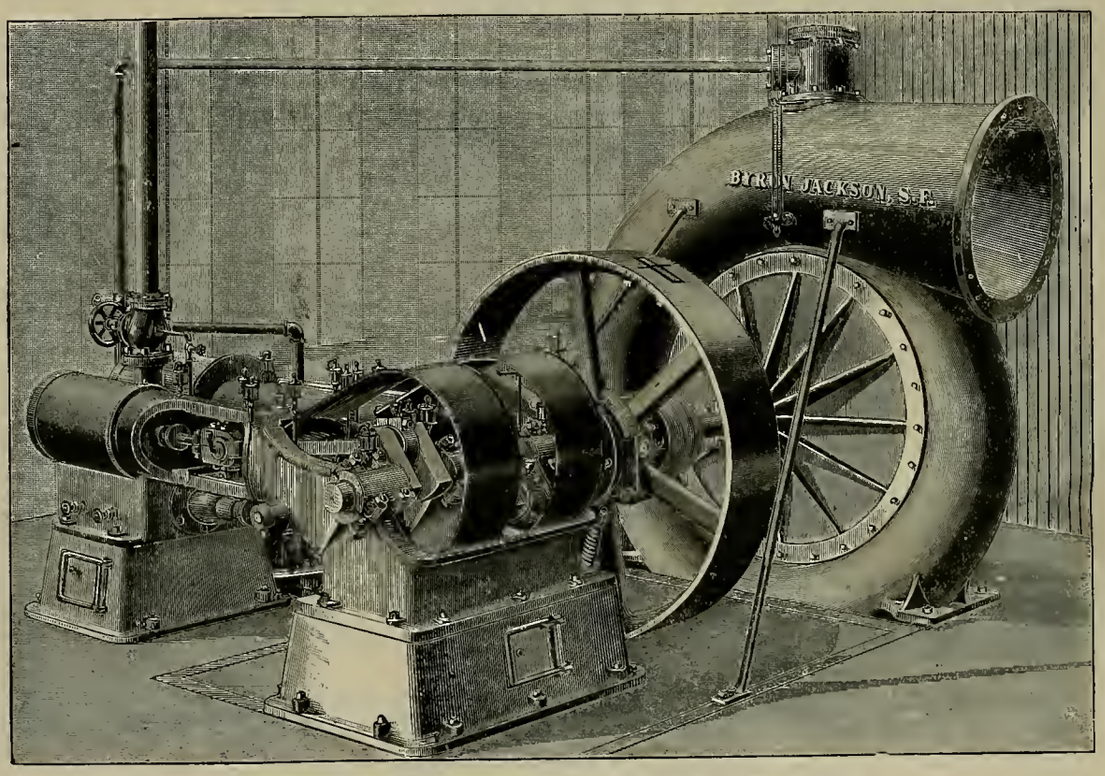
"Most people suppose," says an assayer in *Ores and Metals*, "that all gold is alike when refined, but that is not the case. An experienced man can tell at a glance from what part of the glohe a gold piecc comes, and in some cases from what part of a partieular gold district the metal was ohtained.

"The Australian gold, for instauce, is distinctly redder than the Californiau, and this difference in color is always perceptihle eveu wheu the gold is 1000 fine.

"Again, the gold ohtained from the placers is yellower than that which is taken directly from quartz. Why this should be the case is one of the mysteries of metallurgy, for the placer gold comes from the veins. The Ural gold is the reddest found anywhere.

"Few people know the real color of gold, as it is seldom seen unless heavily alloyed, which renders it redder than when pure.

"The purest coins ever made were the fifty-dollar pieces that used to he commou in California. Thcir coinage was ahandoned for two reasons—first, hecause the loss hy ahrasion was so great, and second, hecause the interior could he hored out and lead su hstituted, the difference iu weight being too small to he readily noticed in so large a piéce. Thcse octag onal coius were the most valuable ever struck."



JACKSON'S PATENT SINGLE-VALVE CROSS-COMPOUND ENGINE.

Single-Valve, Cross-Compound Engine.

The engraving on this page illustrates Jackson's patent single-valve, cross-compound engine, 100 H. P., direct connected to a 30-inch Jackson centrifugal pump, with a capacity of 20,000 gallons per minute. The pump and engine have heen found efficient and satisfactory in the work of reclaiming land along the Sacramento river and elsewhere.

ANATOMISTS, when they wish to separate the hones of a skull, sometimes resort to very peculiar procedure. They fill the skull with small heans and place it in a vessel of water. The heans swell and rend the skull apart. The well-known Germau physiologist, Grehaut, measured the force which the heans are capahle of exerting under these conditions and found that it indicated five atmospheres, equal to the average pressure in the boiler of a steam engine.

THE Indiaus of Guiana have a queer system of numeration. They count by the hand and its four fingers. Thus, wheu they reach five, instead of saying so they call it a "hand." Six is, therefore, a "hand and first finger;" seven, a "hand and second finger." Ten is "two hands;" hut twenty, instead of heing "four hands," is a "man." Forty is "two men," and thus they go ou by twenties. Forty-six is expressed as "two men, a hand and first finger."

IN 1835 the rate of wages in Europe was very low. Day lahorers in Italy received 8 cents per day, in Russia 12 cents, in Holland 18 cents, in France 30 cents, in England 40 cents, in the United States 80 cents.

The Mariposa Farmer.

An experienced miner and prospector, writing to a friend in Los Angeles from Mariposa county, gives a romantic idea of a type of the honest farmer whom we sometimes read about. He says that all the land in the region which he is in is mineral land; that it has all been taken up from the Government as agricultural land and so patented; that he made a verbal agreement with one of these farmers to be allowed to prospect the latter's domain, and if he found anything the farmer said he "could make his own terms." The miner spent weary weeks in tramping all over that big area of wild mineral land called farm, and tested many places; finally he found a lead he thought was valuable, made numerous probings on it, and concluded to "stick his peg there;" he went to the farmer to make a little agreement on the lines laid down, and was informed by the horny-handed that the latter's boys had located the lead, and that no agreement on that head was possible. The miner afterward learned that these boys of the farmer had been doggiug his footsteps all over the "farm" and locating every spot they saw him doing any work on.

The miuer further stated that the feeling between so-called farmers and miners in that country is at high pressure. The "farmers" have grabbed the land, patented it as agricultural land, while the miners insist it is mineral and claim the right to prospect on it. A few nights ago there was a "scrap" among miners and farmers, whereby oue man was killed and another wounded. There is likely to be a deluge of law suits there shortly to "bust" up a thousand or so of those frauduleutly obtained patents.

The miner draws a most depressing picture of the landed conditions in the central part of the State. With a pack animal he prospected for 300 miles between Caliente, Kern county, and the Mariposa line. All the land is taken up in immense tracts, the grauts extending far up into the mountains. These are mostly fenced in and guarded by a few farmers under the guise of cattle-herders. If you climb a fence you have some one riding up to you and demauding in broken English that you get out. The water, as well as the land, is gobbled up, and he had the utmost difficulty in getting access to enough water to quench the thirst of his burro, although streams were running at short intervals apart. He met few people on his trip, and by the few he did meet he did not hear a clear English word spoken. The land is mostly all held by men living in San Francisco and New York.

New Mexico Turquoise.

"It would be a lucky thing these panicky times if a man, while walking along in a reverie, could stump his toe against a pebble worth $4,000, and he knew the value of the stone," said James G. Wicks of New Mexico to a New York *Press* reporter, "but that is just the luck that happened to a man down in my Territory. He was prospecting for gold, and while walking along a ledge in the mountains his toe struck a little blue pebble, and he picked up the stone to look at it, when he discovered, on close examination, that it was a turquoise of rare beauty and value. It was sent to Tiffany of New York, where it was cut and polished, and it turned out to be one of the finest ever seen in America. It is worth $4,000. It is of an exquisite blue, the color of the sky on a cloudless summer day. But these discoveries are rare. Men who find pebbles worth $4,000 apiece lying around anywhere are not bruiting the fact over the country; therefore many rich finds are kept secret.

"There is no doubt in my mind that there were old turquoise mines worked by the Aztecs in New Mexico, and the Indians worked the mines later. Indian graves have been opened there in which were found a few polished turquosie beads. Eastern capitalists leased a turquoise mine a few miles from Los Cerrillos, N. M., four years ago, and several thousand stones have been produced. This $4,000 turquoise I spoke of was about the size of a blue bird's egg, but thousands of stones of the same size are found that are only of small value. Those found near Los Cerrillos are a beautiful sky-blue, but those in some other portions of the Territory are of a green color, or more of the tinge of a robin's egg. In earlier times, before white men entered the continent, the aborigines certainly worked the turquoise deposits extensively, but it is only in recent years that any commercial value has been given them."

Peculiar Engraving.

One of the experiments made by those whose business it is to test the strength of dynamite, gun cotton aud other explosives is to place fresh-plucked leaves between two sheets of panel steel and explode cartridges on the upper plate. The recoil in such cases is so great and sudden that the upper plate is driven downward with such force and rapidity as to catch exact impressions of the leaves before their delicate ribs have time to give way to the force of the blow. This novel method of engraving is one of the wonders of the country.

A Simple, Low-Priced Time Recorder.

The New National Time Recorder Company, of Milwaukee, Wis., have put on the market, in addition to the Bolte automatic and autographic recorders, their latest style recorder, which the firm has called the American. Fig. 1 shows the complete recorder,

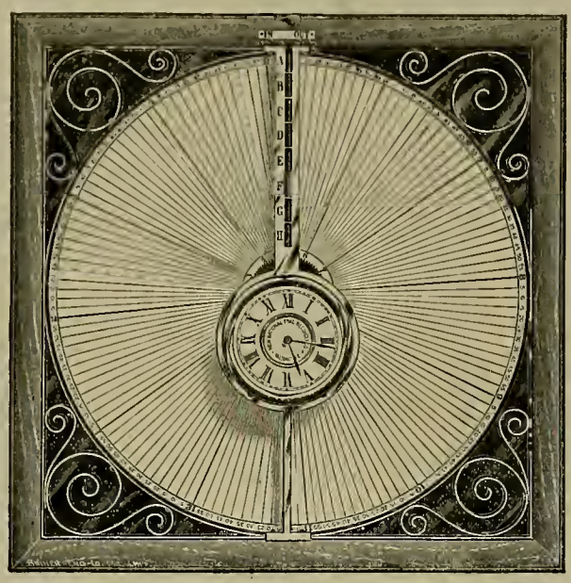


Fig. 1.—AMERICAN TIME RECORDER.

which will take a twenty-one-inch record dial. Fig. 2 shows a portion of the record dial after a day's registration has been made. The heavy lines are hour lines and the lighter ones five-minute lines. Thus it may be seen at a glance any time during the

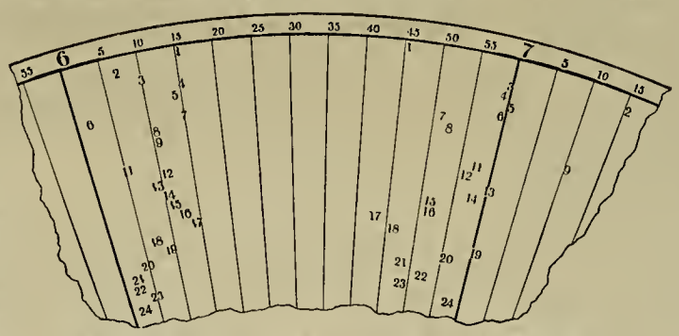

Fig. 2.—RECORD DIAL OF AMERICAN TIME RECORDER.

day, by the employer or by any one interested, that No. 2 is fifteen minutes late, No. 9 ten minutes late, and No. 10 is absent, not being registered. By a novel arrangement the numbers come consecutively on the record dial, and the key, or check (Fig. 3),

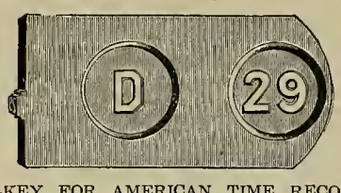

Fig. 3.—KEY FOR AMERICAN TIME RECORDER.

will enter only the hole for which it is intended. A slight pressure on the key will ring the bell and indicate that a registration has been made. The arrival of the employes is indicated by the numbers appearing in red and the departure in blue. This is accomplished by moving a small lever above the key holes, at the front of the clock, either to "in" or "out." This lever shifts the record ribbon through which the registrations are made. The recorder referred to above will register 100 employes; however, by using a number of recorders, which is generally preferable in large establishments, as many as 1000 can register, the numbers coming consecutively.

THE London *Electrical Review* believes that there are reasons for believing that the ether obeys the ordinary laws of gravitation. "If we accept the notion that ether attracts itself, and obeys the ordinary laws of gravitation in regard to itself aud to other forms of matter in a condensed form, then it is not difficult to understand its whole phenomena of disturbance."

Nitrate Beds in Colombia.

Immeuse nitrate of soda deposits have been discovered recently in the United States of Colombia, South America. As these beds are situated on or near navigable rivers, which run into the Caribbean sea, they are thus over 2500 miles nearer the markets of the United States and of Europe than the Chile fields of niter.

The new nitrate beds are about thirty square miles in extent, and are from one to ten feet in thickness. They lie at Val du Tar, south of the spurs of the Sierra Nevada de Santa Marta, a distance of sixty-five miles from the city of San Juan de la Cienaga, and are in part on the waters of the San Sebastian river, which flows into the great sea level lake of Cienaga Grande, which is the extreme northern portion of the Republic. These nitrate fields can be placed upon a direct line of inland navigation by connecting the waters of the Aracataca river with those of the San Sebastian, at a cost not exceeding $5000. When the Santa Marta seaport railway is finished, it will run to the village of Fundacion, and within half a mile of the nitrate beds.

The Heat of the Sun.

Speaking of the heat of the sun, Professor Newcomb says: "If we call the chromosphere an ocean of fire, we must remember that it is an ocean hotter than the fiercest furnace, and as deep as the Atlantic is broad. If we call its movements hurricanes, we must remember that our hurricanes blow only about 100 miles an hour, while those of the chromosphere blow as far in a single second. They are such hurricanes as, coming down upon us from the north, would in thirty seconds after they had crossed the St. Lawrence, be in the Gulf of Mexico, carrying with them the whole surface of the continent in a mass, not simply of ruin, but of glowing vapor, in which the vapors arising from the dissolutiou of the materials composing the cities of Boston, New York and Chicago would be mixed in a single indistinguishable cloud. When we speak of eruptions we call to mind Vesuvius burying the surrounding cities in lava, but the solar eruptions, thrown 50,000 miles high, would eugulf the earth and dissolve every organized being on its surface in a moment."

Making Sunlight.

Nicola Tesla, whose wonderful achievements in the line of electricity, are well known, thinks that he will soou be able to produce sunlight on the earth at will. He says that the light of the sun is the result of electrical vibrations in the 94,000,000 miles of ether which separate us from that great lumiuary, and does not proceed from a great central fire, as the scientists have all along held. If these vibrations can be reproduced the light will follow. The rapidity of the vibrations in a second necessary to produce the desired result is, he says, expressed by the figure 5 with fourteen ciphers annexed, and he is now trying to build a machine which will produce these vibrations. It would appear from what he says that this vibration must be produced in nothing, or what comes next to nothing—ether—for he asserts that if one had a solid chunk of steel as big as a house, and could communicate to it this vibration, it would instantly be atomized and disappear.

The Largest Map in the World.

The giant of the map family is now in course of preparation and construction at Washington, D. C. It was begun over twelve years ago under the supervision of the United States Geological Survey Corps, and it will not be more than half completed at the end of the present century. Some idea of the gigantic plans upon which this map is being constructed and of the magnitude of such an undertaking may be formed by considering the fact that the portion which delineates the little State of Connecticut and the northern tip of Long Island is six feet in length and nearly five feet wide. When this wonderful map is finished, it will indicate the exact location of every brook, creek, river, hillock, mountain, valley, farm, village, school house and city in the land, and will show every public and private road and highway as perfectly as the surveyor's map gives them in the townships. When completed, this map will cover almost an acre in superficial area. This beiug the case, it cannot be either hung up or spread out, and in order to make the information it contaius available, it will be issued on the sectional plan.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER XIII.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894 by Henry G. Hanks, F. G. S.

The pipes from gas wells sometimes become clogged with salt, which crystallizes on the inner surface. To clear this, the pressure is increased by skillful manipulation, by closing in succession the pipes of the regulator until at the proper moment they are thrown open suddenly, and the rush of gas clears the pipe very much as an animal clears the bronchial tubes by coughing. This gas is ignited at the regulator; a sudden burst of flame announces the clearing of the pipe.

Numerous devices for reducing the pressure have been invented to meet the requirements for domestic use. In dwellings it should not exceed four ounces to the square inch.

As the gas flows in the pipe line, the pressure is somewhat diminished by friction and expansion. Considerable force is required to cause the gas to flow the distance required. When it is desired to still more diminish this, the pipe is enlarged or divided. It is also reduced by valves. The flow is so regulated that when the gas has reached the end of the pipe line it has been reduced to thirty pounds to the square inch.

When flowing in the street distributing pipes, the pressure is from seven to ten pounds. It is by similar management still further reduced, so that it is delivered to dwellings at from two to four ounces, and to manufacturers at from ten to twenty ounces. The superintendent regulates the pressure from his office, which communicates with all points by telephone.

The principal gas well at Murraysville yields thirty million cubic feet of gas in twenty-four hours, but the portion used is very inconsiderable. At Findley, Ohio, one well is estimated to produce forty million feet daily. This would fill a cubic space with sides 342 feet square. This will demonstrate the utter impossibility of storing the gas.

After so many years of use and waste, during which manufacturing in the gas regions was revolutionized, as might be expected, the supply began to diminish. This was first noticed in 1877. In 1888 it was an admitted fact. The best authorities expressed the opinion that it is only a question of time, and that, while the cessation of flow will not be sudden, there is a limit to the production, and that it will eventually cease wholly. The following quotations from newspapers express the opinions of those best informed.

1891.—E. T. Jordan, natural-gas inspector for Indiana, has just returned from Findlay, Ohio, and other gas fields of northern Ohio, and reports a heavy loss of both pressure and volume of gas in all wells there. He predicts that in two years there will be no gas in northern Ohio for manufacturing. He also speaks discouragingly of the prospects in the Indiana field.

Mr. Jordan gives no scientific reason for his belief in the failure of the gas supply, but states the fact that the pressure is weakening.

1891.—SPRINGFIELD (O.), July 9.—There is a scare in the large manufacturing centers in central Ohio, which is so in the case of Springfield, Dayton and many of the smaller towns which are supplied with natural gas from the Mercer county fields. The largest company in the field has drilled in eighty-six wells at a cost of $135,000. Twenty of the wells have been exhausted and fifteen more will be abandoned within sixty days, leaving fifty-one wells on the line, and some of these not very strong. Several of the wells were tested, and it was found that the rock pressure was 240 to 275 pounds to the square inch.

When the field was first opened the pressure was from 275 to 380 pounds. An expert concludes that this pressure is too weak to force the gas as long a distance as at present, and thinks the natural-gas supply for central Ohio will soon be exhausted. Vast interests are involved.

1891.—PITTSBURG, August 3.—The Ford City Plate Glass Works, which are the largest in the United States, will return to the use of coal as fuel. The company expended a large sum of money in drilling gas wells in the vicinity of the works and thoroughly tested the question of fuel supply. Natural gas has proved to be a very uncertain thing, but the company knows that the hills about their works contain a practically inexhaustible supply of coal. This action is another proof that manufacturers are getting somewhat out o patience with the fickleness of natural gas.

1892.—The days of natural gas are numbered. There is surprising unanimity among the mining engineers on this point. They agree that more gas can be found, and that wells may continue to flow to some extent, but they say experience has proven that the supply cannot be depended on for manufacturing or for heating purposes. The amount of natural gas reached its maximum two years ago. It has fallen off each year since, notwithstanding the large number of new wells bored. Said a Pittsburg engineer:

"We have had a pretty bad time this winter in Pittsburg. The flow has given out repeatedly just at a time, perhaps, when most needed. People who had no coal in their houses have had the gas go out on them in some of the very coldest weather.

"Manufacturers who depended on gas for fuel have had to shut down. Business has been deranged, and home life has been made miserable. Some people are still boring wells and endeavoring to keep up a supply by tapping places, but with only partial success. One after another the wells give out. When they cease flowing the only thing to be done is to turn the valve and leave them alone. Sometimes a well will start up again and flow gas after it has been idle for some time. But all seem to reach a state of exhaustion sooner or later. Manufacturers are going back to coal again, and householders are agreeing that it will not do to depend upon natural gas. One thing has been made certain, the theory that the manufacture of gas is going on fast enough to supply the flow is all wrong. It is a slow process. We have already bored holes enough to overtask nature."

At Toledo, Ohio, the introduction of gas stimulated manufactures, but it is now used more economically, indicating that the supply is believed to be limited.

The supply at Bradford is gradually failing, both in quantity and pressure.

I find it stated in a paper published in 1891 that "more than four-fifths of the immense plants located in Wheeling, West Virginia, and surrounding cities have been compelled to abandon the use of gas and return to that of coal, the gas fields which supplied them being exhausted. Nearly three million dollars capital invested is practically lost."

It is thought that the decrease is due to the clogging of the well pipes and natural channels in the oil and gas bearing sands.

(To be continued.)

The Inventor of the Circular Saw.

In a lonely, secluded spot in the northwest corner of the cemetery, near the ever-beautiful little village of Richmond, Kalamazoo county, Mich., the reader can find, on a pure white marble slab nearly concealed from view by a large cluster of lilac bushes, engraved the simple inscription: "Benjamin Cummings, born 1772, died A. D. 1843." And who was Benjamin Cummings? He was the inventor of the circular saws now in use in this country and in Europe. Nearly sixty years ago, at Burtonville, New York and Amsterdam, this man hammered out at his own blacksmith's anvil, the first circular saw known to mankind. He was a noted pioneer in Richmond; a first cousin to one of the Presidents of the United States; a slave owner in New York State; a leading Mason in the days of Morgan, at whose table the very elect of the great State of New York feasted and drank freely of his choice liquors and wines; a vessel owner on the North River before the days of steamboats; a captain in the war of 1812, where, after having three horses shot from under him, with one stroke of his sword he brought his superior officer to the ground for insult, and because he was a traitor and a coward; and, after having been court-martialed, instead of being shot he was appointed colonel in his place. In this lonely grave are the ashes of the man who, nearly seventy years ago at Albany, New York, took up and moved bodily large brick buildings, and, to the wonder and astonishment of the world, constructed a mile and a half of the Erie canal through a bed of rock, and who also built, on contract, those first low bridges over the same. He also aided in the construction of the first ten miles of railroad built in the United States, and founded both the villages of Esperence and Bostonville, on the old Schoharie, near Amsterdam. The study and aim of this man's life appeared to be to do that which none other could accomplish, and, when the object sought was secured, he passed it as quietly by as he would the pebbles on the sea shore.

Work and Wages in China.

E. T. Simcox in his "Primitive Civilization" says that the two occupations in China are learning and agriculture. The standard of comfort for the laboring masses is fixed by that of the smallest cultivators, who form the largest section of the population. Poverty never involves actual starvation, except in times of famine. It means having to eat plain rice. The average man in China probably gets enough to eat, such as it is, in ordinary times. The farms are small, from half an acre to four and one-half acres. The estimate is that one acre will support twelve persons in abundance. Wages are very low. A recent Chinese writer states that the average earnings of workmen are twenty cents a day, and that half of this is enough to support a family of five, after Chinese fashion. The new Penal Code fixes the value of labor impressed into the public service at fourteen cents a day. But these are minimum rates. In cities carpenters and masons get thirty cents a day without food; servants $6 a month without food; farm hands $17.50 a year without food; clerks and accountants $10 to $30 a month without food. A soldier's pay is $5 a month without board, but half of this is paid in rice.

THE work of resurveying the boundary line between the United States and Mexico which has been going on for two and half years is about finished. Eighty men were employed under Col. J. W. Barlow. A distance of seven hundred miles—from El Paso, Texas, to San Diego, Cal., was surveyed. The changes were unimportant: the correct line is now marked, throughout, by permanent monuments.

PROFESSOR MENDENHALL'S RESIGNATION as Superintendent of the Coast and Geodetic Survey has been in President Cleveland's hands for the last sixty days, action upon it having been delayed to give Secretary Carlisle an opportunity to select a new superintendent.

TWO MEN at work on the iron ship at the Norfolk navy yard were killed by electricity recently, though there was no visible lightning flash. The ship acted as a condenser and conductor and poured the current through the men, who were standing in water.

Mines of Eastern Nevada.

The town of Ely is at the base and on the east side of the Egan range at the mouth of Robinson canyon near the head of Murray creek, a stream of clear, cold water of some 800 or 900 inches, which, besides furnishing pure water for the town through which it passes, and for the irrigation of several ranches below it, is further utilized to propel a quartz mill in the southwest part of Ely.

Nearly all the gold mines of the district, says a letter to a State exchange, are situated in Robinson canyon, about one mile west of Ely. The Chinaman mine is one of the largest and most important mines in the district. Negotiations are now pending for the sale of this property to Eastern capitalists for $150,000.

Adjoining on the north of this mine is the Joanna, with outcroppings indicating a vein 100 feet or more wide. These two mines present to the eye massive bodies of gold ore giving assays from $12 to $30 per ton, but the major portion of the gold is held impounded in iron to such a degree as to require the most careful and scientific treatment through the best and latest improved machinery and appliances to save from fifty to sixty per cent of the gold. All the gold mines of this district contain in a more or less degree the same constituents, and will require about the same treatment to relieve the gold from its impounded condition.

These two mines may be said to be literally a mountain of ore. It is a random estimate to name the amount of ore in sight, yet I will venture to say that there seems to be not less than 20,000 or 25,000 tons.

The Los Angeles mine is situated about one-fourth of a mile to the west from the Chinaman; has a shaft upon it to the depth of 75 feet, which opens out to view a large vein of fine ore which seems to be less rebellious than the Chinaman or Joanna.

The Robust is a fine prospect on the north side of the canyon, upon which a shaft has been sunk to the depth of sixty-two feet, exposing to view the entire depth a six-foot vein of gold ore assaying about $12 per ton.

The mineral formation of this district is principally lime with an occasional zone of quartzite and porphyry, also some little slate here and there. These gold deposits that surround Ely are favorably situated, and the necessary facilities for working the same are in superabundance in the shape of wood for fuel and timbering purposes, also a plenty of water. All that is necessary in addition to the above is capital to further open out these mines, aided by the hand of science. With these important factors a bright future would be assured to this district and the sprightly town of Ely, making her the business center of White Pine county.

WARD DISTRICT.—Some eighteen or twenty miles farther south on the east side of Egan range is situated Ward Mining District, noted for its large output of silver bullion from 1880 to 1888, aggregating during that period several millions of dollars. At the close of the year of 1888 the rich vein of the Martin White Company was lost by a break of the ledge or a slide of the vein in place. From that period to a few years ago a large amount of well-directed prospecting was inaugurated to re-find this rich deposit by sinking deep shafts and running tunnels, one of which was 1500 feet deep, into the bosom of the mountain. With bright prospects of encountering a body of ore in one of the tunnels, the work was closed in consequence of the heavy drop in silver.

TAYLOR MINING DISTRICT.—Directly across the Steptoe valley on the west side of Shell Creek range, ten miles from Ward, is Taylor Mining District. The population of Taylor to-day consists of one family, while three years ago it was not less than 2000 persons, and the mines and mills gave employment to over 300 men and heavy shipments of bullion were made weekly. Hotels and business houses have been left by the owners, some with their furniture still in them. Before the closing of these mines and mills a good cash market was afforded for the produce of the farms and gardens of Steptoe and Spring valleys. There is to-day some 8000 or 9000 tons of second-class ore averaging from $25 to $35 per ton, besides a large quantity of first-class ore on the dumps of the Monitor and Argus system of mines that could not be milled with profit at the present prevailing low price of silver. The two large quartz mills, which are well equipped with everything necessary, together with the hoisting works, have doubtless cost over $500,000 and are now fast disappearing. At the time of suspension of work in the Argus mine there was then in sight several hundred tons of first-class ore ready to be knocked down and worked as soon as silver shall again reach 90 cents per ounce. With a reasonable prospect that it will not drop below 80 cents per ounce, mining at this place will revive and be continued.

EVEN the likelihood of a dividend in Con. Cal. and Va. does not make buoyant the mining stock market. It has long been noted that an assessment is as likely to make a stock advance, as a dividend is to depress it, and the present state of affairs on the street is but a continuance of an existing anomaly.

A Far-Off Northern Mine.

Unique among the thousands of mining claims on this coast is the property of Mr. J. C. Greene, being the Omalik mine on Fish river in the extreme northwestern part of Alaska. The best location that can be made of the mine, which is probably the farthest north and west of any in the world, is to say that it is in Lat. 65° N., and Lon. 164° W. Juneau and Sitka seem out of the way places, but the Omalik mine is nearly as far from Sitka as Sitka is from San Francisco.

It was in '81 that Mr. Greene first acquired possession of the mine, and since then he has spent about $100,000 in developing the property, putting together buildings, steamboats, etc. He has a mine as unique as its location, being "solid metal." The ore is galena, 75 per cent of lead, carrying 143 ounces of silver to the ton and a very little gold. There is a five-foot ledge between walls of limestone and slate. Mr. Greene makes an annual visit to San Francisco, bringing the output of the mine for the year just as it was taken out of the drift, seeuring, this last trip, $140 a ton for the ore. He hires all his men in San Francisco, they agreeing to work for $75 a month and board. The mine is unique also in haviug no pay days. The men never see a cent of wages from the day they leave San Francisco till they return again with treasure in the hold under their feet from twelve to sixteeu months after. When the eargo is sold, then they are paid off, getting from $900 to $1200 apiece. As there are uo stores there is little need for money, and the mode of payment beiug fully explained to them, they have no difficulty in saving every cent coming to them and getting it "all in a lump." Supplies of all kinds are bought in San Francisco, and when the meu start for the mine enough is taken of provisions, clothing, ammunition, etc., to last a year.

Mr. Greene says it isn't louesome, "if one has enough to do to keep his mind and body occupied," and is enthusiastic in describing the magnificent forests, the waters teeming with fish, the long, cool summer days and the splendors of the aurora in the land of the midnight sun. He says where his mine is is far north of the rain belt, aud the climate in the summer is glorious, while the winter is not so cold as farther south. He thinks Alaska is the coming country, and says very few have any idea of the marvelous wealth and extent of its natural resources.

In Colorado.

Thad. Bellinger, writing to John Murphy of Wood River, Idaho, from Cripple Creek, August 25th, says:

"There are about twenty of us Wood River men here, and only three at work. It is impossible to get anything to do here unless you have the whole camp pulling for you, or you belong to the A. P. A. I cannot get a thing to do, and I've worn myself out looking for work."

Referriug to a well-known former Wood Riverite at Cripple Creek, he says:

"He is superintendent of the ——— Tunnel Company and is runniug a blind tunnel into a mountain, looking after something—all the same as the Bellevue tunnel below Broadford.

"He tries to make the impression that he has made lots of stuff. I hope he has. One thing, he has lots of company, as there are more d——d liars to the square inch in Colorado than in the balance of America."

Boiler Explosions and Their Causes.

The annual report of the chief engineer to the Engiue, Boiler and Employers' Liability Insurance Company, Manchester, England, just issued, affords an insight into the causes of engiue breakdowns and boiler explosions which cannot fail to be instructive to those who either manufacture or use steam-generating apparatus. It appears that 33% of the accidents to engines in respect of which the company paid compensation during the year were due to weakness, faulty design or bad workmanship; 27% were due to causes purely accidental or unascertained; and only 12% to the negligence of owners or attendants. The last-named percentage is considered very satisfactory, as it shows a considerable reduction on the previous year. As usual, the greater number of the accidents arose from the failure of spur gearing, and from defects in the valves and valve-gear. A large percentage of the breakdowns, however, were due to defective columns, entabletures, bed-plates and pedestals, and to the failure of screws, bolts, cotters and straps. There was a dimiuution in the number of accidents arising from the failure of the air-pump apparatus. The percentage of thorough examinations of boilers was 94, as compared with 98 in 1892. In addition to these examinations, 311 interual examinations, 407 cold-water tests and 36,255 ordinary inspections were made. These led, as might be expected, to the discovery of many defects of more or less importance. The more important may be classified as follows: Corrosion and grooving, 575; fractures and blisters, 146; safety valves dangerously overloaded or altogether inoperative, 100; water gauges out of order or inoperative, 173. Of the 994 boilers requiriug early repair, a number would undoubtedly have goue on working without repair till they exploded, or became standing examples of that perversity which appears at times to prevent boilers, as well as human beings, from doiug what they ought to do. Besides the cases mentioned above, uo less than 1020 minor defects were discovered, not dangerous, but still not to be entirely neglected. For instance, 179 safety valves were found overloaded, not dangerously, but yet overloaded.

A CORRESPONDENT of *Engineering* thus describes the means used for removing a shrunk-on crank disk from a shaft, the shaft being in place. He says: "I solved the problem by drilling a ¾-in. gas-tapping hole 8 inches up the end of the engine shaft, tapping the end of the hole, and inserting 3 feet of ¾-in. tube. Up this tube aud hole I passed a 5-ft. length of ¾-iu. tube, conuected at its outer end to a flexible water hose. A good fire under the crank disk and a plentiful stream of water up the hole in the shaft soou did all that was necessary, and the disk was removed without further trouble. The ¾-in. tube merely served to keep the water off the fire."

Best Use of Timber.

To obtain the greatest strength in timber beams, joists, rafters, etc., the *Architect* says the depth must greatly exceed the width—the greatest strength opposed to the greatest strain. A joist 6x3 will bear twice as much if put edgewise as it would if laid flat. If the weight to he supported be in proportion to the length, then, the width remaining the same, the square of the depth divided by the square of the length ought to be the same also; *i. e.*, the depth of a joist ought to be in direct proportion to the length, and for stiffness the width proportionate to the depth. Where the question is of a piece of timber supporting itself, the weight is as the length multiplied by the depth, and we must multiply this again by the length for a divisor. A rod of fir an inch square, or a plauk 10x1 laid flatwise, would keep quite straight with a bearing of five feet. A piece of timber ten inches square would swag very much with a bearing of fifty feet.

A Novel Time-Glass.

"During a trip which I took through the West Indies several years ago," said a traveler, "I saw a sight in one of the old villages which brought the old proverb, 'Necessity is the mother of invention,' forcibly to my mind. In the front of one of the houses, on a veranda, stood a sentry whose business it was to keep the time for the village by means of a primitive sand-glass. Two beer bottles were firmly tied together, mouth to mouth, and fixed iu a wooden frame made to stand in reversible positions. A quantity of black sand ran from one bottle iuto the other in just half au hour, aud when the upper bottle was empty the frame was reversed. Twelve short sticks marked with notches from oue to twelve were hung upon a string, and a hook was placed between the stick bearing the number of notches corresponding to the hour last struck and the one to be struck next. The sentry announced the time by striking the hours on a large gong."

THE following, head line and all, is clipped from the Johannesburg, S. A., *Standard and Diggers' News*, dated July 28, '94:

STARVING IN GOLDEN SOUTH AFRICA.

Is anything being done (asks the *Cape Times*) to provide shelter for the increasing number of the houseless in that city? Complaints have reached certain churches, of the cemeteries along the Green Point road—one of these cemeteries in particular—being again used by outcasts, who at night climb over the walls or creep under the old flat tombstones or on to the lee side of the upright stones, where they fall asleep. Some of these poor creatures turn up of a morning at the villas in Green Point—half starved and shivering—craving a bit of bread. The practice of sleeping in the cemetery, despite the outcry some years ago, is alleged to have become so common that some of the destitute are known to refer to certain tombstones and certain embowering trees as their own particular bed or sleeping places.

MINE BELL SIGNALS

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12 X 36 INCHES, THE MINE BELL SIGNALS AND RULES PROVIDED FOR IN the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market Street, San Francisco, Cal.

Scientific Progress.

Is It a New Gas?

Sometbing of a sensation has been created in scientific circles by the statement that a new gas, a hitherto unknown constituent of air, has been discovered by Professor Ramsay. It is said to constitute about one per cent of tbe atmosphere, to have a density about fifty per ceut greater than nitrogen, and to be rather inert and characterless. Only a quarter of a pint of tbe fluid has been isolated as yet. Professor Dewar, the chemist who succeeded in freezing air nearly two years ago, aud some other experts are skeptical on the subject. It is thougbt possible that tbe gas, instead of being an entirely new element, is simply nitrogen in another guise. Many elements and compounds known to chemistry appear in various forms; and it is suggested that we may have here ouly another instance of allotropism.

While it is too soon, of course, to accept as established this supposed discovery of a new element, the story is interesting. Even if the facts prove to be somewhat different from what Professor Ramsay believes, it must still be reckoned an advance in science when we learn to distinguish either a new substance or a new form of an old one.

The annonncement recalls a curious chapter of chemical history. Early philosophers regarded common air as an element, not a compound; and it is only a trifle over a century since the mistake was recognized. Prior to 1772 it was known that in some mysterious way breathing converted air into a suffocating substance called "fixed air," a term then used to designate carbonic acid, also obtaiued by fermentation. In the year just mentioned, however, Rutherford stated that he had found the gas expelled from tbe lungs to be separable into "fixed air" and something else; and he has therefore been credited with the discovery of nitrogen or azote, whicb forms about four-fifths of the volume of ordinary air. But it is to the discovery of another element of air that the chief interest attaches. And tbe share which Joseph Priestly had in that achievement illustrates in a striking manner how even a thoroughly scientific man will sometimes be so hampered by theory as to reject fact.

Early in the last centnry Stahl's notions as to the existence of a substance wbich, incorporated with another, rendered the latter combustible, obtained wide acceptance. Priestly became fully imbued with tbis error. He would calcine lead and mercury, and when they had turned to powder be would say, "Behold, we have burned the pblogiston out of the metal; but if we take the calx, or residue, combine it witb powdered charcoal, and heat them again, phlogiston is restored to tbe lead, or mercury, and the latter reappears in its natural or metallic form." The modern chemist knows that in the first of tbese operations there was an addition to, uot a subtraction from, the subject of tbe experiment. Instead of phlogiston being removed by combustion, oxygeu from the air entered into combination with the metal. In tbe second experiment thc oxide was reduced. Tbe oxygen abaudoned the metal and succumbed to the superior attractions of the carbon in the charcoal. Consequently the tangible product lost in weight, instead of gaiuing. Priestley's scales told him so. But instead of grasping thc true significance of that fact, he fumbled around for explanations of his failure to get the evidence he expected. Later he put what we now know as hydrogen, but which Cavendish called "inflammable air," into a bell glass, suspended over water, and there combined the gas with oxide of lead by means of a lens; and he soon obtained pure metal. Meantime the volume of gas in the receiver was reduced. Today we know that some of the hydrogen combined with thc oxygen of the calx produces a few drops of water. Priestley, though, interpreted the result as indicating tbat "inflammable air" was composed in part, or entirely, of phlogiston, which was absorbed by the calx.

Finally, in a tube containing quicksilver, immersed in a dish coutaining the same metal, he subjected calcined mercury to the heat of a burning glass. A gas was evolved which produced an exhilarating effect wheu breathed, and it stimulated the flame of a candle immersed tberein. This was in 1774, two years after Scheele's independent achievemeut at Stockbolm. Priestley called his gas "dephlogisticated air." But Lavoisier, who followed up this experiment, promptly named the new element "oxygen," and showed how completely its character and the method of its production upset the old theory of phlogiston. It was theu quickly perceived that common air—not couuting the carbonic acid, ammonia and other impurities usually found therein—was composed mainly or entirely of this substance, and Rutherford's "azote" or nitrogen. Priestley's investigations extended over a long series of years; and it was he who discovered that tbe pungent liquid called ammonia owed its peculiar properties to a gas held in solution.

The Limit Not Yet Reached.

Discussion of wbether we have reacbed the boundaries of discovery in physical and mechanical science, and whether all tbat is left to future generations is to fill in the details and supplement what has already been done seems idle, if not arrogant, when it is remembered tbat the advancement of two generations cover all tbat we call modern scientific progress, and certainly include all that belongs to the practical applications of tbe two great modern agents—steam and electricity. And yet how very crude aud wasteful continue to be the methods of producing and applying both sources of power. For iustance, what a huge proportion of thc potential energy stored up in a ton of coal is wasted in passing through a furnace, and what an infinitesimally small percentage of the electric energy generated for the production of light is actually made available.

Why should the modern applications of steam for tbe production of motion be regarded as the final expression of human ingenuity in this direction? Is there not better reason to regard them as mere tentative efforts to draw on tbe storehouses of natural energy for the use of man? It is admitted that the furnace of a steam boiler is a lame and wasteful way of doing this, but it does not follow tbat progress is to be sougbt merely in tbe direction of a better designed furnace and further advance in boiler construction. Why should it be impossible to dispense with boiler, furnace and steam together, and, in the words of a recent scientific commentator, "by some simple and practical process reduce coal to a condition in which it will, wben brought into conjunction with the inexbaustible reservoir of oxygen in the atmosphere, give us the necessary elements for the production of an electric battery?" Or why, without drawing on tbe reservoir of solar energy stored in the bowels of the eartb, not utilize the daily stream of sun-light for direct conversion into some other form of force?

These can hardly be said to lie outside the ordinary limits of buman attainments. They are in tbe direct line of the progress of physical investigation wbich is rapidly reducing the number of what are called the laws of nature by revealing the identity of its processes. We are really only beginniug to interpret nature in a comprehensive way, and applied mechanics necessarily lags behind the advance of speculative physics. But it is not at all improbable tbat tbe centnry wbich has witnessed the subjugation of steam to the service of man, with all the marvelous phases of material progress that have attended it, may also see the steam engine rauk as a discarded invention. The process began with the interposition of tbe electric dynamo betwecn the steam engine and the machinery to be moved; it takes a tremendons stride in the demonstration that power running to waste in Niagara Falls can be converted into electricity, and reconverted, two or three bundred miles from tbe primary motor, into light, beat or motion. Tbe rapidity of recent advances to its solution may be held to be a measure of the time needed to eliminate from it all the elements of uncertainty. Every electrician recognized in Tesla's discovery of the rotary magnetic field the possibility of a revolution in electrical engineering, but it required some years of mecbanical progress to perfect tbe rotary field motor, witb its enormous gain in simplicity and compactness over its predecessors. But for this tbere would be no such excellent prospect as there is for the profitable transfer over a wide area of tbe 50,000-horse power received from the turbine wheels already installed, or about to be installed, above Niagara Falls.

The first step, appareutly, to the laying aside of steam as a primary source of power is to connect with the water wbeel, which steam displaced. Thus the age of steam may come to be reckoned a mere interlude, if uot somewbat of a hindrance, in the process of scientific and mechanical evolution. For when tbe power of a cataract can be successfully transmuted into a more subtle power, capable of economical transmission over great distances, why not the power developed in the rise and fall of tbe tides? That is stopping very far short of the utilization of snnlight, and is probably enough for one generation to accomplish. But in the experiments that go to the demonstration, first, of tbe scientific, and next, of the commercial possibility of such things, there is the promise of discoveries still more advanced.

Wanted!
A GOLD MINE

No properties but those which will bear strict investigation will be entertained. Parties having good gold prospects will kindly correspond with

Mechanical Progress.

Chemistry in the Foundry.

The iron foundrymen in their associations are now wrestling with the question whether or not chemistry is of any value in iron foundry work. The great majority hold that it is not, and that practical experience is the only thing that will insure good castiugs; but a few "advanced thinkers" are urging the claims of chemistry. The foundrymen are now going through the experience that the blast furnacemen went through about twenty years ago. About that time a few of them began to employ chemists, but the old timers held that the only proper way to test an iron ore or a fuel was to try it in the blast furnace. Inside of ten years every important iron works in the country had its chemist, and all the iron ore was bought on its chemical analysis. In the iron foundry, however, too much must not be expected of chemistry. It will not tell us yet what compositions of iron to use for different sizes, shapes and strengths of different castings, for the quality of a casting depends not ouly on the quality of the raw iron used to make it, but on the changes in quality that may take place in it in melting, pouring and cooling. But having once obtained castings of a desired quality, and having reached a uniform practice in molding, melting, pouring and cooling, then to insure duplication of the desired results it is necessary that the composition of the iron be the same, and this chemistry enables us to insure, giving also the further advantage that it enables us to substitute for one lot or brand of pig iron another of the same aualysis, or a cheaper mixture whose combined analysis is the same.—Cassier's Magazine for September.

American Tin Plate.

The tin plate industry is three years old in the United States. In Wales it has been pursued for centuries. When the industry was started on this side, Americans had to import British machines, British ideas and British workingmen. After three years, only a vestige of those importations remains.

The Welsh method of rolling black plate is to have two stands of rolls—one roughing, one finishing—to each mill. The most modern American practice is to have a single stand of rolls to a mill, with heavier housing, the advantages being a greatly increased product, a reduced breakage of the rolls and other parts of the mill and a somewhat better quality of the plates. The surface of the rolls is kept clean by polishing between the heats with a piece of emeried oak wood—an American device. The crude doubling shears, driven by an underground rod in the Welsh mills, difficult to repair and then requiring all the mills driven by the large engine to stop, have been succeeded by heavier shears, receiving their power from a small independent engine.

Recent practice abandons counection between hot and cold mills as in Wales, and interposes the process of pickling and annealing over the cold rolls and being rolled into the plates. Decided changes have been made in the squaring shears, the crude alligator affairs first used here giving away to vertical and more accurate shears. Improved home-made articles are being substituted for Welsh pickling machines. The claim is made that within a brief time not a Welsh machine will remain in this country.

A Device for Racetracks.

An electrically propelled couveyance, containing the essential features of the automatic cash-carrier in a shop and a trolley car, has been invented by R. E. Sherman, of Chicago, to enable judges at a racetrack to follow and watch the horses. Various schemes have been thought of for this purpose, but noue of them are satisfactory or have proved successful. Until this one is fairly tested its merits cannot be known positively; but the inventor will be allowed to erect and try his apparatus on the Hawthorne track in Chicago.

A chair wide enough to seat two persons is suspended from one overhead wire, while from another above it is derived an electric current. Under the seat is concealed a motor, the armature of which carries a wheel so belted to a second wheel as to drive a third one that supports the vehicle. There is a brake operated by the foot. Although the accounts at hand do not say so explicitly, it is probable that the current is returned over the wire used to carry the car.

MR. MAXIM has recently taken various scientific and mechanical experts out, one or two at a time, on his flying machine, to show how it works. It runs a distance of about 2000 feet on rails, and guards of timber prevent it from lifting more than a few inches from the track. A speed of thirty-seven miles an hour was developed during one of these recent tests. In another, the machine pulled loose from its guides, rose a short distance, and then fell to the earth. Other accidents have been reported, but they all teach lessons iu the art of managing the device, and nothing serious has resulted.

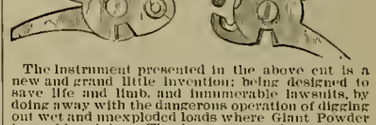
GIANT POWDER FUSE CAP FASTENER.



The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.
MOODEY & SHERWOOD Fresno, Cal.

BOOKS ON ASSAYING.
By C. H. AARON.

Part I.—GOLD AND SILVER ORES.
SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes wherof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price $1.00 postpaid. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from part I. and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

The Russell Process.

Send for free circulars of information. No. 220 Market St., San Francisco, Cal.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

THE GWIN MINE.—The Gwin mine in Gwin canyon is in process of development. The new hoist is giving satisfaction and sinking is being pushed rapidly with three shifts. The shaft is down 130 feet. It is the intention to sink 700 feet before crosscutting the ledge. The shaft is perpendicular and has three compartments, two being 4x5 each, and a ladder way 2x5 feet. The improvements upon the surface consist of all the necessary houses and shops for the convenient and economical prosecution of the work. A good portion of the timbers and lumber they are using comes from Stockton by team, although the West Point mills are hauling some into the canyon.

Butte.

GOOD FOR FORBESTOWN.—About three months ago the splendid quartz mill owned by Alvinza Hayward and others, located near Forbestown on the Shakespeare lode, was closed down. It was said at the time that the mine had not paid expenses, but this was not verified by any person who owned an interest in the property. Forty men were thrown out of employment and that caused the people of Forbestown to feel blue, and when the Denver mill was also closed uneasiness prevailed quite generally in the camp.

Monday the Shakespeare mill was started up, and in a few days the mill will be working a full force, the prospects being very good, says the Marysville *Democrat*. It is said the Denver will also resume work in a short time, then Forbestown will again boom as it did one year ago.

Nevada.

FINE SPECIMENS. — *Transcript:* W. J. Rogers showed us to-day some beautiful quartz specimens that were taken out of the South Idaho mine. The ledge is eight inches wide, the rich streak from which the specimens were taken being about two inches thick. The prospects at the above mine are very bright.

INSPECTING THE PROPERTY.—Several of the owners of the Murchie mine are here thoroughly inspecting the property. There can be but one opinion about that mine, and that is that if thoroughly opened it would prove a paying property. When worked some years ago it gave employment to as many men as any mine in the district, and would do so again if properly worked.

WILL BUILD A DAM.—*Herald*: The Tully family are making arrangements to resume operations on the Omega mine. This old hydraulic mine was a famous "diggins" in its day, but has lain idle for a number of years by the decrees of the courts. Now the owners are preparing to build a dam to restrain the debris, so that they can mine once more.

The dam will be 62 feet high, and 192 feet long on the top, and will be built according to plans approved by the Debris Commissioners. Work will be commenced in about a week.

ANOTHER MINE.—E. A. Snider of Minneapolis, representing a wealthy syndicate of Minnesota capitalists, has bonded the Orleans Consolidated and the Contact mines, Gold Flat, and will develop them as one consolidated claim. Both are said to be good properties, and with good mauagement and solid backing a big mine may be made of them.

Mr. Snider is the gentleman who opened the Mt. Moriah mine, in Sierra county, last year.

THE EAGLE MINE.—Reports of a rich strike in the Eagle miues, five miles north of Reno, are received. They have attained a depth of 161 feet on the ledge. There were from five to nine feet of ore all the way dowu, but it was low grade. Now, at the depth of 160 feet, a rich vein of ore has been cut, samples of which assay as high as $3,000 in gold.

This is the mine which has heen supplying the reduction works with ore during the summer.

WASHINGTON MINES.—Correspondence *Herald*: The work of pushing the tunnel ahead at the Giant King Mine is rapidly progressing, and it is expected that the ledge will he struck at any moment now.

The company received about 500 feet of air-pipe this week, from Legg & Shaw of Nevada City, to place in the tunnel, but the teamsters had not got quite out of sight after unloading it when a tree that some young men were cutting on the hillside above fell and destroyed the entire lot. Superintendent Tozer has been husy ever since in an endeavor to get other pipe, as its use in the mine is imperative.

Frank Percival is having a crushing made at the Blue Jay mill of some of the ore from the ledge where he recently struck it so rich. We expect to hear of splendid returns.

At the Oak Tree Mine ten stamps have been running on the rock recently taken out, but the burning of the hoisting works has cut off the further supply for the preseut.

Running south in the mine on the 500 level, a large body of ore has been struck. The full width of it is not yet known, as no cross-cut has as yet been made. The ledge on the 800-level is also holding out well, and the appearance of the rock is very encouraging.

STRUCK IT RICH.—*Herald:* Rich ore has been struck in the Boss mine, near Sweetland. At a depth of eighty feet rock was found that assays $125 per ton.

The other locations on the same ledge are looking about as well as the Boss.

Sheriff Douglass will begiu work on bis claim, the Belle, on Monday.

Grass Valley District.

THE BELLE OF FRANCE.—On the mine known as the Belle of France, situated between the Allison Ranch and North Star, several thousand dollars have been spent in running tunnels, cross-cutting and sinking shafts on the mine, and several loads of rock have heen milled from a seven-foot ledge and also from an eight-foot ledge, which are fifteen feet apart. The seven-foot ledge yielded $5.50 per ton in free gold, and the eight-foot ledge $6.50 per ton. The sulphurets from the crushings were assayed by Pettjean of the Reduction works and went $255.55 to the ton. Three pounds of ore taken from across the ledge assayed $44.55 per ton in free gold. Forty feet to the west of these veins is still another, the outcroppings of the same heing fifty feet wide and is exposed on the surface for 1200 feet. This shows free gold and mineral, it probahly heing the main vein of the fissnre and heing a contact vein between slate and granite.

Placer.

THE HIDDEN TREASURE.—*Sentinel*: The Hidden Treasnre mine at Sunny South, Placer county, has incorporated. The business of the company will in the future be done under the name of the Hidden Treasure Mining Company.

The work of the corporation commenced July 3d. Twenty deeds to cover the transfers from the shareholders to the company were filed for record at Auhurn last Saturday.

The stock of the company amounts to 36,000 shares of the per valne of $10 per share. The shares in the Hidden Treasure are owned by Californians exclusively.

The following is a list of the officers of the new company: Harold T. Power, President and General Manager. J. A. Ferguson, Secretary. Directors—Harold T. Power, Mrs. I. M. Power, A. F. Boardman, F. Howell and R. M. Sparks.

The company have recently purchased the Dam tunnel, with tracks, water rights and dumping grounds, together with right-of-way for tailings in adjoining canons.

Several men are now at work in the tunnel. It is the intention of the company next season to erect works at the mouth of the tunnel.

The money is up and the company expect soon to acquire the Mountain Gate drift mine. The transfer deeds have nearly all heen made.

The Hidden Treasure Company now own three miles of channel, which comprises a surface area of about 2,000 acres.

By the acquisition of the Dam tunnel the company will he ahle to work their ground covered hy the hlack channel, or the same channel that is now heing worked within the lines of the Red Point.

The operations at the Hidden Treasure are the most extensive of any drift mining property in the United States.

THE MARGUERITE MINE.—*Herald:* The Marguerite mine, jnst north of Auhurn, has been producing some very good ore lately, and the company will probahly begin crushing shortly. They have ahout 200 tons of rock on the dump now, and the assays are above the average. This mine was recently the property of G. F. Deetkin, who is the preseut superintendent. The vein in this claim is adjacent to the Salsig lode which was a very rich one, and which yielded its owners thousands of dollars. The owners of the Marguerite are hopeful of developing an equally rich claim, and present indications point to its accomplishment.

Plumas.

THE REWARD MINE.—*National-Bulletin*: The owners of the Reward have a mammoth quartz vein 72 feet across. They have just finished cross-cutting it with a tunnel tapping the ledge 500 feet from the surface. The east wall is granite and the west is porphyry, the vein standing nearly perpendicular. By means of a 1,000-foot tunnel the vein can he tapped at a depth of 1,000 feet. The ore carries both gold and silver—$10 per ton, in gold, would be a very low estimate, though a yield of half that amount would make it one of the best propositions in this part of the State.

THE REDBIRD MINE.—*National-Bulletin:* This property is owned hy Messrs. Scott, Christy & Carothers, and is in Hope ravine, Mohawk valley. By means of a tunnel, the owners have just finished cross-cutting the vein, which is 38 feet wide. The strike of the ledge is from northwest and southeast, with a dip of 70 degrees. The vein matter is of a soft, decomposed nature, is about one-fourth sulphurets, and strongly copper stained. Some galena also is to be found in the quartz. The gold is scattered all through the ore, which prospects well. This large body of quartz, by means of a tunnel, can be tapped 250 feet deep.

San Bernardino.

MORE BIG NUGGETS—The desert gold camps are showing unexpected staying qualities, says the San Bernardino *Times-Index*. It was predicted that they would not last long, but that seems to be a mistake. Goler is yielding more gold now than at any time since its discovery and the yield of big nuggets, for which it is famous, still continues. George Swarthout is just in from Goler, hringing with him a nugget weighing hetween twenty-four and twenty-five ounces and worth $430. This was found in the Bensen gulch, which has heen famous for its big nuggets. It was discovered fifteen feet helow the surface and about three hundred yards from where the noted $1,000 Reed nugget was found. Mr. Swarthout reports that many nuggets worth from $20 to $150 are found in that locality, besides the usual fine placer gold.

Shasta.

THE SPANISH MINE.—*Courier*: The Spanish mine is developing into a promising mine under the energetic management of James Sallee and Wm. Chynaweth. Three eight hour shifts have heen rushing work on the mine for some time, sinking on the ledge, and the new management have knocked out the old theory that ledges in that vicinity do not hold out below water level for they are down over 40 feet helow, and the prospects are getting hetter if anything. They have run through a splendid chute of pay ore, and some time ago they shipped, loose, eight tons of unassorted rock as it came from the shaft, to the Selby Works, and the returns were flattering indeed. It is probable that a five or ten stamp mill will be erected soon at the mine. The Spanish is an old location, situated about a mile and a half from Shasta, and its development gives employment to a numher of men.

NEVADA.

Washoe District.

THE "WEST COUNTRY."—*Enterprise:* The region lying to the westward of the Comstock lode, known as the "west country," contains many large veins, as the Cole, Santa Rita, and others that show good prospects in gold at and near the surface. The only work done on the majority of the veins in this western mineral helt amounts to little more than surface scratching. The Cole, the most easterly of the west country system of veins, is the only one among them on which regular mining work has ever been done.

A surface deposit found in the Cole was worked over twenty years ago, and yielded several hundred thousand dollars. The company went down on this vein until stopped hy water, when they ran what is known as the Cole tunnel in order to drain their ground. They obtained an immense flow of water in their tunnel, and inste d of doing further work in their mine, turned their attention to supplying the town with water. The pay obtained in the Cole was in gold, and the croppings of all the veins in that direction show more or less gold.

Between the Comstock proper and the system of veins forming the mineral helt of the west country lies a rib of hard rock (usually looked upon as the footwall of the Comstock) varying in thickness from 100 to 1000 feet. This hard rock constitutes a large "horse." It is probably an immense slah of rock which at depth "wedges out." It is this big slab or rih that the West Con. Va. & Cal. Company have heen passing through. Once they get through it they will find a region of softer rock and veins of fertile quartz. Indeed, they have recently cut into a streak of quartz that assays well in gold. This shows that they are nearing, if not already into, the west country.

The veins of this west country were undouhtedly filled from the same snhterranean sonrce as the Comstock, and probably at the same time, the fissures containing the two sets of veins heing formed hy the same volcanic disturbances. The parallel veins in a mineral helt nearly always exhibit the characteristics of the principal vein of the system.

There is, therefore, no reason why the veins to the westward of the line of the main Comstock should not carry a paying amount of the same metals that are found in the eastern fissues of the mother lode.

The wonder is that this unknown west country should have been allowed to lie almost untouched foi over thirty-four years. It is probably hecause our people were fully occupied most of the time in mining the rich honanzas of the main lode. As these west veins are gold bearing—at least at and near the surface—ores of a low grade may be worked to a profit, as gold ores may readily be concentrated and all the contained sulphurets saved.

All who feel an interest in the welfare of the people of the Comstock will he glad to see that an exploring drift is at last heing pushed out into this west mineral helt at such a depth as will properly prospect the vein it contains. Besides the veins showing prominent croppings at the surface, other veins that do not crop out are liable to be found. Indeed, there are no end of possihilities in this unknown west country, and all mining men will watch with interest the exploration work now being done in it by the West Con. Virginia & California people. In that direction lies the salvation of our city.

Kennedy District.

GOLD STILL IN SIGHT.—*New Era:* The big strike in the Imperial at Kennedy continues to show an eight-foot vein of galena, and the extra rich foot of ore next the hanging wall, which gave $104 in gold, has increased to a foot and a half. Just before noon yesterday thirteen buckets of ore were hoisted, which were so nearly pure metal that it is estimated the weight of each hucketful was 750 pounds.

Hawthorne District.

Walker Lake *Bulletin:* The lessees of the Pamlico are taking out some very rich ore again, and the showing is very good.

Jack Hall and Charley Forhes are working with the dry-washer on the Box claim. They are working the surface dirt in the canyon and on the side hill, and are getting on the average about an ounce a day in gold. As this gold is worth ahout $18 per ounce, they are doing very well. Their work has demonstrated that there is room for 100 men or more to get profitable employment with dry-washers along Never Sweat gulch and the main canyon helow the Pamlico. In addition to the gold in the surface dirt, they find howlders of quartz which, when hroken with the hammer, hang together with gold. In one place they have a shaft twenty feet deep in the gravel wash which is not down to hedrock yet, and which shows pay dirt from top to bottom. In all prohability the gulch below the Central mine, the wash below the Lapanta, the Evening Star gnlch and the Mountain King gulch would all pay handsomely, if worked in this way.

RICH GOLD DISCOVERIES.—*Enterprise:* Gold-hearing veins assaying from $180 to $1000 a ton have recently been discovered in eastern Nevada on Sheep mountain, at the lower end of Pahranagat valley. There is a rnsh from Ferguson district and other points to the new strike. Even the rauchers of Pahranagat have caught the gold fever and are "mounting in hot haste" and heading their mustangs for Sheep mountain. Indeed, the big find was made hy two Pahranagat valley men. It, therefore, is a ranchers' find. This, with a hig gold discovery some distance below, at St. Thomas, and the rich mines at Ferguson and Osceola, shows that an immense gold helt exists in eastern Nevada out toward the Utah line. Nevada is fast hecoming a "Golden State.

In Ferguson district, eastern Nevada, Captain De Lamar, the millionaire mining man who has purchased several gold mines that he is preparing to work on a large scale, is sinking an artesian well eight inches in diameter. The Captain hopes to get a flow of water sufficient to run his new 100-ton chlorination mill. He is prepared to sink the well to a depth of 3000 feet unless water shall he encountered at a less depth. This enterprise will he of value to all in that part of Nevada, miners and ranchmen alike. It will he a big thing for them to have a man of almost unlimited capital come into that dry section and sink a test well, a work they were not ahle to undertake. Should the well prove a success it will lead to the putting down of many others on mines, ranches and stock ranges. The experiment is the result of getting a millionaire interested in our mines.

ARIZONA.

FROM HARQUA HALA.—Phœnix *Republican:* Everything is running along as usual in the great mining camp of Harqua Hala. The mill is running in full blast and there is gold in abundance.

Within the last week several miners have left the camp with their hard earned money, and, if reports are true, with plenty of gold taken from the mine without the knowledge of the members of the company. Some were caught with hottles of the yellow metal. Two hottles of gold were taken from the cabins of two miners. Of course nothing was said to mar the happiness of the company. This may account for the shortage of the gold output for this company has been from $10,000 to $20,000 short of Mr. Huhhard's cleanups and this company has doubled the amount of stamps at work that Huhbard and Bowers had. Of course no assets were showu.

Miners from all parts of the country are seen at Congress waiting for work in the mine. Many of these meu are old and tried hands in Arizona mines.

THE GLOBE MINES.—*Gazette*: News from Globe is that the Old Dominion Company while closing down the smelters, has not by any means stopped work on the wounderful copper mines of its group. It is understood that work for some time has been handicapped by the fact that the stopes were not extensive enough. Sixty men, comprising about all the married men on the force, have been retained and are now busily doing development work running new levels farther into the ore body and sinking the main shaft a hundred feet more.

It is understood that the company is not designing working in the near future any of the rich ores below the 350 foot level. Above this level the ores while less rich than below are of a free carbonate character, readily run through the water jacket furnaces. The deeper ores must he treated hy some other and more expensive method, by reason of their high percentage of sulphur.

It is understood that the bullion output will be resumed as soon as a sufficient amount of new ore has heen exposed to stoping in the new levels now heing run, while in the meantime the more distant ore bodies will he explored hy means of a diamond drill.

COLORADO.

GUNNISON COUNTY.—*Mining Industry and Tradesman:* The newly discovered gold fields are 12 miles from here. The general surface is hilly, hut not ahrupt, and devoid of timher except on the northern slopes, where red spruce is found. A deposit of disintegrated rock, with hut little clay covers the surface, usually to the depth of two or three feet, except in the valleys, where it is much greater, and where good grass is found. There are numerous springs, but there is no hody of water sufficiently large to furnish much water power nearer than the Cochetorpa river, some four miles distant, or the Tomichi, ten to twelve miles away.

The native rock is granite, but has been changed hy later heat to a crystalline nature, gneiss. Through this the veins have heen forced upward, and a scope of country ahout a mile wide and four miles long shows quartz hearing veins, running in a general east and west direction, through some of the veins have a southeastern and northwestern course.

The veins so far opened, show a width of from a few inches to several feet—perhaps three feet would he a fair average. The ore is generally a dark, iron-stained quartz, yet some of it is almost white. Ahout fifty claims now show free gold in the rock. Assays show values of many thousands of dollars, hut that is hut a poor test.

There are now ahout 300 men in the locality, living in tents or rude cahins, as the camp is hut a few weeks old. The men are hard at work doing the required assessments on their several claims, and there are hut one or two shafts over ten feet in depth. One is down 35 feet, and a piece of ore from the hottom showed well in gold. Some huilding is now heing done. But the miners are poor, as they proverhially are, and of themselves they can do hut little to develop their properties by deep shafts.

UTAH.

THE MERCUR MINES.—*Mercury:* The building of the Geyser mill continues to he the main topic of interest in mining circles, and it is the general impression that its completion will mark a new era of prosperity in the camp. No new developments of importance have heen reported during the week, though good reports from the mines and prospects are the rule.

Messrs. Edwards and Booth, who have a contract on the dump of the Mercur mill, have commenced the work of extracting the gold which still remains therein. A *Mercury* reporter visited the plant the first of the week

and found everything running smoothly. The plant is equipped with three iron ore tanks of a capacity of eighty tons, and from present indications the operators will be able to haul and unload them every twenty-four hours. The tanks empty from the bottom, which saves a large amount of labor in the handling of the tailings. A cleanup will not be made for some time, as it takes longer for the zinc to become loaded, of course, than when the ore first goes through the mill, carrying a much larger per cent of gold. Messrs. Edwards and Booth expect to work the tailings at a profit of from 75 cents to $1 per ton.

MONTANA

THOUSAND DOLLAR ORE. Missoula special to Butte *Miner*: Parties from Rock creek report that there is considerable excitement over some recent discoveries made in that section. Rock creek comes into the Missoula river about twenty miles east of this city. Bonita is the nearest station, on the Northern Pacific. The country has been known to contain gold for many years.

Welcome gulch, one of the tributaries of Rock creek, was rocked extensively during the early days of placer mining in Montana, but was never classed as one of the rich gulches. Welcome was worked for a number of years by Chinamen, and white men have mined in it more or less continuously of recent years with only moderate success.

The new discovery that has attracted attention recently to the district was made by two Swedes not familiar with mining. The ore is said to assay from $800 to $1000 in gold, and some very handsome specimens of gold quartz have been exhibited as coming from it. Philipsburg parties have obtained a bond on the property for $20,000, paying $1,500 down. They are working about twenty men. A number of prospectors from Philipsburg and other parts have rushed in and there are now about 200 in the camp. They are coming in at the rate of fifteen or twenty a day. A large number of locations have been made, some of which are said to be good prospects. The present indications are that there will be a big rush into the camp this fall.

IDAHO.

LOST RIVER.—The smelter for the copper company at Lost River is running successfully. Charles Clark, is general manager for this company and they intend to make a thorough test, and if successful, will put in extensive smelting works.

GENERAL NOTES FROM CHALLIS.—George L. Sheldon, superintendent of the Idaho Gold Mining Company, at Yellow Jacket has secured all of the pack-trains available to pack the 40-stamp quartz mill to the Jacket, besides the vast amount of supplies that will be necessary to run the company until spring. Three large trains have been running between Challis and Yellow Jacket constantly since early this spring, making round trips every five days, and the demand is now so great to get in machinery and supplies for winter use, for the different companies operating there, before the snowstorms set in, that it is found necessary to double the packing facilities. There are three companies at present operating at the Jacket employing about 125 men and the force is being increased as fast as arrangements can be made for them to work. The Columbia Company, owned and operated by Howe & Ellis, of Denver, Colorado, are erecting a 10-stamp quartz mill. A portion of the machinery for this mill has already been taken in, and the rest of it is in Challis awaiting shipment. When completed it will be a modern improved mill capable of treating 20 tons of free milling ore per day, and will employ quite a force of men to operate it, but at present only about 30 men are at work grading and constructing the mill. They have a good mine, and it is showing a large body of milling ore. Another enterprising company of considerable note operating there, is the Yellow Jacket Placer Company, owned by Mr. Coleman, and managed by Messrs. Pinney and Fox. This placer ground was formerly owned by Messrs. Lane, Hensely and Jones, and purchased from them last winter by Fox & Pinney, from Mr. Coleman. They have 45 men at work and are getting things in fine shape to commence mining. A double compartment 7-foot bedrock flume is nearly completed—1,100 feet of it. When completed it will be 1,500 feet when bedrock will be reached.

THE COMET MINE.—The Comet mine, on the divide between Soldier and the Smoky country, is showing very finely. Niel Shroder of Glean's Ferry is one of the heaviest owners in the property, which he has been developing for several years. The tunnel is in 300 feet, and there is seventy feet in shafts. Lately some red decomposed ore was struck and sunk on six feet, the ore showing well in assays, the lowest in thirteen running $28 in gold and four ounces in silver, while the highest went six ounces gold and twelve ounces silver. The gold is of the finest quality, running up to $21 per ounce. The vein lies between porphyry and granite, and ranges from fourteen to twenty feet wide and has a dip of about 40 deg. There is no base in this ore except iron, hence is easily milled.

FAIR ORE.—Weiser *Signal*: The 1600 pounds of ore brought out from Warrens by pack-train and shipped to Salt Lake by ex-Governor Willey, has netted him $517. He is now having a carload of second-grade ore packed out for shipment; it is being piled in Ennor Bros.' corral. This "second grade," as they call it, will mill $250 a ton.

WASHINGTON.

THE OKANOGAN COUNTRY.—*Outlook*: Three four-horse freight loads of machinery for the Bridgeport Mining & Milling Company arrived Tuesday. The big boiler and balance of the machinery will be up in a couple of days, when the work of setting up the plant will be commenced at once.

The Rush Mining & Milling Co. has decided to commence work on the big tunnel on the Rush mine, and men are surveying the site. It is a working tunnel and will tap the big vein and ore chute at a depth of 500 feet.

S. S. Collins and R. Greiger from the Slate Creek country, corroborate the stories of the rich placer strike. They brought in a sack of ore from their claims. The quartz is honeycombed and shows lots of free gold. The placer is regarded by all who have been there as the richest discovery ever made in the northwest. As an illustration, he says, a piece of decomposed quartz weighing about ten pounds was found, which, when pounded up and panned down produced $8 in gold. The gold is very coarse and nuggets weighing from 25 cents to $1.25 are not uncommon. The boys expect to make a cleanup of between $1000 and $5000 before snow flies.

Thos. Burke has returned from a trip through the Squaw Creek and Gold Creek camps on the Methow, and reports mining operations fairly active in both districts. In Squaw creek the arrastras are grinding right along and the new stamp mill will be ready for business in about a week. On Gold creek about a half a dozen placer miners are washing gravel. As yet they have not thoroughly tested the ground, but claim to get very satisfactory prospects. They are sinking a shaft to bedrock, and at the time he was there were down 30 feet. A great many of the prospectors from both of these camps have gone up to Slate creek, where an immensely rich placer discovery is reported to have been made and miners are flocking there from all directions. It is said that over 400 locations have already been made since the strike.

A GOLD BRICK.—Spokane *Spokesman-Review*: One of the largest gold bricks ever brought to this city is locked in the vaults of the Traders' National Bank. It weighs 254 ounces, and is worth about $315.50 per ounce, there being some silver in it. Its value, therefore, is not far from $83,500.

This brick is the product of the Cariboo Mine, on Rock Creek, B. C., the property of Messrs. Monaghan, King and Smith of this city, Hayden Lake and Portland. It represents a fifteen-day run on their ten-stamp mill, recently erected. The brick came to Spokane in a roundabout way via the Canadian Pacific.

Messrs. Monaghan and Smith have returned from a trip to the mine. The Little Bonanza is situated on Rock Creek, a tributary of Kettle River. To reach it there is a stage journey over mountain roads of 112 miles. The mine is now giving work to about thirty men.

On this trip Messrs. Monaghan, King and Smith bought a big placer property at the mouth of Rock Creek, fourteen miles from the Cariboo, and Mr. King remained there to push work on it. As a result of a little prospecting on the ground they brought out a vial of beautiful coarse gold. This mine is a new undertaking. It has been worked off and on since 1860, and has yielded up enormous dividends. The improvements put upon the property have cost not less than $30,000. Recently it passed into possession of Hatican, McCuaig & Cameron, and was by them sold to the present owners. A great deal of ground has never been worked at all, and after a few days prospecting on the area, the buyers concluded that the property was a bonanza yet. After the transfer had been made the former owners offered to take the mine back and forfeit an amount equal to the first cash payment.

BRITISH COLUMBIA.

GENERAL NOTES.—The Poorman stamp mill, near Nelson, has been closed for want of water.

A strike of 450 ounces in silver has been made within a mile and a half of Bear lake.

Assays as high as 277 ounces in silver have been obtained from the Boston and Winnifred claims, in White Grouse district, near Kaslo.

It is proposed by the Cariboo Mining company to stock the Cariboo for $500,000, and the Amelia for $300,000. These claims are in Camp McKinney.

The last clean-up on the Cariboo, Camp McKinney, was the result of 19 days' run, and realized between $9,000 and $10,000. The bullion went to Spokane.

All the machinery in the Silver King and Kootenay Bonanza mines, on Toad mountain was started up recently and found to work satisfactorily. The diamond drill, which is run by compressed air, made eight feet the first day, although run but a short time.

The buildings of the Noble Five group, burned in the recent bush fires, have been replaced by larger and better ones, and 17 men are engaged sacking ore. The owners are discussing whether it will be profitable to team the ore in winter time to Kaslo and sell to the Pilot Bay smelter, or to ship by the railway.

J. C. Haas has located a north extension of the Helen, in Boundary creek, called the Mystic. Assays have run from 111 to 160 ounces in silver, and $22 to $26 in gold.

A road has been surveyed from Three Forks up Carpenter creek to the mouth of Cody creek, a distance of five and one tenth miles. The average grade is five per cent, and the estimated cost $1,000 per mile.

AUSTRALIA.

THE USUAL BIG STORY.—Advices from Australia by the steamer Warrimoo, which arrived at Vancouver, B. C., on the 10th, say that another immense nugget of gold was found at Coolgardie, eclipsing the famous Londonderry find. The nugget, which has been called the Dunn nugget, after its finder, weighs 1800 ounces and is worth over $30,000. It was taken from a reef, the whole face of which glitters with gold. Tremendous excitement prevails, and since the find property has increased at the diggings 500 per cent.

The laboring miners have struck at Coolgardie and demand £4 a week. They have armed themselves with rifles to prevent outsiders working in their places. Bloodshed is feared.

Four thousand people are camped around where Dunn found his nugget.

Coast Industrial Notes.

—The Alaska salmon pack is about 600,000 cases.

—Prime wheat is selling for twenty-eight cents a bushel at Pendleton, Or.

—The Rocklia Granite Crushing Company has been incorporated. Capital stock, $10,000.

Telegraphic communication is now established between Reno, Nev. and Susanville, Cal.

Richard Gird has finished placing $300,000 worth of new machinery at his beet sugar factory at Chino, Cal.

—A Port Angeles, Wash., lumber company will furnish 3,000,000 feet of cedar for railway work in the Hawaiian islands.

G. W. Hunt has contracted to build 100 miles of road from Fort Bragg, Cal., to Mt. Vernon coal mines for the Overland Pacific Railway Company.

G. W. Strong, 10 Stevenson street, this city, has an amalgamator and settler that is claimed to be of practical value in handling gold bench sands. Its capacity is one and one-half tons.

The Portland Cable Railway, which has been in the hands of a receiver for several months, was sold at public auction on the 10th inst., for $41,718. It was bid in by F. L. Brown of San Francisco.

The Pryhiloff seal contractors killed this year about 16,000 of the 20,000 seals that the Government permits to be taken from the rookeries. Besides these, the sealers who were taking seals in the open sea killed 30,000. At this rate the seals will be exterminated.

David Patterson, master mechanic of the Union Pacific, has invented a painting machine with which he proposes to paint the hulls of ocean-going vessels at considerably less cost than the present system of hand work. He says his machine will also economically paint and sand mills and hoisting works.

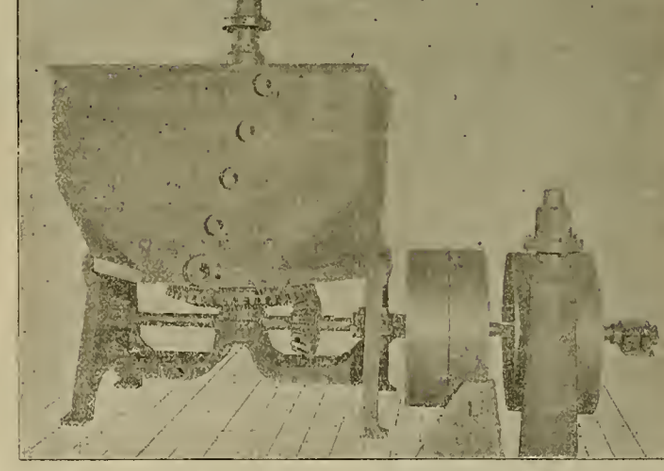
—Several citizens of Portland, Or., have formed a corporation, with a capital stock of $1,000,000 to build beet-sugar factories in Oregon. K. G. Korn, recently of Germany, who is one of the incorporators, has made an extensive chemical examination of the soil in different sections of the State with very satisfactory results.

—The magnitude of the coal deposits in the State of Washington is little realized away from the Pacific coast. Not all the Atlantic States combined contain such a supply. Workable veins are known to exist in eighteen out of the thirty-four counties, and they cover an area of more than 1,000,000 acres. The coal ranges in character from Cannel to semi-anthracite, through all grades of domestic, gas, steaming, cooking and smithing coals. With the exception of the Roslyn mines in Kittitas county, the productive measures lie west of the Cascade range. They are all lignite and bituminous. Anthracite has been found in the Olympics and in the Cascades, and there is a fine deposit at the base of Mount Rainier. These, however, have not been developed sufficiently to judge of their values. The liguite measures extend from British Columbia on the north to the Columbia river; and east from Puget Sound fifteen miles. The area covered is estimated at 800,000 acres. Less than two per cent of it is owned by companies prepared to open up veins as soon as the market is ready for the output.

—President C. P. Huntington of the Mexican International railway has ordered that the line be immediately extended from Mexico to Sierra Majado mining camp. Nearly all of the grade of this extension was completed about two years ago, but work was suspended owing to the financial depression. A branch of the road is also being built from Reata to Monterey. J. A. Robertson, general manager of the Monterey & Mexican Gulf road, is now in New York arranging for the extension of that line from Trevino to Sierra Majado and thence to Mazatlan.

—Mathew Gage, the originator of the irrigation system which bears his name, and by which several thousand acres of land in Riverside and near by are watered, has sued to recover $500,000 from the Riverside Trust Company and the Northern Counties Investment Trust of London, England. He alleges that these corporations have conspired to freeze him out of his entire interest in the great system which he had built after years of toil. In 1890 the Riverside Trust Company was organized and bought from Gage 7000 acres, together with the Gage water system, giving him in return 1700 shares of the Trust Company's stock and promising to pay him £38,000 out of its earnings. The next year Gage says that the Trust Company had a surplus of $200,000, but refused to pay his claim, and, being pushed for money to carry on his schemes, he borrowed £18,000 from the North Counties Investment Trust, giving that concern as security his stock in the Riverside Trust Company and his claim against it for £38,000. Gage alleges that the English corporation was heavily interested in the Riverside Trust Company, which is also an English company, and conspired to prevent him from realizing anything on his stock or claim. The Northern Counties Company, it is alleged, induced the Riverside Company to repudiate the statement which it made in March, 1891, that it had a surplus of $200,000, which, under the terms of the purchase, should have been used to pay off the indebtedness to Gage. The complaint also declares that the value of the stock and claim amounts to $750,000. Gage asks the court to order an accounting to declare that £38,000 is a vendor's lien on the land and water rights sold by him to the Riverside Trust Company, that the stock transferred to the Northern Counties Company he returned to him, and that he have judgment for $500,000.

Amalgamator and Settler.



THE ABOVE CUT REPRESENTS A COMBINED PAN AND SETTLER for the purpose of working Mill Tailings, Concentrations, Sulphurets, Tellurides, and Refractory Gold and Silver Ores, by the Steam Pan Process, or by Roasting and Amalgamation.

Will handle Gold-Bearing Beach Sands the best of any mining machinery now in use.

It is designed for grinding and amalgamating the ore by a rapid movement of the shoes and Muller, then change the speed to a slow movement of the same, and let in water to settle and flow out at the upper plug openings at first, and so on till all the pulp has left the pan, and the gold and silver with the quicksilver remains in the bottom of the pan to be taken out at pleasure, or after a large amount of ore has been worked.

These pans are manufactured of good material, in the best workmanlike manner, and warranted to do the work for which they are designed. They work by charge. Capacity, one and one-half tons. Weight of machine complete, four thousand five hundred pounds.

Small Laboratory Pans of fifty pounds capacity are also provided of the same pattern as the large size, for the purpose of trial tests, which are kept in constant practical use at the sampling works, **10 Stevenson Street, San Francisco, Cal.**, to determine what process is required in handling different ores.

Mining property examined, analysis of ores, plans, specifications, estimates of cost, and information as to the most profitable way of opening up and developing mines and milling ores.

G. W. STRONG, San Francisco, Cal.

Electrical Progress.

The Storage Battery.

The storage of electricity, or rather the possibility of creating and retaining a potential difference within a glass or metallic vessel, first evinced itself in the discovery of the Leyden jar, which occurred in 1745.

Ritter and Gautherot, in 1801, demonstrated the principle of electrical storage by immersing two plates of the same metal in acid, and having subjected them to the action of an electric current in one direction, connected the plates to a galvanometer and observed the production of a secondary current in au opposite direction.

In 1842 Grove constructed a gas battery, on the principle that the oxidation of the copper anode in an electrolytic cell produces electrical storage, which consisted of a three-necked flask, containing acidulated water, into which was inserted two tuhes containing respectively oxygen and hydrogen. Platinum wires sealed into the upper ends of these tubes were connected with platinum electrodes in contact with the gases ahove and the water helow; thus the external circuit was completed through copper conducters whose terminals dipped into mercury cups. When the circuit was closed the gases recombined to form water, thus generating an electric current, which in the cell flowed from hydrogen to oxygen and externally from oxygen to hydrogen, and whose E. M. F. was equal to that required to electrolyze water, so that the storage of electrical energy hy chemical decomposition was recovered hy chemical recomposition.

In 1859 Gaston Plant's discovery of the special adaptation of lead plates for this purpose opened the way for the practical use of electrical storage. Plant constructed a cell using as electrodes two large sheets of lead rolled together and electrically insulated from each other hy strips of gutta-percha. They were then immersed in acidulated water, in a tall glass jar, and subjected to the action of a hattery current supplied hy two or more cells. The chemical reaction which followed resulted in creating a difference of potential between the terminals which manifested itself in the discharge of the cell.

The tedious and expensive process requisite for the electrical formation of Plant's plates led to the invention of Camille A. Faure, ahout 1880, of plates prepared hy covering sheet lead with a paste made of red lead and sulphuric acid, the coating heing confined to the surface hy a covering of paper and hy felt placed hetween the plates, which also served the purpose of insulation. Thus prepared and rolled together, they were placed in a glass jar with acidulated water, and the coating suhjected to electrolysis, and with alternation of current was, in a few days, changed to a spongy lead of different chemical composition than at first, the cell then heing ready for practical use.

While the Faure cell could he produced much more economically than the Plant, and was equal to it in electrical energy, it had such serious defects that its utility was circumvented. The felt preventing the free circulation of the current, and seriously impeding electrolysis, it soon became corroded by the acid and partly removed in patches, and ceased to insulate. The coating failed to adhere properly, sloughed off and fell to the bottom. Hence, in a short time, the cell proved worthless. But its invention serving to direct the attention of men like Brush, Swan and Sellon to his field, resulted in the inventions of many greatly improved storage hatteries.

The storage battery of to-day, though not perfect, has nevertheless rendered much valuahle service. Its applications are varied, and while not as yet very extensive, they are sufficient to indicate that storage hatteries may, in the near future occupy a very important place in the electrical industries. A fortune awaits the lucky man who invents a storage hattery that will overcome all the ohjections to those in common use; and can confine electricity in considerable quantities within a small vessel, which will ever he ready to do man's hidding.

Storage Battery Impossibilities.

Occasionally we read, says the *Electrical World*, in newspapers, predictions of the possihilities of the coming storage battery, and some enthusiasts have even prophesied that when "perfected," ocean steamers will he propelled hy this popularly misunderstood apparatus. While, of course, every one with au iota of electrical knowledge recognizes the ahsurdity of such a claim, yet au illustration of how absurd it is may be of interest, and to furnish this we will apply the necessary calculations to the case of the new Cunarder Campania. The hest transatlantic time of which we have a record made by this ship, whose displacement is 18,000 tons, was 5 days 12 hours and 15 minutes, during which the average speed was 21 knots, corresponding to ahout 26,000 average horse power and a consumption of coal for the trip of ahout 2,700 tons. Assuming storage hatteries of fifty pounds to the hourly horse power, the entire weight of hatteries to do the same work, and allowing for no reserve, would he 76,750 tons of 2,240 pounds, or more than four times the entire displacement of the ship. To determine the weight per horse power that a storage hattery should have to compete with steam in the case under consideration, we will assume that the eutire weight of the hoilers aud machinery of the Campania is 3,750 tons, which is prohahly near the actual weight. Adding the coal consumption for a trip, 2,700 tons, we have 6,450 tons as the entire weight of the electrical plant. Assuming the weight of the electrical propelling machinery to he 1,500 tous, we have finally for the total weight of the hattery 4,950 tons. With these data we find that the weight of a hattery, allowing for no reserve, would have to be 3.16 pounds per hourly horse power. How small this is can he appreciated from the fact that a 150 ampere-hour cell would weigh on this hasis only about one and a quarter pounds, really about the weight of its lugs. A similar calculation would show the impossihility of storage hatteries displacing locomotives, yet the writer knows of a company formed several years ago which spent several thousand dollars in attempting to perfect a battery for such a use. Much of the misconception in regard to the power of the storage hattery must hc ascrihed to the sensational manner in which it was introduced to the puhlic hy a very great scientist, his statement in regard to holding "one million foot pounds of energy" in his hand not yet having lost its effect. The great value of the storage hattery in its proper field, which is of vast extent, and as yet scarcely entered in this country, should be sufficient to satisfy its most sanguine friends. Only harm can come from making claims heyond its power to fulfill, and much harm in this way has heen done, aside from the ahsurd instances we have here considered.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, hoiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could he conveniently removed. Can he had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Franoisco.

Gold Quartz Mine For Sale.

A Good Quartz Mine, near Scott Bar, Siskiyou county, is offered for sale. Parties wishing to invest in quartz-mining property will do well to examine this ledge, from the extension of which ten-dollar rock is now heing crushed. The average width of the ledge is two feet. For further information, call on or address W. A. CHAMBERLAIN, Yreka, California.

Practical Information.

Extraordinary Degrees of Cold.

It is a well-known fact that the zero point of the thermometer—*i. e.*, the temperature at which ice melts in our atmosphere—is only considered to be arbitrary in scientific circles. The temperature *above* zero is probably unlimited. However, it appears certain that at a temperature of about 6000° of heat the component parts of our earth would liquefy and evaporate, whereas at a temperature of 273° below zero everything would freeze and chemical activities would cease. This unknown degree of cold has been somewhat closely approached by R. Pictet by means of a very peculiar method. He employed various freezing mixtures, one after the other, the temperatures of which grew lower and lower; and at the same time he conserved the cold in special apparatus, termed "cold cells or wells," and thus obtained the desired result.

The liquid medium used by Pictet in the first "cold cell" was of his own invention, and consisted of liquid carbonic acid and sulphuric ether. With this he obtained a temperature of 110° below zero. He plunged a condenser into these first cold cells, in which the vapors of the highly volatile nitrogen monoxide were deposited; by this means he created a fall in the temperature to 150° below zero, and thus obtained the second "cold cell." In this cell condensation of nitrogen gas, atmospheric air, etc., took place at a high pressure. At this time the temperature fell 210° below zero. These experiments have paved the way for the production and employment of absolutely enormous pressures. The temperatures were measured with hydrogen thermometers which were graduated by comparison with sulphuric ether thermometers. Pictet had the satisfaction of seeing atmospheric air in his apparatus in the guise of an azure-colored liquid. With a temperature ranging between 100° and 150° he was able to obtain a sound from solid quicksilver and to study alcohol, ether and chloroform in the solid condition.

A Familiar Optical Illusion.

It is well known that the sun appears much larger when setting than when it is at a considerable elevation in the sky. This fact is commonly ascribed to the greater facility of comparison, in the former case, between the dimensions of the solar disc and those of terrestrial objects on the horizon. Professor S. P. Thompson suggests that the effect is in some considerable part due to the greater redness of the sun, viewed through an atmospheric screen of much increased thickness. Red is, of course, an "advancing" color, while the more refrangible rays "retire." It might be supposed that a simple experiment with a blue glass screen would discover what share the mere altered color of the sun's disc has in producing the effect above noted. But the brightness of the image is another factor which it may be necessary to take into account, and by which the effect sought might be masked in this experiment. A red glass screen interposed between the sun and the eye at midday would be a better test of the theory.

THE early astronomers were all astrologers, and claimed to be able to predict the future career of various individuals by "casting horoscopes," showing the movements of the planets at the time of their birth. The position and movements of the various celestial bodies were not only supposed to control the destinies of men, but were also thought to bring weal or woe, tempest or sunshine, upon the earth itself. A man born when the sun was in the constellation of Scorpio was believed to be naturally bent toward excessive indulgence of the animal passions. One born when the sun was in Pisces was predestined to grovel or be a servant, while one whose earthly career was opened when the great luminary was in Aries would be a great scholar and a man known to the world despite all opposing influences.

THE great 3,000,000-candle power search light, the largest in the world, which was built especially for the Columbian Exposition and which played such an important part at the Midwinter Fair, has found a final resting place in southern California. The light has been purchased by Prof. J. B. C. Lowe, the builder of the great cable incline railway, and will in future flash its rays over the San Gabriel valley from the summit of Echo mountain.

Free Electricity.

According to a New York man, there are a number of places in the city of Brooklyn where electricity may be had free of charge by simply connecting wires between water mains and gas pipes where they enter buildings. Along the lines of the trolley railways in Brooklyn there is a very extensive discharge of electricity into the ground, and these currents find their way to the water pipes and gas pipes. It is said that in some cases electricity enough to run fans and sewing machines, to the extent of over one-horse power, can be had; it is stated that the gas pipe in almost any house near the trolley lines will give seven amperes and 300 volts, sufficient to run seven sixteen-candle lights. Such a current would do very much better than this. One of the experts said: "If you drive a couple of gas pipes to the return leg under the railroad track, you can get sufficient power to run heavy machinery." As this power seems to be running to waste in the ground, says the *Scientific American*, there appears to be no satisfactory reason why it should not be made use of free of charge by any one who has the good fortune to live along the line of the trolley railway. It is different from secretly tapping water pipes or gas mains. This electricity is running in the ground; it has been discharged or thrown away by the railroad company, which, consequently, can have no claim upon it.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 13, 1894.

The New York price of lead dropped to $3.05 during the week, the lowest notch, so far. The new tariff takes off one cent a pound duty, and Mexico can send in its output now under what amounts, practically, to free couditions. Utah is still seething over the manipulations of the Lead Trust. W. F. James, the president of the Ore Producers Association of Salt Lake, tells the *Tribune* that one series of prices sent out hy the trust was for wholesale purchasers, the other for retail. By a rule of the Metal Exchange any quantity of lead sold under twenty-five tons was a retail quantity, and established no market price. Lots of twenty-five tons and over were wholesale, and determined the market price. Of course the metal market manipulator must have been a party to the fraud, either wittingly or unwittingly. As much as 500 tons of lead have been sold in one day to one buyer, and all in lots of less than twenty-five tons, and for prices from $4 to $8 per ton ahove the price telegraphed on that day as the market price which the producer had settled upon. And as the Lead Trust and combine controls all the lead iu the United States they would not offer as large a lot of lead as twety-five tons for sale in a single lot.

When there was no huyer on the market except themselves, they would huy it in, thus fixing the price of lead to buy at where they wanted it; and wren purchasers appeared they would supply them with what they wanted in small lots, at advanced prices; but under the rule of the Metal Exchange these prices could not be sent out, as they were selling prices for small lots under 25 tons. Utah, be thinks, is not strong enough to buck against the combine alone.

In conclusion Mr. James says: "Tbe ore producers have advised with good lawyers in Salt Lake City, as well as in several Eastern cities, and I say to all concerned that if tbe lead-ore producers of the intermountain country were fully advised of the wrong being done them and would combine in a determined fight for tbeir rights, they would not only correct this outrage hut remedy others equally as had. Until they do so they will have to submit to a continuation of impositions."

"In the end," Mr. James added as an afterthought, "I suppose the only permauent solution of the problem lies in the capital of the West uniting and establishing its own smelters and handling all its own ore."

The little advance in silver was but temporary. During August it reached 66⅛, which was the highest siuce January of this year. The lowest price was on the 5th of last March —58¾. It is thought that the oriental war and other causes will keep it up to at least the preseut quotatiou for some time to come.

During August there was shipped from San Fraucisco to Hongkong 461,713 Mexican dollars and 4500 sols of Peru; to Shanghai $244,300 in silver hars, and to New York $112,600 in American silver coin.

New York Prices.

Mining Share Market.

SAN FRANCISCO, Sept. 13, 1894.

Last week's stock market closed strong, comparatively, and held its own in the early part of this week. Consolidated Virgina, Ophir and Curry were in demand.

On the Comstock now, as noted elsewhere, the general movement is to the "west country." The Con. Va. is pushing westward on the 1100-foot level; the Gould & Curry, the Union Consolidated, Sierra Nevada and Ophir are also exploring western ground.

In the Bodie the battery assays for the week were $101.36 per ton. There is some talk of a dividend there.

The following illustrates the changes of the week:

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COMBINED SHOE AND GLOVE BUTTONER.—Ida E. Mushette, Oakland, Cal. No. 525,154. Dated August 28, 1894. This device is made of two oppositely projecting buttoners of about equal length; they are fitted to slide upon each other, so that when slid inwardly their outer or working euds are overlapped and protected, and when moved outwardly their hooks are fully exposed and a double-ended buttoner is formed. Thus a single article is provided, combining a hook for buttouing a shoe and a hook for buttoning a glove. The device is compact and neat in form and appearauce; it can be carried in any pocket with entire protection for and from both hooks, and it can be readily exteuded for use.

SULKY CULTIVATOR. — Richard V. Dorsey, assignor to Jensen & Lauritzen, all of Watsonville, Cal. No. 525,096. Aug. 28, 1894. This invention relates to improvements iu that class of machines known as "sulky cultivators," in wbich the cultivator frame is made to rise and fall with reference to the wheels and pole of the machiue. to raise it out of the ground or depress it into the ground. It consists of a wheel axle immovably fixed to the rear of the pole having upwardly projecting lugs or standards near its opposite euds, bell crank levers having the angles fulcrumed to the standards, with one arm projecting rearwardly and the other upwardly, a single bell crank lever fulcrumed in the slot of the pole, with one arm projecting forward and the other downwardly, connecting rods extending from the upwardly projecting arms of each of the first named levers to the downwardly projecting arm of the lever fulcrumed to the pole, links connecting the rear arms of each of the first named levers with the rear portion of the cultivator frame, and a frout arm of the pole lever with the front end of said frame and hand lever wherehy the mechanism is acted to raise aud depress the cultivator. The hand lever is held in place by a segmental rack.

SQUIRREL EXTERMINATOR.—No. 525,127. Aug. 28, 1894. Thomas R. Barney, San Francisco. This invention relates to an apparatus which is especially adapted for the destruction of squirrels, gophers and other burrowing and small vermin. It consists of a chauber or pan designed to hold a combustible or other substauce to produce noxious or suffocating fumes, means for placing the apparatus far into the iuterior of the hole or hurrow, aud supplying an air blast tberetо. This means consists of a chamber having upturned sides and front by which it may he pushed into the hole and a tubular flexible metal haudle which will bend and follow the sinuosities of the hole, one end of this haudle being counected with the rear of the chamber so that it serves to push the chamher into the hole, and a blast apparatus connected with the opposite end of the tubular handle to supply air for combustion and force fumes into underground passages.

FRUIT BASKET AND CRATE. — No. 525,112. Aug. 28, 1894. R. E. Morey, San Francisco. The object of this inveution is to provide a novel meaus for transporting small and perishable fruits. It consists of a basket composed of thin veneers of wood crossing each other at right angles haviug upturned sides, rectaugular strips of wood dovetailed together at the meeting angles to serve as a rim, witb staples fastening the corners, and wire staples wherehy the upper ends of the veneers are fastened to the insides of the rim so that the latter projects around the top of a basket in the form of a ledge hy which to lift the basket. In conjunction with this basket is a crate having vertical walls, with channels or ribs upon which the projecting rims of the haskets are supported so that the baskets are suspended from their upper edges and the hottom and sides are left free from contact, and this allows a perfect circulatiou of air and relief from all pressure which would damage the fruit.

SAFETY ATTACHMENTS FOR GAS BURNERS—No. 524,801. August 21, 1894. Henry Eschweiler, San Francisco. The object of this invention is to provide an attachment for gas burners which will operate automatically to stop the flow of gas if the cock be accideutally opened or the gas extinguished while it is open. It consists of a pillar and burner tip, a pipe by which gas is supplied thereto, a controlling cock, an interposed chamber through which the gas flows, a projectiou from the bottom of the pillar haviug an opening in one side for the admissiou of gas tbrough it to the tip, a two-part liquid containing receptacle horizontally pivoted so as to rotate within the chamher, an eccentric pin projecting from the plug of the cock adapted to form contact with either of the two sides of this receptacle so as to turn one side uppermost when the cock is closed and the other part uppermost when it is opened, whereby the liquid will flow from the uppermost to the lowermost chamber through a small couuecting passage, and a valve is fixed to the part which is uppermost wheu the cock is opeued, in such a position that when the weight of the liquid has been transferred to the other side, the receptacle will he turned aud the valve will close the opening to the burner. This insures the cutting off of the gas supply wbenever tbe weighted receptacle is rotated about its pivots. An expansion bar is fixed in the pillar which is acted upou by the heat when the gas is lighted, and a bent wire haviug one end fixed iu the bottom of the pillar passes over the upper end of this expansiou har, thence downwardly into the chamber below, and has an outwardly turned point which presses against the valve on the rotary receptacle so as to keep it open and allow the gas to euter as long as the expansion bar is elougated by the heat of the gas. If the gas is extinguished the bar will contract and will thus allow the end of the bent wire to draw inwardly and this relieves the valve so that it will close and prevent any more escape of gas.

FILTER.—No. 524,821. Ausust 21, 1894. Herman Eisner, San Francisco, Cal. This invention relates to certain improvements in filters. It consists of a compartmeut filter case baving chambers for the reception of unfiltered water, means for delivering thereto and regulating the supply, with dovices through which the water is passed and filtered, and a reservoir to receive and contain the filtered water after passing the filters, a means by which the unfiltered water chamber aud the surfaces of the filters may be periodically cleaned of any deposit within and upou them. The filtered and unfiltered water chambers are disposed one above the other, with openings made between them and filters removably fixed in the openings. These filters consist of cylindrical chambers having wire, gauze and hair-cloth disks fixed therein, and an interposed packing of pulverized charcoal. The supply pipe has a valve which is controlled by a float in the unfiltered water chamber, so that the rise and fall of the water in this chamber actuates the valve and regulates the supply. A jet tube is so arranged with relation to the disks that when the supply valve is opened a jet of water will be discharged across the surface of the disks to clean them of any deposit which may have lodged upon them.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Iuventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ahlest, largest, best, most convenieut, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 hy its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this ageucy has the best knowledge of patents already issued and of the state of the arts in all lines of inventious most common on this coast.

Patents secured in the United States, Canada, Mexico, all Britisb colonies and provinces, England and other eivilized countries througbout the globe.

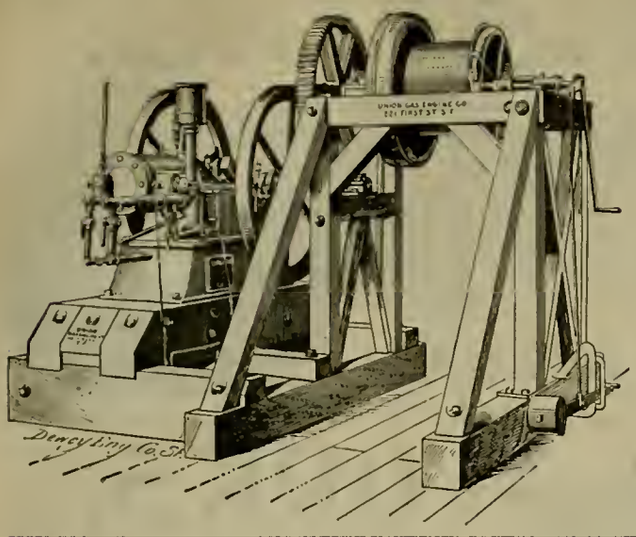
Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

Books on Working Ores.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.



Union Gas Engine Co.

Pioneer Manufacturers

Of Gasoline Engines and Owners of Twenty Patents on Same.

ENGINES FOR MINING PURPOSES A SPECIALTY.

WARNING!

If you are in need of power for mining purposes investigate this engine and take no other. Many so-called gasoline engines are now on the market, which are direct infringements of our patents and it is our intention to bring suit against the various infringers. As the law holds the purchaser, as well as the manufacturer, we would advise parties who have already purchased other gasoline engines to obtain from the sellers of such engines a good and sufficient bond protecting themselves in case damages are obtained against them, as it is not the policy of this company to work a hardship on innocent parties, but the law makes no such provision.

STANDARD ELECTRICAL DICTIONARY.

By Prof. T. O'CONOR SLOANE.

Author of "Arithmetic of Electricity," "Electricity Simplified," Etc.

The "Standard Electrical Dictionary" is what the work purports to be, exhausting the subject of electrical terms, giving each title the clearness of explanation necessary to make the understanding of it complete, without unnecessary elaboration. In this work every electrical word, term or phrase will be found intelligently defined.

The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the every-day electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of the greatest science of the times.

624 Pages. 350 Illustrations.

Handsomely Bound in Cloth, 8vo. PRICE, $3. Extra Super Calendered Paper.

What is said of the STANDARD ELECTRICAL DICTIONARY.

The dictionary gives evidence of a large amount of painstaking work on the part of the author, and possesses features which must be commended. Among these, the author, wherever occasion required it, has furnished the synonyms of terms, and the book is given an additional value by an alphabetical index, which enables it to be consulted for terms both collectively and individually. The work will prove of value to the reader, whether professional or non-professional. The definitions are put tersely and concisely, so that the inquiring reader can carry away a defined, net impression as to what is meant. Any student who will spend his leisure hours over the volume will be amply repaid for his time and trouble. The book is very clearly printed in bold type on good paper, and is well bound.—*N. Y. Electrical Engineer*

SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

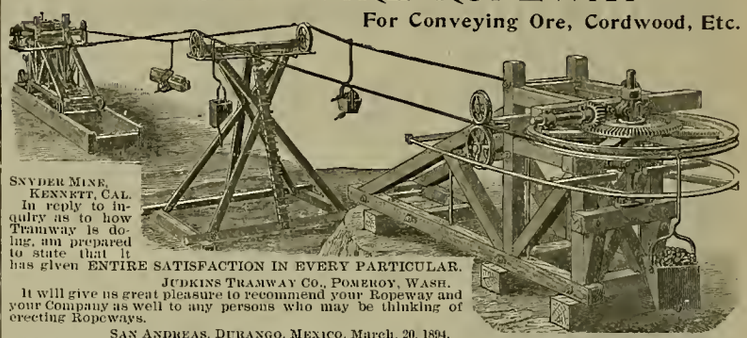
130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

Stamp Mills!

VULCAN WIRE ROPEWAY

For Conveying Ore, Cordwood, Etc.



SNYDER MINE,
KENNETT, CAL.
In reply to inquiry as to how Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR.
JUDKINS TRAMWAY CO., POMEROY, WASH.

It will give us great pleasure to recommend your Ropeway and your Company as well to any persons who may be thinking of erecting Ropeways.

SAN ANDREAS, DURANGO, MEXICO, March, 20, 1894.
I desire by this letter to testify that the Vulcan Wire Ropeway furnished to this Company by your Works, and erected by your engineer, B. McIntire, is of the very best class, and has given us entire satisfaction since its installation.
ANTONIO H. PAREDES, Director S. A. de la S. M. Co.

Vulcan Iron Works,
135-145 Fremont St., San Francisco.

The Blasdel Concentrating Belt Co.

OWING to improved machinery we are now able to sell our NEW IMPROVED CONCENTRATING BELTS for the "Triumph" or Frue Vanners at reduced prices; also our Improved Belts six feet in width.

Practical mill men must see at a glance the advantage of our belts over any other.

First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.

Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.

We manufacture smooth belts with our Improved Flanges to order. Send for references.

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXIX. Number 12. SAN FRANCISCO, SATURDAY, SEPTEMBER 22, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

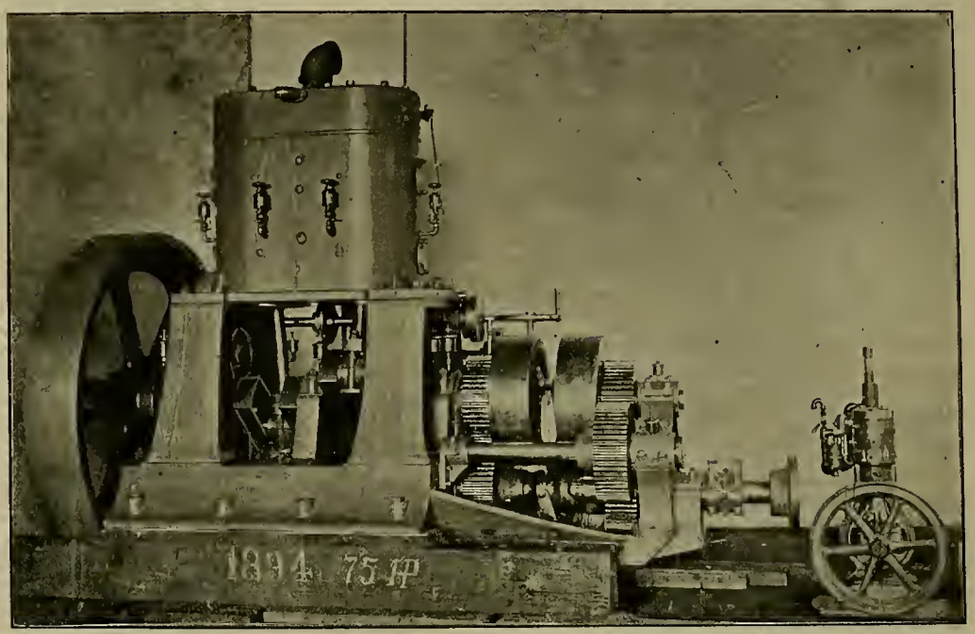
"San Francisco Leading the World."

We take particular pleasure in calling the attention of our readers to the large marine gasoline engine on this page. This engine is claimed by the Union Gas Engine Company, builders, to be the largest marine gasoline engine in the world. It was built on the order of Mr. J. S. Kimball, and is being placed in the schooner "Moro" now lying on the stocks at Alameda point.

The schooner will be launched in three weeks and a trial trip will occur immediately thereafter. The illustration shows the rapid and enormous growth of the gasoline engine in the last few years, the small engine at the right side of the picture being of the type of 1890 and of one H. P. The largest marine engine heretofore built by this company was a 40 H. P., which has been doing good work for nearly a year on board the schooner "Bessie K.," also owned by Mr. Kimball and associates. Of course it goes without saying that it was the satisfactory work performed by the 40 H. P. engine which led to the order for the one of 75 H. P.

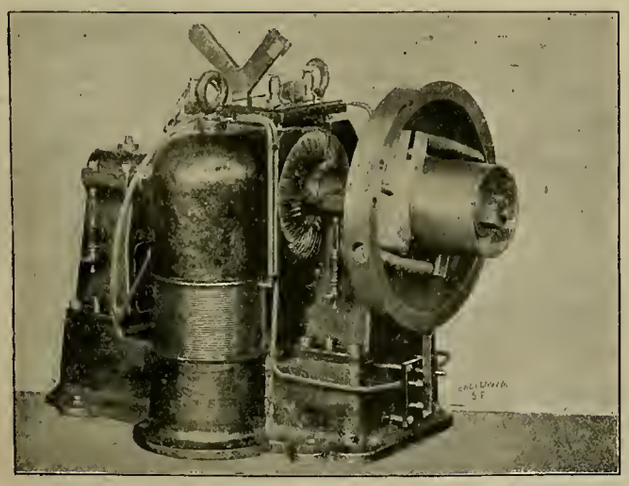
We will not attempt in this article to go into a technical description of the engine, but will say that it weighs about ten tons, stands nine feet high, and will be placed in the schooner just abaft the main mast. The reversing gear is so arranged that in less than three seconds the propeller can be reversed from full speed ahead to full speed astern. There are some twelve or fifteen new mechanical arrangements and devices on this engine, all of which will be patented at once.

San Francisco is the home of the gasoline engine, and it is here that its greatest and most rapid growth has been obtained, but the success which is following the business here has led to the establishment in the East of several large manufacturing concerns, one of which, the Globe Gas Engine Co. of Philadelphia, is building from the Union Gas Engine Co.'s plans and patterns, and under its patents.



LARGE MARINE GAS ENGINE RECENTLY BUILT BY THE UNION GAS ENGINE COMPANY.

HEREWITH is illustrated the latest type of long distance constant current electric motor, manufactured by the Electrical Engineering Co. of this city. There are about fifty of these machines in constant use in the city, engaged in such work as was formerly done by steam and gas engines.



LONG DISTANCE CONSTANT CURRENT ELECTRIC MOTOR.

"NEW PROCESSES" are daily reported from various mining localities, some of them, doubtless, of merit, but only valuable by the showing of results and satisfactory experience. The absurd claims made occasionally by inventors and projectors should not detract from the value of novel or improved processes, but the only measure of judgment is success, and success can only be assured by economical showing in practical results.

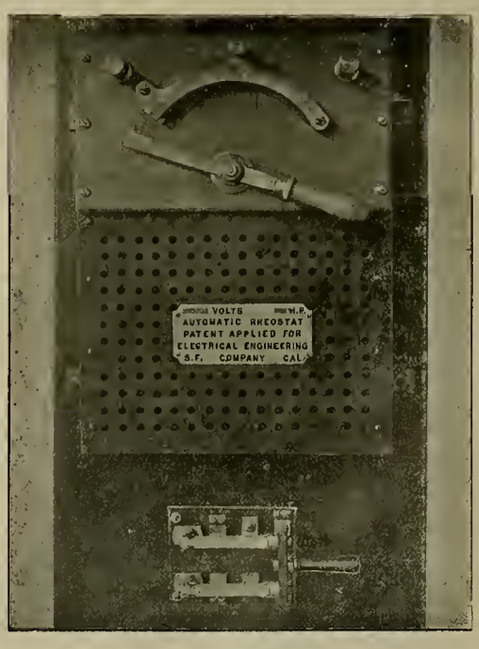
IT is satirically suggested that in view of the increasing output of gold that the yellow metal may be in danger of demonetization. It is not, however, deemed probable that the market value of gold will be greatly affected nor that platinum will be given the preference for coinage purposes for some time yet.

THERE is considerable activity in the sale of gold mine property in the vicinity of Baker City, Or., several cash transactions being reported from there at prices ranging from $5,000 to $50,000. That district seems to be a present favorite with Chicago men, who prefer gold mines to railroad stock as a paying investment.

THE standard silver dollar will celebrate its Centennial on the 15th of next month, the first lot of U. S. silver dollars—1758 in number—having been issued on October 15, 1794. Many millions have been minted since then, and it would have been better for the country every way if more millions had been issued in the last twenty-one years—since the demonetization of silver in '73.

IT has been said of bumble bees that they are biggest when they are born. It is to be hoped that the same cannot truthfully be said of the Gold Horn Mining Company which recently organized in Los Angeles; capital stock, $300,000; amount subscribed, $5.

THE accompanying cut represents the new type of patented rheostat, manufactured and used by the Electrical Engineering Co. of this city in its long distance high potential mining plants. The device is made entirely of non-combustible material, is strong and rigid in every part, and of a very superior quality of workmanship; but the most interesting feature of the device is its means of controlling the electric current so as to protect both itself and the motor operated on the circuit which it controls.



NEW TYPE OF AUTOMATIC RHEOSTAT.

DESPITE indignant protests it has been determined to return the Apache Indians captured with Geronimo to Arizona. Geronimo himself will remain in Alabama, where he is a justice of the peace and a deacon in the church.

THE National Bureau of Steam Engineering, Navy Department, Washington, D. C., has just received a report from Chief Engineer Wilson, looking after the work of the Engineers' Department on board the battleship Oregon, on the contractors' trial of that vessel, held recently. According to the report, the machinery developed 9500 horse power, and the maximum speed obtained was seventeen and a half knots. This is over two knots above her contract speed, which is a good showing for the Union Iron Works. The completion of this fine vessel is contingent upon the arrival of the armor plate, which is a matter of government delay.

ELSEWHERE is printed the official report of the committees in charge of the mining exhibit at the Midwinter Fair. It is a matter of congratulation to the miners and mining interests of the State that the exhibit was a success in every way. The exhibit was large, varied and fairly representative of all sections of the State. It was seen by hundreds of thousands of people, and aided in no small degree in the renewed interest everywhere manifested in California's mines. It was well managed, and now the gentlemen in charge are able to show a receipted bill for every expense incurred, and a cash balance on hand of $1500, which has been turned over to the California Miners' Association.

Of Practical Value.

"The Gas and Petroleum Yielding Formations of the Central Valley of California" is the title of Bulletin No. 3, issued by State Mineralogist Crawford. It contains about 100 pages of practical information on California hydrocarbons, prepared by W. L. Watts, M. E., the result of personal research and observation, and is illustrative of the value of the State Mining Bureau.

It is a compendium of up-to-date information regarding the gas and oil yielding formations in the Sacramento and San Joaquin valleys and the adjacent foothills. The geology and topography of the several districts, the present stage of development, descriptions of the work now being done and suggestions relative thereto are given, supplemented by chemical analyses. In view of the present interest in this portion of California's mineral wealth, the issue of this pamphlet is most valuable and timely. It contains maps and illustrations, and will be furnished free of charge to any one applying for it personally or by letter to the State Mining Bureau, Pioneer Building, San Francisco.

An Australian Mine Report.

Among the many home and foreign mining companies' reports received, that of the Sunlight Gold Mining Co., of West Hillgrove, N. S. W., is noticeable by reason of its minute detail. Every item of expenditure is so elaborately set forth, and the expense account is so subdivided that the precise cost of every movement is shown.

The report, which is for the six months ending June 30, '94, shows that during that period 8237 tons ore had been treated, yielding 3386 ounces gold, worth £11,875, an average of £1 8s 10d per ton. The cost was £1 3s per ton. It is the published minutiæ of this cost account that is noticable. There are ten divisions, which embrace 24 subdivisions, which include 91 separate sources of expenses. The elaborate system of accounts shows that in getting out the ore 5s 8d per ton was paid to miners, 11d to truckers, 6¼d to mullockers, 8¾d to timbermen, 5¼d to drill sharpeners, 5¼d to shift bosses. It cost 8.946d per ton for blasting materials, 4½d per ton for candles, one-tenth of a penny for tallow, 3¾d for timbering, 1½d for tools, three-fourths of a penny for drill steel; nails, screws, rivets and dog spikes, combined, cost one-third of a penny; bar, angle and sheet iron, and shear and square steel cost 1¾d; coal and charcoal cost 1.7d. Separate accounts are kept with every department of development work. In the "tramway" department, for every ton of ore the engine driver got 2¾d, the fireman 1d, the brakeman 2¾d, the hopperman 2¾d, the lander 1¾d. For each ton of ore there was paid for fuel 1¼d, water 1.04d, oil .3 of 1d, packing .12 of 1d, tar .13 of 1d. The fractions are here condensed: in the report from which we quote every little detail is carried out to three decimal places. For instance, in the account marked "Battery" comes the division "Labor," subdivided as follows, the figures in all cases being the cost per ton of the ore extracted, expressed in pence: Engine drivers, 5.917; stone breakers, 5.480; feeders, 6.974; blanket boys, 4.952; amalgamators, 4.769; tailings dam cleaners, 0.778. The "Battery" account is still further subdivided as follows—"Supplies:" Firewood, 18.040; grease, oils, waste and packing, 1.876; lighting materials, 1.021; pump leathers and valves, 0.259; belts and laces, 0.132; stamper heads, 0.433; stamper cams, 0.204; stamper shoes, 2.141; stamper dies, 0.480; screens, 0.933; baize (blanketing), 0.778; quicksilver, 1.773; chemicals, etc., 0.126; shovels and tools, 0.199; spur and pinion wheels, 1.413.

The more minute and intricate subdivisions of the above are omitted.

Several pages of these extraordinary details are given. It is interesting to observe that while for every ton mined 8s 10½d were paid to the miners, but 3 pence were paid for office salaries; and that the "law expenses" were less than one-half of one penny per ton. "Rent and royalty" cost over 3 shillings per ton; while, on the other hand, "telegrams and postage" cost less than one-eighth of a penny for every ton of ore, and the "carriage of bullion" but 1¾d. Row after row of the most elaborately prepared tables appear, making it evident that if office salaries only aggregated 3d per ton, skilled accountants can be secured for very low wages in the vicinity of West Hillgrove.

The report closes with a page proposition and argument on the part of the directors notifying the employes that even still closer figuring would be required to make matters satisfactory to the home office, and that a sliding scale of wages would be at once put in force, based on a daily yield of 55 tons of "stone," and that each one would be paid so much or so little per ton of output. The usual array of thousands of figures follow on the next page showing that on that basis the daily earnings of the men would run from 5s 4d to 7s 6d.

If every department of business in Australia is as closely figured in all its multifarious details as the mining industry, the owners will have little trouble in determining where the leak, if any, exists.

THE annual convention of the California State Miners' Association for 1894 will begin its sessions in this city on Monday, November 19th. Matters of mutual importance to the mining interests of the State are pending, and it is in order that representative delegations appear from every part of the State.

Another Bonanza.

If half what is asserted is true, Nevada has a new bonanza in the discovery of gold quartz "that will assay $80,000 to the ton." The strike was made by Messrs. Zirn and Schulz at Pine Nut, near Carson. The Carson *Tribune* says:

This wonderful strike will no doubt attract mining men and capitalists to Pine Nut from all sections of the coast, as it is proof that a gold deposit of mammoth proportions exists at Pine Nut. The strike means renewed life for Carson and all western Nevada. It makes everybody feel good, and already property in Carson has gone up twenty-five per cent.

At a depth of seventy-five feet Zirn is reported to have run into an ore body that appears to be half gold. In two hours he took out $600 in fine gold. The *Enterprise* says:

The vein where the fabulous gold was found is the westerly of three veins which are clearly defined by croppings. Two of these veins have already been opened up, namely the eastern and the western veins. A shaft has also been sunk on a stringer of the middle vein, which resulted in finding ore assaying $10. The westerly vein, upon which the Zirn-Schulz claim is located, has already been shown to have a length of 6000 feet. The loose surface dirt, in a little gully 200 feet south from the spot where the Zirn-Schulz gold is located, pans about $30 at the point where the gully crosses the vein and gradually depreciates in value, going, 200 feet below, about $15. The rich vein is decomposed brown iron and quartz containing entirely free gold, with occasionally small quantities of native silver.

A large proportion of the Comstock ore gave 46 per cent of its value in gold. Should this new bonanza have the dimensions claimed, it would exceed the old one in richness. It would be a fitting sequence were the State so greatly depressed by the demonetization of its chief mineral product to be able, like Colorado, to produce the yellow metal in such quantities as to make up for the depreciation in silver, and, by increasing the world's stock of gold, aid in dispelling the disparity that at present exists.

Oil at Los Angeles.

Los Angeles is fast adopting crude petroleum for fuel, which there aids in solving the coal problem. It sells at $1.25 a barrel, a reduction of nearly 50 per cent, and it is expected to go lower. It is now proposed to establish a refinery. Oil is ordinarily found at an average depth of 300 feet; at the depth of 600 feet a better stratum of shale is reached, and sanguine Los Angelenos expect to shortly show natural gas within the city limits.

At the last meeting of the mining committee of the Los Angeles Chamber of Commerce the following was passed:

Whereas, A great and increasing interest is being manifested in the petroleum and other mineral development of this portion of the State, and we learn that the State Mineralogical Bureau, through its agent in the field, has investigated and reported upon the oil and gas-bearing formation upon the eastern slopes of the Coast Range, thus imparting very valuable information to the great assistance of capitalists and investors, and consequent increase in production; and

Whereas, It appears very desirable that similar investigation should be made, particularly of the oil and gas-bearing formation on this side of the Coast Range, with direct reference to this locality and the immediate vicinity of Los Angeles, for the reason that larger investments have been made upon this side of the Coast Range in the minerals referred to, which should certainly entitle us to due consideration; therefore, be it

Resolved, That this Chamber present this whole matter to the attention of the State Mineralogical Bureau of San Francisco, with a request that such action be taken by it in the near future, including active investigations in the field, as shall constitute a proper presentation of the whole subject, with maps, charts and such other aids as are necessary to define the mineral belts and give a clear conception of the whole subject.

AT the recent Populist Convention in Pueblo, Col., one of the speakers, discoursing upon finance, is reported to have said:

I have been at Creede, and looking down the shafts of the dark mines, I am more than ever in favor of the issuance of greenbacks by the Government. Men should be released from delving in the ground.

The statement that this remark "was greeted with deafening applause" would indicate that that convention was not an advocate of any kind of metal money. Just why looking down a dark shaft should so strongly impress that particular delegate with the superiority of a greenback issue is not quite clear. Even with advocates of rag money, however, the time has not yet come when men will be released from the ancient and honorable occupation of "delving in the ground."

THIS week the Alaska-Mexican Gold Mining Co. sent down a $20,300 shipment, the result of crushing 6434 tons ore—an average of $3.16 per ton. The fact that such low-grade ore can be worked at a profit illustrates the advance in mechanical appliances. It must also be added that the circumstances and surrouudings of that mine, like its neighbor—the Alaska-Treadwell—are peculiarly conducive to economical working.

Concentrates.

THE Oroville *Register* says the Shakespeare mine at Forbestown is still idle.

THE *Era* reports resumption of work at the Mt. Hope mine, Forbestown, Cal.

ACCORDING to the *Journal*, Cripple Creek, Col., will produce $1,000,000 in gold this month.

SAN FRANCISCO men have bought the Solano mine, Nevada Co., and will put on machinery.

THE gold at the new Pine Nut, Nev., discoveries assays $18.85 per ounce at the Carson mint.

A CONCENTRATOR is being placed at the Shenandoah mine, Plumas Co., and the mill started up.

A DIVIDEND of twenty cents per share will be paid by the Homestake Mining Co., next Tuesday.

THE total mineral product of the Black Hills from 1881 to 1893 inclusive is $42,845,277, nearly all gold.

THE Jackson Mining Company, Eureka district, Nev., paid a five-cent per share dividend last Wednesday.

EASTERN men will build a 20-stamp mill on the Ohio and Oro-fiamme mines in Hassayampa district, Arizona.

THE Virtue mine, Baker City, Or., has shipped a $16,000 gold brick, the result of one month's run, to this city.

IT is said that $100,000 has been refused for the Lost Horse mine, north of Indio, Cal. This mine was located last January.

THE Lincoln mill, at Silver City, Idaho, has started up. It has ten stamps, which are expected to crush thirty tons per day.

RICHARD WILLOUGHBY has sold his mine on Admiralty island, near Juneau, Alaska, for $100,000, to San Francisco men.

THE Osborn mine at Websterville, Placer Co., has been sold at administrator's sale to O. L. Barton, of Rocklin, for $10,500.

A CURIOUS fact about the ore from the Slocan country is that the higher the percentage of lead the higher the cost per ton for treatment.

THE Nogales, Arizona, *Vidette* asserts that the gilt-edged accounts of Thomasville, Pinal county, are not in accordance with the facts.

THE Gold Mining and Milling Company has been organized in this city. Capital stock, $1,000,000, of which $525,000 has been subscribed.

THE *Eagle* says: More gold has been shipped to the United States mints from northern Grant county (Or.) this year than for many years.

THE Beckwith mine on Rock creek, sixteen miles from Baker City, Or., has been sold to Messrs. Coruth & McMillan, of Texas, for $30,000, cash.

EXCELLENT reports are received from the Eagle mine near Reno, Nev. At a depth of 160 feet, the ore vein gives samples that assay $3000 in gold.

EX-GOVERNOR BLAISDELL of Nevada has bought the Bigelow mine, Sierra Co., which paid so well two years ago under the lease of the Morrison Bros.

ONE HUNDRED men are employed at the Gold Bank mill and mine at Forbestown, Cal. An eight-foot tunnel will be driven 1000 feet lower down the hill.

GEORGE J. GOODHUE, of the Kootenay Hydraulic Co., has received $60,000 for the use of his company and will use it in putting in a pumping plant.

THERE was a general resumption of active operations this week at the E & E mine, at Cracker Creek, Or. A furnace has been built for roasting the ores.

ABOUT 200 men are employed in the quartz mines in and around Sierra City, and the prospect is very favorable before long of a considerable increase in this working force.

GOLD SAVING MACHINES are being successfully operated on the north fork of the John Day river, Grant county, Or. Good hard times wages are being made by the miners.

PROMINENT Utah Mormons have formed "the Utah Co.," with $10,000,000 capital, and intend, among other things, to extend the Salt Lake & Los Angeles road to the coast.

"SHALL the State capital be changed from Helena to Anaconda" is the question now agitating Montana, and replied to by most of the Montana press to hand in the affirmative.

THE Bartlett process is pronounced a success in handling the low-grade gold ores of the Cripple Creek, Col., district. It is credited with saving ninety-two per cent of the assay value.

CAPTAIN MOORE'S 100-ton concentrator at Silver Creek, B. C., will be in operation this fall. It is the first works of the kind erected in the Slocan, and the machinery was admitted free of duty.

THE Bodie on the 10th inst. shipped $24,600.37—the straining and blanket cleaning of twelve days' run. The *Miner* thinks if the stock was selling at its full value, it would be quoted at $20 and over.

FOR its exhibition at the Midwinter Fair Nevada county contributed $2,378.25. The committee have filed their final report, turning over $259.50, which has been placed in the county treasury.

A CLEANUP at the Osborn Hill mine, Grass Valley, on the 18th, showed a return of $7280 for a twelve-days' run of the 20-stamp mill, 10 stamps dropping on first-grade and 10 on second-grade ore.

IN the Alma district, Park county, Col., a single ten-stamp mill has produced $20,000 in gold during the past year. The supply of ore has not been regular, owing to want of system in working the mines.

OWING to the cheapness of Mexican silver, remarks an exchange, as compared to bullion, more than one man is remarking that it might be worth while now to buy up Mexican silver and hold it for a raise.

THE Kiagman, Arizona, *Miner* hears that Bucky O'Neill has sold his group of Big Bug onyx mines to New York capitalists for $250,000. If so, "Bucky" ought to be able to make political pots boil lively in the Territory.

THE Robbins-Elkhorn mine, Baker City, Or., reports a cleanup of $2535, the result of an eighteen-days' run. Three carloads of concentrates were shipped to the Everett Smelting Works last Saturday.

IT MAY be a little harsh in statement, but there is a mighty truth in the command of the Anaconda *Standard*: "Do one of two things, every man who reads this page—have faith in Montana or quit the State!"

THE Morning Star mine at Iowa Hill is being supplied with a new dynamo that will furnish lights of twenty-candle power. This will make the second one in place, as they already have one with ten-candle power for lighting the mine.

DURING July, 57,500 ounces gold were recovered from tailings in the Transvaal, a decrease of 500 ounces from the returns of the preceding month. The aggregate from that source for the seven months ending July 31st is 388,950 ounces.

AT the Gold Bronze mine, Vanderbilt, Cal., there are twenty-five men at work. A vein of eighteen inches to two feet in width has been uncovered, furnishing ore that yields all the way from $10 to $100 a ton. Sinking continues on the main shaft.

THE Lamarque Mining Company has incorporated at Grass Valley. There are 100,000 shares of the par value of $1. The incorporators are S. C. Thompson, A. Maltman, E. L. Foster, J. A. McClure and James F. Paul. The *Union* says machinery will be put in right away.

THERE was a meeting of the California Debris Commission last Monday. No hydraulic permits were granted. Applications are pending from A. Morse, owner of the Nugginsville mine near Downieville, and John R. Jones, owner of the Waukshaw mine at Relief Hill, Nevada county.

IN a dispute about the amount due A. R. Blake by A. Ball, for whom Blake had been doing prospecting work, Ball shot Blake through the heart with a Winchester at his (Ball's) home in the Salmon river country, Siskiyou Co., last Saturday. Upon preliminary examination Ball was acquitted on grounds of self-defense.

SECRETARY CARLISLE has issued a circular concerning the coinage of silver dollars under this administration, the coinage being under the unrepealed portion of the Sherman act. It shows that since the present administration took control, 1,957,223 standard silver dollars have been coined, of which 520,069 have been seigniorage.

THE Ashland, Or., *Record* says Horn & Co.'s Gold Note river mine on the Klamath is taking out rich pay gravel and will be on bedrock this week. The American Bar is also paying well, and will be in bedrock this week. They took out a five-ounce nugget the other day. The latter company have their wheel located on a suspension bridge.

THE old North Fork mine at Forest City has been reopened by a company that owns 1200 acres on the old Bald Mountain channel, besides timber lands and water rights. It is thought that a tunnel 2800 feet in length will bring pay. The channel they are running for is said to be very rich, the old Bald Mountain Company having taken out hundreds of thousands of dollars.

THE Rachael mine, Emma district, Eastern Oregon, has been bought by Messrs. Wallace & Wheeler, of Chicago, for $4150. There is an eight-inch vein of free gold ore in sight, with a 52-foot shaft and a tunnel 30 feet long. The purchasers are going to work at once and will put up a mill. The mine is in the same belt as the Virtue, which is turning out bullion in paying quantities.

THE owners of the Marion group of mines, Mercur district, Utah, have incorporated with half a million capital, and will enlarge their mill. The capacity of the plant will be doubled. The process of retorting the zinc precipitates, as applied at the Marion mill, has proved a great success, and a high percentage of the quicksilver contained in the ore is saved by this means, for which a ready market is found.

THE development of the Red Cloud mine in Mariposa is so satisfactory on the 700-foot level that the management has decided to sink another 100 feet. On the 600-foot level a disturbance occurred that threw the pay chute off its regular course, but the work now done on the 700-foot level justifies the belief that as depth is attained it will resume place among the gold producers of the Pacific coast.

T. C., J. W. AND S. T. STERRETT have brought suit against G. S. Montgomery, C. N. Crittenton, J. W. Martin, P. Kyle, et al., for $200,000 damages, the cancelation of certain contracts and the repossession of the Sterrett mine in Placer county, said to be worth $250,000. About two years ago plaintiffs made a transfer of their property under certain conditions, and now claim that they were defrauded.

THE Cleveland mine, located near Springdale, Wash., has been sold to parties from the Slocan country, the consideration being $150,000. An assay is as follows: Forty per cent lead, forty ounces of silver, fifteen per cent zinc and a trace of gold. Springdale, on the Spokane & Northern, will be the shipping point. The mine will be worked at once, as part of the purchasing contract calls for a weekly shipment of 600 tons.

A VANCOUVER, B. C., dispatch says: Though the brush fires have been very extensive in British Columbia, the damage has been comparatively small and the miners are looking forward to one advantage which, it is said, will result from the fires. The moss and grass will be burned away from the face of the rocks, and when the rain washes the ashes off the rocks will be bare, and prospectors will have a better chance to discover ore veins.

AT White Oaks, New Mexico, two merchants, named Sewartz and Rosenthal, stole a gold brick, weighing $18\frac{3}{4}$ pounds, worth something over $4000. They had to cross a desert country a hundred miles to a railroad. They were suspected and could not get away with their stealings. Detectives were put on their track, says *Bullion*, and evidence collected sufficient to warrant their arrest. They confessed the theft and returned the brick, which belonged to the South Homestake mine.

THE Cripple Creek, Col., *Crusher* says: "The Pueblo and Denver smelters are very hungry for the Cripple Creek siliceous gold ores, and their buyers now make more trips into this district than into any other in the State. The reason for this is plain, as there is no fluctuation in gold values and the smelters take no risks now on silver tonnages. But the smelting charges on Cripple Creek ores are very high and should be reduced at once. Concerted action on the part of the heavy shippers here would lead to speedy reduction. There is no reason in smelters charging $14 per ton on gold ores which cost only about $7 per ton to smelt, and there is a clean margin on the gold up to the difference between $20.66 per ounce which the smelters receive, and the price they pay, which will not average as high as $19.50 per ounce. And the moisture deductions made on ore from this dry camp amounts to virtual robbery.

THE owners of the Golden Fleece mine in Hillsdale county, near Lake City, Col., recently refused $1,500,000 cash for that property, offered by a New York and London syndicate. The Denver *Mining Industry* thinks it requires a good deal of both faith and nerve to refuse so much money in hand for a mine. So it does, but there are several gold mines in this State for any one of which the owners would refuse to accept that sum. Four times that amount was recently offered for the Utica mine, Angels, Cal., and refused.

E. REED, the general manager of the Bobtail mine, near Central City, Col., was killed last week. He was examining the mine, accompanied by a party of mining experts, and with two other men got into the bucket to go to the surface. The collar of the shaft was reached, but when the engineer attempted to stop the cage the brake failed to work and it continued to the sheave, where the bucket was overturned and Mr. Reed fell to the bottom of the shaft, a distance of 500 feet, and was instantly killed. The others fell on the curbing and escaped.

FOUR HUNDRED AND FIFTY men are now employed by the United Verde Copper Company, Jerome, Arizona, and it is reported that the force will soon be doubled. A correspondent of the Prescott *Courier* says that this can easily be done, as the mountain upon which the mines are located is one solid body of mineral, varying to some extent in richness, but the whole can be worked at a profit. Improvements and additions are continually being made with a view to increase the output of the mines, the latest being a converter which will convert the matte into copper.

THE *Enterprise* reports excitement over the strike just made in the Zira-Schultz mine at Pine Nut, Nev. A piece of rock about the size of an egg weighs just twelve ounces, and is variously estimated to contain from one to two ounces of rich gold worth $19 per ounce. The rock is decomposed quartz mixed with feldspar and black manganese. Gold sticks out of the rock and runs through it in all directions. It would be easy with a pair of pinchers to pull out dollars' worth of gold. Some of the gold sticks out a quarter of an inch, and pieces in sight were worth two or three dollars.

THE Morning Star at Gold Flat, Cal., is favorably spoken of by the local papers, which say that all needed to make a good mine is development, which entails more money than the present owners have. An incline shaft has been sunk to a depth of eighty-seven feet, and the ledge in the bottom is from ten to fourteen inches wide. The quartz is heavily sulphureted and shows free gold. Crushings made have paid from $25 to over $60 per ton, not including the sulphurets. An assay of the rock made some time ago showed it to contain $226.36 per ton in gold and five ounces of silver.

STRAINED relations between the Grass Valley miners' union and the management of the Osbora Hill Mining Co. resulted last Wednesday in a large delegation from the union driving the superintendent out of town. The chief difference appears to be regarding the number of hours that shall constitute a day's shift. The mine management ask that it shall be ten hours. It has been the custom in Grass Valley to work nine and a half hours. There will be a meeting of the mine management and the executive committee of the miners' union to-day, at which it is expected an amicable agreement can be reached.

THE mill of the Butte Saddle Company near Downieville is completed. Ten stamps will be run. There are 6000 feet of tramway, requiring 24,000 feet of wire. Eighteen men are employed. An upraise is being made for air. The machinery will be propelled by water power. If water becomes scarce an electric plant will be obtained. The two pay chutes are two to ten feet wide, ore averaging $8 to $10 a ton. The wagon road to the mill is half a mile above Sierra City, and thence by trail a mile and a half to the mine, 2000 feet above the Sierra Buttes ledge. The rock formation is similar to that of the Sierra Buttes.

A MINER from Silver City, Idaho, tells the Wood River, Idaho, *Times*, that everything there is very high. Cordwood is $10 to $15 per cord, and it sometimes goes to $20 in winter, as when brought in on "jacks," eight sticks being a load that is thus brought 18 or 20 miles from the timber. Coal is $30 to $40 per ton. It costs a cent a pound to haul it from the railway at Nampa or Caldwell. Rents are also high, and, the *Times* thinks, with high rents, high freights and high prices of everything, a miner at Silver City is not nearly as well paid at $3.50 as he would be in the Wood River country at $2.50 per day.

MESSRS. RUMMEL AND PARSLEY recently found a rich pocket of gold quartz on Ash creek, a tributary of Klamath river, about eight miles below Hornbrook, from which they cleaned up $1500 with a hand mortar in one week. A miner named Reeder has mortared out nearly $10,000 during the past eighteen months from a small quartz ledge, which he has located just across the river from Ash creek. He calls his claim "Fool's Paradise." About a year and a half ago he struck the first pocket and took out $4000. Since then he has found bunches which yielded as follows: One each of $150, $300, $3200, $1790, the last amount being cleaned up by himself and another man in eight days in August. The gold is found in kidneys, or pockets, lying between the quartz and porphyry.

Personal.

GEO. BERLENER is back from Alaska, where he has been expertising mines.

T. SIMMONDS is now superintendent of the W. Y. O. D. mine at Grass Valley.

C. E. GRUNSKY has received the merited compliment of a non-partisan nomination for Superintendent of Streets for this city.

Obituary.

THOS. CAHILL, the well-known assayer and mining expert, died at Kingston, N. M., last Tuesday, aged 65 years.

The Murphy Gold Process.

The following on the Murphy gold process is prepared by J. G. Murphy, its inventor:

Is a gold mine valuable? The question involves a knowledge of the values of the ore per ton and the cost of the treatment. The cost of treatment depends upon the character of the ore. The common operations for the extraction of gold are milling and smelting. The cost of milling per ton in a mill of say forty stamps, will not exceed $1.25 per ton (a high estimate). The charge for smelting is $15 to $20. It is apparent at once that ores which would not be commercially profitable for smelting would pay handsomely if milling were possible. In general, milling ore would not pay for the cost of smelting unless it was exceptionally rich. Suppose an ore to be worth $8 per ton, but is, nevertheless, free milling, an exceptionally high saving by the milling process as now conducted would be seventy-five per cent. Seventy-five per cent of $80 equal $60; less $1.25, cost of milling, equal $58.75. When the ore is sold to smelting companies they usually pay for ninety-five per cent of the assay value of the ore and deduct $15 to $20 per ton for treatment. Now, ninety-five per cent of $80, $70; less $15 or $20, cost of treatment, $61, or $56 net. In such a case as this it will be seen that there is but little choice between milling and smelting, as the increased saving by the latter method balances the difference in the cost of treatment. But the majority of gold mines will not yield ore of sufficient richness to pay the smelting charge alone. We often hear stories of mines which are said to yield ore to the value of $200 and more per ton. Samples can be obtained from any gold mine which will yield by assay $1000 to absolute gold approximating several hundred thousand dollars per ton, but on a commercial scale by carload lots there are but a small percentage of the mines that will yield ore of the average value of $10 per ton, but this value will not pay the smelting charges. In a majority of mines from which the ore is shipped to the smelters careful selection is needed, and often not more than ten per cent of the output can be shipped with profit. Of the total gold production of the world, more than ninety per cent is the product of mill and placer operations.

We now pass to the question of what constitutes a free-milling gold ore. The answer to this is by no means easy. In the usual acceptance of the term, it is an ore which will yield a sufficient percentage to the milling process to make the operation commercially profitable. Rock cannot be properly called an ore unless by metallurgical treatment it will yield a profit; hence we see that rock which will yield $20 per ton, but not free milling, cannot be properly called an ore, while a ten-foot vein of $8 ore (free milling) would be very valuable.

Is the product of a mine in which gold occurs in the native state correctly termed free milling in all cases? Let us examine this question with care. The stamp mill is the machine employed for the reduction of free-milling gold ores. Briefly, it consists of a stem tappet, head and shoe, weight 650 to 1200 pounds: the latter weight now in use in the Black Hills, Dakota. This weight is lifted by the cam, which is attached to the cam shaft, to a height of eight to fourteen inches, the latter drop being used in the Rigby mill, so called. The number of drops is fifty-six to ninety per minute, the smaller number of drops corresponding to the higher lift. This weight falls in a mortar directly on top of a die of the same diameter as the shoe. This die will be on an average four and one-half to five inches above the bottom of the mortar; the ore is fed into the mortar in modern practice by a self-feeder, and is crushed between the shoes and dies.

A quantity of mercury is fed directly into the mortar, varying in quantity with the richness of the ore. As the ore is pulverized the gold is liberated, which, falling to the bottom of the mortar, comes in contact with the mercury and is amalgamated. The amalgam so formed is saved in battery and outer plates of copper, the surfaces of which are amalgamated. We will not discuss this subject in detail, as we are dealing with principles only.

A current of water passes through the mortar, which is the power that discharges the crushed ore from the mortar. The discharge is through screens of forty mesh (1600 spaces per square inch). The quantity of water used is twelve miners' inches, 144 gallons per minute for a mill of sixty stamps; or one miners' inch, twelve gallons per minute, per section of five stamps. It will be seen that the capacity of the mills depends upon the rapidity of discharge. The attempt to use sixty-mesh screens has been made. This was found impracticable, because the capacity of the mill is greatly reduced and the screens clog and break from pressure. Of all the machines used in the metallurgy of gold, the stamp mill plays by far the most important part, consequently we should examine it with care.

We see that it requires a large quantity of water; that a forty-mesh screen is the finest that can be used economically; that the gold, when liberated, must be amalgamated and caught on copper plates. We have stated that in no case would the stamp mill save more than seventy to eighty per cent of the total gold value. Let us seek the cause. The particles of which all rock is composed vary greatly in size. This is especially true of the particles of gold contained in any free-milling ore. The coarse gold is, as a rule, saved in a well-conducted stamp mill operation. The fine, however, cannot be saved by this process. The cause of the loss has been assigned to the flowing away of fine gold in the current of water passing through the mill. I believe this to be true to some extent, but only the cause of a fractional part. The percentage of coarse and fine gold contained in ore is variable in different mines and different sections. Some mines, as the Gloster, Southern Cross, Red Lion, Broadway, etc., contain forty to eighty per cent, often more, of the total value of the ore in the form of flour gold. These mines are rich in chemical value; commercially, however, the Gloster mill will not yield more than fifty to sixty per cent to the stamp mill, the Southern Cross and Red Lion twenty-five to thirty per cent, the Broadway forty per cent. For this reason, these mines and others have not been profitably and properly operated. The ores of these mines are of good grade for a milling operation, but not sufficiently rich for smelting. All the ores of the Gibbonville (Idaho) district fall under this head.

Among the rich and famous sulphuret mines may be mentioned the Moose and Dolly Varden, situated on Moose Hill, near Alma, Col.; the Gregory and Bobtail mines, near Black Hawk, Col. These mines produced millions in gold ore, all of which was smelted in the establishments of Professor Hill, one of which was located at Alma and the other at Black Hawk. The ore was very rich, and in addition to the mining, smelting and shipping charges, yielded the mine owners good profits. The gold in these mines was associated with copper pyrites and peacock copper bornite. I saw another mine equally and even more famous than either of those mentioned above, in which existed large chambers of mixed sulphuret, iron pyrites, copper pyrites, magnetic pyrites, and peacock copper, all rich in gold and treated by the stamp mill. This is the Cable gold mine, of Phillipsburg, Mont., owned by J. C. Savery, of Des Moines, Iowa. The writer made a detailed examination of that mine nine years ago. The mine was equipped with a forty-stamp mill. The gangue of the ore was chiefly limestone, in which occurred the large chambers of the sulphurets mentioned. It astonished me to see this ore all put through the stamp mill, and I even suggested to Mr. Savery that he was sustaining a heavy loss. He called my attention to the fact that he had an assay office, and invited me to determine the loss. My astonishment can be imagined when I found that the percentage of saving in the sulphuret was equal to that in the limestone. Investigation of this statement is invited. This absolute contradiction, not of statement, but, in fact, of all that had been written on the subject, caused me to examine all of my personal experience, and to consult others. The result was that more than eight years ago I reached a conclusion, which was announced recently in pamphlet form almost simultaneously by chemists of Boston and San Francisco, viz., that gold in pyrites is mostly, if not entirely, in the free state. The chemists who wrote the pamphlets announced the existence of gold in iron pyrites (their investigation does not appear to have extended further) in three forms —free, enveloped mechanically, and chemically combined. The latter condition is said to be most rare. I doubt if the latter condition exists at all, and in the absence of proof, which is not furnished in the pamphlets, I adhere to my opinion. Usually the size of a particle of iron pyrites or any other sulphuret contained in an ore is small, so small, indeed, that they will readily pass through a forty-mesh screen, the size of screen used in a stamp mill. If gold is contained in such pyrites the stamp mill would not save it, as it would pass through the screen unaltered.

Let us now think over the preceding matter carefully, and then see if we can decide the cause of the loss of flour gold, and why the gold in pyrites is usually lost in a milling process. Is the heavy loss due to the flowing away of flour gold by the current of water passing through the mortar, or is it due to the fact that the rock is not broken sufficiently fine to free the gold from the gangue? The great percentage of pyrites found exists in small particles. If pulverized sufficiently fine, can any contained gold be amalgamated? We have now reached a proper point for discussion of the Murphy gold process.

This process may be considered worthy of consideration from a single fact—viz., that investigation is asked. The designer will be glad to have errors pointed out and improvements suggested. This process, designed by myself for the Hartford Syndicate (Limited), comprehends the union of several well known machines. If any of these can be beaten for its special department, I will be glad to know it and give the substitute its proper place.

The essential features of the Murphy gold process consist of pulverizing to a fine state of division, and even to an impalpable powder if the fineness of the gold demands it; then the formation of a pulp of the consistency of a thin paste in the well-known combination pan, to which we give preference, at the end of which are the usual settlers, also so well known that space for description would be wasted here. The effect of the arrangement of these machines would be—

1.—That no matter how fine the state of division in which the gold exists in the ore may be, it will be liberated from the gangue and rendered fit for amalgamation.

2.—That there will be no current of water to float the flour gold off.

3.—That the process can be employed in sections where there is not sufficient water to run the stamp mill.

4.—That at all stages the process is completely under the control of the operator, so that the batch does not need to pass from the pans to the settlers.

As to this process and how cheaply it will treat gold ores, the general description which follows and a study of the plans will be an indication. The mill is entirely automatic, and but a single man at the rock breaker is needed for a plant of fifty tons or more.

The ore as it comes from the mine is dumped on grizzlies. The fine material passes through, and falls to the bin; the coarse lumps fall on the crusher floors directly in front of the crusher's jaws, which should be so set that they are on a level with the floor, thus avoiding lifting. From the crusher bin, which is inclined, the ore passes directly to a set of rolls, where it is crushed to a thirty or forty-mesh screen (900 to 1600 spaces per square inch). After being crushed, the ore is elevated, and that which is not fine enough to pass through the screen goes back to the rolls; that which is fine enough passes through the screen into a bin which communicates with the continuous feed and discharge pulverizing cylinder. This continuous feed and discharge pulverizing cylinder is the machine to which special attention is called, and to the operation of which the success of the process is due. There are 3000 of these cylinders (old style) now in use pulverizing flint and feldspar for use in the manufacture of porcelain and pottery. These machines can be seen in operation at Brandywine Heights, Del., South Glastonbury, Conn., etc. The fineness to which it is necessary to pulverize these materials for use is 200 mesh for porcelain and 250 mesh for glazed ware (40,000 to 62,500 spaces per square inch). This machine is patented and known as the Alsing cylinder, manufactured by the J. R. Alsing Co., 60 New street, New York. For the amalgamation of gold it is not thought that it will be necessary to pulverize to 200 or 250 mesh. The ore, pulverized as finely as may be necessary in the cylinder, is conveyed by the discharge pipe to a bin, the bottom of which is arranged in the form of a hopper to feed directly into the pan. The remainder of the operation is exactly that used in a silver mill, and will not be discussed, as the operation is well known.

From the preceding description it can be seen that the operation is entirely automatic.

The cost of treatment, as has been shown, is of primary importance for gold ores that will not bear the cost of smelting charges. The cost of crushing by the rock breaker and rolls will not exceed forty cents per ton. The cost of pulverizing to 200 mesh will not exceed $1 per ton when the ore is first put to a thirty or forty-mesh screen. Taking the total cost at $2 per ton for crushing, amalgamation and retorting, it is seen that by this process we can treat the ore from a large number of mines which by the ordinary process could not be made to pay until the amalgamation is completely determined by the usual method of panning samples.

5.—That ninety to ninety-five per cent of the gold contained in any free-milling gold ore can be saved. This may and will likely be questioned. Apply the following test for confirmation: Take any free-milling gold ore, pulverize to 125 to 200 mesh (generally 100 will do), take a casserole or other proper vessel, into which put the pulverized ore, wet to the consistency of a thin paste, take a common egg beater, and after introducing the proper amount of mercury agitate the mass for an hour. The result will show a saving of ninety per cent. This is not so perfect as the combination pan, however. The work of the pan is as follows: The muller slaps the pulp out to the periphery, the spiders slap it back, thus making two lateral forces. The revolution of the muller creates a vortex of about six inches in diameter, in and out of which the material constantly passes. We thus have three forces to effect the perfect contact of the mercury with the gold; and, therefore, say that the Murphy gold process will save ninety per cent, even ninety-five per cent, of the gold contained in any ore, unless it contains elements which will foul, contaminate or consume mercury, such as native copper and the ores of lead. In the Broadway mine there was a deleterious element in the gangue of the ore which operated against close saving. Professor Clayton was called upon to see if he could not devise some means to save more than forty per cent of the value contained in that ore. He spent considerable time in the endeavor to effect that result, but without success. The Professor informed the writer that the Broadway ore contained considerable talc in its gangue, which acted as a grease and prevented the union of the gold and mercury. I will not discuss this, but in the Murphy gold process the existence of talc as a part of the gangue would in no way affect the amalgamation. The whole thing is in the pan,

and the forces mentioned are sure to bring about contact of the gold and mercury, which is all that is needed. It makes no difference whether the gold is obtained in iron pyrites, copper pyrites, peacock copper, etc.; it will be collected and saved by this process.

Dividend Paying Mines.

Mines operated in the United States paid $612,250 in dividends during the month of August, says the *Rocky Mountain News*, making the total of dividends paid thus far in 1894 equal to $4,610,134, a figure which challenges comparison from any other industry—the sugar trust excepted—according to the capital actually involved, which is not represented by the capital authorized in the articles of incorporation.

Of the August total Colorado contributed $125,000, or 20 per cent, which is marked to the credit of the following mines:

Elkton, Cripple Creek, $5,000.
Golden Fleece, Lake City, $12,000.
Moose, Cripple Creek, $12,000.
Rico-Aspen, Rico, $25,000.
Smuggler, Aspen, $50,000.
Union, Cripple Creek, $6,200.
Victor, Cripple Creek, $15,000.

In this showing all the close corporations are excluded, as they do not publish dividends. This applies to such mines as the Little Johnnie at Leadville, the gold producers of Gilpin, the York and Last Chance at Creede, and the Smuggler, Union, Suffolk and Belmont of Telluride. Hence it is fair to conclude that the standing of the industry would be better shown by the unpublished dividends than by the fraction which is given to the public.

The dividends paid thus far in 1894—$4,610,134—drew $1,021,500 from Colorado mines. This means 22 per cent of the total, which is credited as follows:

Boreel, Leadville, $22,500.
Elkton, Cripple Creek, $40,000.
Golden Fleece, Lake City, $96,000.
Moose, Cripple Creek, $48,000.
Mount Rosa, Cripple Creek, $5,000.
Portland, Cripple Creek, $90,000.
Rico-Aspen, Rico, $200,000.
Smuggler, Aspen, $450,000.
Union, Cripple Creek, $25,000.
Victor, Cripple Creek, $45,000.

After paying the dividends for January the Cripple Creek mines were closed until the middle of July by labor troubles, thus cutting off their ability to even meet expenses.

Pennsylvania Company Stores.

Every merchant is guided more or less in the purchase of his supplies by the character of his customers, but the men who run the geueral stores in the coke regions of Pennsylvania have more peculiar ideas to meet than is the lot of the average storekeeper. These stores are all controlled by the owners of the mines, and it is said that some of them force their men to buy from them exclusively. The profits of these stores are undoubtedly large, although the prices at some of them at least are lower than they are at the usual country stores. The unique features of the wares carried in the stores are enormous feather beds, Polish and Hungarian head dresses, heavy boots for the women as well as the men, and all sorts of gaudy shawls and dress stuffs. Among the special provisions these stores supply are highly seasoned sausages and hams, such as are found in the Hungarian and Polish quarters of the town. The Poles are much more extravagant than the Huns and buy much better and higher priced goods. The Huns buy the cheapest kinds of meats, of which they make their golashes. They do not buy very much of anything in the way of provisions, however, relying largely upon their gardens for vegetables, and occasionally killing one of their ducks or geese. The Poles, on the contrary, rely very little upon their own efforts, although they also have good gardens, but purchase the best goods that the stores have. Very few of the purchasers pay cash. Instead, they secure from their foreman tickets for various amounts. These are presented at the stores in payment for supplies, and the clerks mark on them the amounts of their purchases. When the whole value of the ticket has been contracted for it is taken up by the clerk of the store.

At least a million dollars have been spent in this vicinity during the past five years in various enterprises, mining and agricultural. It is a sorrowful fact that to-day only one or two out of the dozen or more started are doiug anything. The enterprises themselves were feasible and good propositions. If they were all going uow we would have had good times here in spite of the general depression over the couutry. The explanation of their failure will be found generally to be poor management.—Yuma Times.

The present 1500-foot tunnel and turbine wheel pit of the Niagara Falls Power Company will, when it shall work at its full capacity of 100,000-horse power, divert 3.64 per cent of the total volume of water and reduce the depth of the crest along the entire falls to the extent of one inch and four-fifths.

Famed Meadow Lake.

Meadow Lake, which has such a wonderful history, is situated about eleven miles north of Cisco, Cal. There still remain portions of the old wagon road which was hewn out of the rock during those palmy days. At one time it was traversed by scores of freight wagons, and several trips daily were made with eight-horse fourteen-passenger stage coaches.

The manager of the Colfax *Sentinel* recently made the trip on horseback. The old stage road was crossed again and again by the trail. In some places trees many inches in diameter have grown in the very center of the road. For the greater part of the distance the road is still in good condition, though in many places the stone walls have given away. At best the trip by stage to Meadow Lake must have been a wild one.

At one time Meadow Lake had a population of 5000. During many years subsequently old man Hartley, the hermit, was the sole inhabitant. Hartley's death occurred, however, about two years ago.

A more picturesque spot than the site of this once world-famed mining town would be difficult to fiud, while the lake itself is enchantingly beautiful.

The lake is about a half-mile in width and extends along the depression of this mountain meadow a distance of nearly four miles. Surrounding the lake is a tract of level land comprising 40 or 50 acres, and the whole is almost completely enclosed by rugged peaks.

A score of buildings are all that mark this once busy city. The others have succumbed to the ravages of fire or been crushed by the heavy snows of this region.

Here at oue time could be found fiue churches, theaters and dance houses; schoolhouses, saloons, bakeries, breweries, banking houses, hotels and a daily newspaper; and a mining stock board in daily session.

The ruins of one stone building may still be seen. It was built by Perkins & Smith of Brady City, Sierra county, at a cost of $32,000.

Many persons who have never visited the camp will remember it distinctly from the fact of the regular assessments which they paid on mines located in the camp for them.

Some persons who have uever visited the camp are hasty in saying that the gold is not in the quartz. After visitiug a half-dozen ledges aud prospectiug the ore, the writer did uot find a ledge that showed less than twenty colors to the pan. He even took a horn of the tailings that passed from the plates at the old Californiа mine (formerly the property of Ralston) and secured from it more than a score of colors.

F. Chappellet, oue of the pioneer drift miners of California, now president of the Mayflower mine at Forest Hill, took an eight-stamp mill to Meadow Lake for the Mohawk and Montreal. During its operation he shipped more than $20,000 worth of bullion, but the ore was so rebellious that it could not be worked with profit, and one November day, wheu the first snowflakes began to fall, he rolled his blankets and walked out of camp several thousand dollars loser.

Following is a list of deserted stamp mills that still remain in Meadow Lake district:

12-stamp mill on the Grant.
10-stamp custom mill at Carlysle.
8-stamp mill, Mohawk and Montreal.
10-stamp mill, Orofino.
10-stamp mill, California.
5-stamp mill, above California.
10-stamp mill, Excelsior.
5-stamp mill, Old Wisconsin.

There are more than a score of arrastras and two smelters.

Within the past twenty years claims have been made that a successful process to work the ores had been discovered, all of which have failed.

A company from Salt Lake, backed by Stocktou capital, are at present hauling extensive machinery from Truckee to Meadow Lake. They claim to have successfully treated the rebellious ore.

On the strength of this, every claim and extension in the camp opeu to relocation has been taken up within the past six weeks. The following are locations:

The Excelsior, one of the best mines in the camp, belongs to the Hartley estate. It is a patented mine. Hartley had a process by which he worked his ore, and by it secured much gold, enough to keep Mrs. Hartley, the slayer of Seuator Foley, iu good society, with a frequent trip to Europe. Wheu he died he was preparing to work his ore on a larger scale. Mrs. E. A. Hersey, of Cisco, possesses the full knowledge of his process.

The Champiou mine is owned by Mrs. E. A. Hersey of Cisco, and is an extension of the Excelsior. It is a well-defined ledge from four to eight feet in width and shows free gold in many places.

The Oakland, O. K. and Gem have recently been located by Geo. Colby of Oaklaud.

The Bodie, R. A. Campbell and Wheeler.

Washington, William Hannah of Cisco.

Good Hope and Emma, by O. S. Holbrook, who recently died in Nevada county hospital, have been taken care of by his sons.

Grub Stake and Orofino, by J. P. Clark of Meadow Lake and F. J. Cook, now engaged in hydraulic mining in South America.

Black Cloud, G. S. Cook of Sierra City.

Enorma, F. J. Whitney, Wheatland, Cal.

The Nile, Thornton Davis, G. G. Davis and John Clark, the former of Sierra Valley.

Snowstorm, J. A. Morgan, Sierra Valley.

Dixie, C. Wichman and B. F. Atkinson, Sierra City.

The Sierra City, G. S. Cook and J. P. Clark.

The Central View, Jno. Spelenberg, Al Nicholls and Thos. Labroucke, Sierra Valley.

Little Daisy, Robert Sharkey, Sierra City.

Columbus, Northup Bros., Sierra Valley, one of them postmaster.

Sierra, formerly Old Pay Role, Thornton Davis and wife, Sierra Valley.

Diamond, Jno. Spelenberg, of Sierra Valley; Wm. Lehman, of Marysville; Jno. P. Clark, Meadow Lake, and Mr. Grant of Oakland.

Niagara, Jno. Spelenberg and F. X. Labonte, Sierra City.

Abe Lincoln, formerly Mohawk & Montreal, Joe Williams, Marysville.

Monumental, Watts Hughes and James Hill, Sierra City.

Lake View, A. H. Bemis of Salt Lake.

Mining Prospects in the Sierras.

A trip in the Sierras in uorthern California reveals much of interest to the casual observer. Rugged pine-clad mountains, intersected by canyous, creeks aud rivers and interspersed by beautiful valleys and lakes, are to be seen ou every hand. To one in search of the precious metals or the geologist, however, writes "Rambler" in the Reno *Journal*, something yet of greater interest presents itself. In this region is to be found that which has given to the world, directly or indirectly, the greater part of the wealth produced by the placer mines of California, the "Blue Lead" of miners' phraseology.

This most wonderful of ancient river channels has not received the attention that it merits from geologists or other scientific men. The study of it reveals the marvelous changes that have occurred in the topography of the country since the waters of the old river flowed from their unknown source—presumably in the north. This channel, which was ouce the lowest portion of this region, is now the uppermost portiou of some of the highest mountain ranges. It thus shows the working of the stupendous forces which have raised the once depressed region to its present height.

The general trend of this river was from north to south. It has been traced, by the blue gravel that is found in its bed, through the greater part of California, through Arizona and into Souora, Mexico. It, seemingly, has cut through innumerable gold bearing quartz ledges in its course and much of the wealth that was coutained in them is now distributed throughout the length of its bed. In nearly every place where the rim of the channel has broken down aud the coutents of the bed were forced out, rich placer mines have been found that in many places contained millions of dollars. Nearly all the rivers that have cut through this ancient river bed have also contained gold in great quautity. The "Blue Lead" has only in a comparatively few places beeu brokeu down or intersected by modern rivers. From this it will be seen that the greater part of its gold remains intact, awaiting the efforts of the miner to briug it forth.

On the portion of the channel that runs through the Grizzly range of mountains, west of Grizzly valley, several Reno companies have located claims. One of them has been sinking a shaft in order to ascertain the proper level at which to begin a tuunel. Another will commence tunneling soon. The rim of the channel has been broken down both north and south of these claims and rich surface placers have beeu the result. If one can judge by the large amouut of gold that has been taken from similar places on the "Blue Lead," he may reasonably expect those penetrating it at this point to reap a rich reward. The prospects are very eucouraging, to say the least, and well may those interested be enthusiastic.

Evidently placer mining in this part of California has only begun. In addition to the "Blue Lead," there are secondary channels cutting it aud mauy local channels, all of which will yield fabulous wealth. It may be said that ouly the rich surface deposits have been worked. A wise providence never designed that oue generatiou should despoil nature's treasure house of all its wealth; hence these deeper river deposits, where much time and labor are necessary to secure the gold they coutain. After all the precious metal has been taken from the placer miues some future generation may discover buried under lava caps iu the north the original ledges from which all this wealth has come, aud when this is done gold may become so plentiful that a cry will be raised for its demonetization.

Methods of Mine Timbering.

NUMBER IV.

Underhand stoping is the term used to indicate an operation the reverse of that described, being the method by which the miner takes out the floor of his level and continues the excavation downward in a series of steps seven or eight feet in height. In this method it is best for the economical handling of the ore, for ventilation, and for drainage, to have established a connection by winze with the level next below, or it will be necessary to hoist all the ore and water from the stope to the level above. The waste, if there be any, is thrown on platforms or floors between the face of each floor and the winze, slide or chute. This method is not advisable except in narrow, rich veins.

Underhand stoping is not commonly followed, but may be recommended in working small veins of very rich ore. It requires usually more timber than overhand stoping and the timber cannot be recovered as in the latter method.

In placing stulls to sustain the weight of waste, or to store ore already broken, the size and number of timbers to be employed must be determined by the width of the vein and the height to which the waste or ore is likely to accumulate. It is considered better to increase the number rather than the size of stulls. With good walls, stulls seven feet in length, having a thickness of twelve inches, placed thirty inches apart, are calculated to sustain sixty feet of waste or broken ore in a vein standing at a high angle. After waste has remained in place for some time it settles, and in some instances becomes so firm as to retain its solidity after the stulls have fallen out or have been removed. This need not be expected in wide veins.

When it becomes necessary to quickly catch up settling stull timbers or caps, a stout post, which will just slip under the sinking timber, is placed in position and four stout wooden wedges, having the inclined planes sloping alternately in different directions, are driven in between the post and stull. This plan will recover the subsidence, if not too great, and permit of reinforcing the timbers without losing ground.

A peculiar method of timbering, known as the "saddle back," is in vogue in some portions of Colorado. It appears to do well in the lead-silver mines having good limestone roofs and walls. It may be considered a modification of the "square-set." It requires less timber and is far less substantial. It will not do in heavy ground. The details differ with the various conditions encountered, but the principles are those obtaining in all other timber systems—the application of resistance to pressure. The drawings illustrate one method of setting up the saddle back.

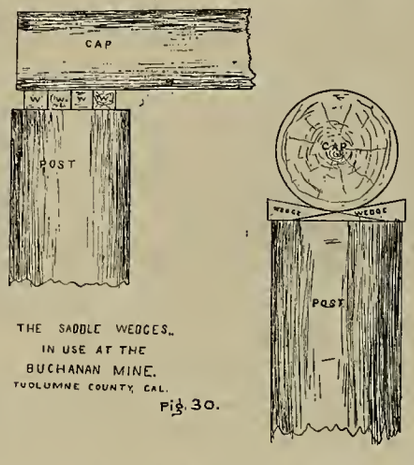
The accompanying sketch shows a design for a loading chute or slide, though they are not always made as elaborate as represented in the drawing. The inclination of the bottom should exceed thirty degrees, ores that are soft and wet requiring the slide to have a greater pitch than those that are dry. Between the two upright posts, which reach from the floor of the drift to the roof or to stout stulls overhead, two short uprights are placed, and on top of them, reaching from one to the other, is laid a 4x6 scantling. The gate, furnished with ratchet and wheel and pinion, may be dispensed with, loose boards being substituted, which may be pried up, when desired, with a bar. It is well always to build loading chutes in a substantial manner, so that rebuilding may not be necessary. It is a wise plan to provide false sides and bottoms, which may be quickly renewed.

The posts supporting loading chutes are not always placed perpendicular. In steeply inclined veins it is sometimes desirable to set them inclining forward. In vertical veins they are built across the vein.

In square sets, ore bins are constructed within the sets and the chutes are attached to the caps or ties, being arranged at convenient distances from each other.

In some mines, as in the Golden Gate, at Sonora, in Tuolumne county, large storage bins are constructed below the floors of the levels at the hoisting shaft, provided with a loading chute. The skip is stopped at the proper point and loaded. In this manner the necessity of waiting for cars, or loaded cars and men waiting for the skip, is obviated. In this mine, loading chutes are provided on the several levels from the stopes overhead, as a matter of course being constructed in the ordinary manner.

The systems of timbering hereinbefore described refer particularly to veins having a width not exceeding twelve feet, though mines have been worked under great difficulties, and where the operations were attended with extreme danger, where the distance between walls was twenty and even twenty-five feet. An instance may be mentioned in California in the Mount Jefferson mine, at Groveland, in Tuolumne county, where the vein was twenty-five feet from wall to wall. A very ingenious system of timbering was introduced in 1854, or thereabouts, consisting of long stulls supported by wall and inside props seven feet apart. Longitudinal braces, or ties, were also introduced to support the timbers longitudinally, but the support was insufficient, and a most disastrous case resulted. It is a matter of absolute impossibility, however, to recover, by the methods thus far given, all the ore from such great masses of mineral as were found in the Comstock lode, where one ore body—the Great Bonanza—measured 340 feet in width at one point, 600 feet in height and 1250 feet in length. Stopes in the various

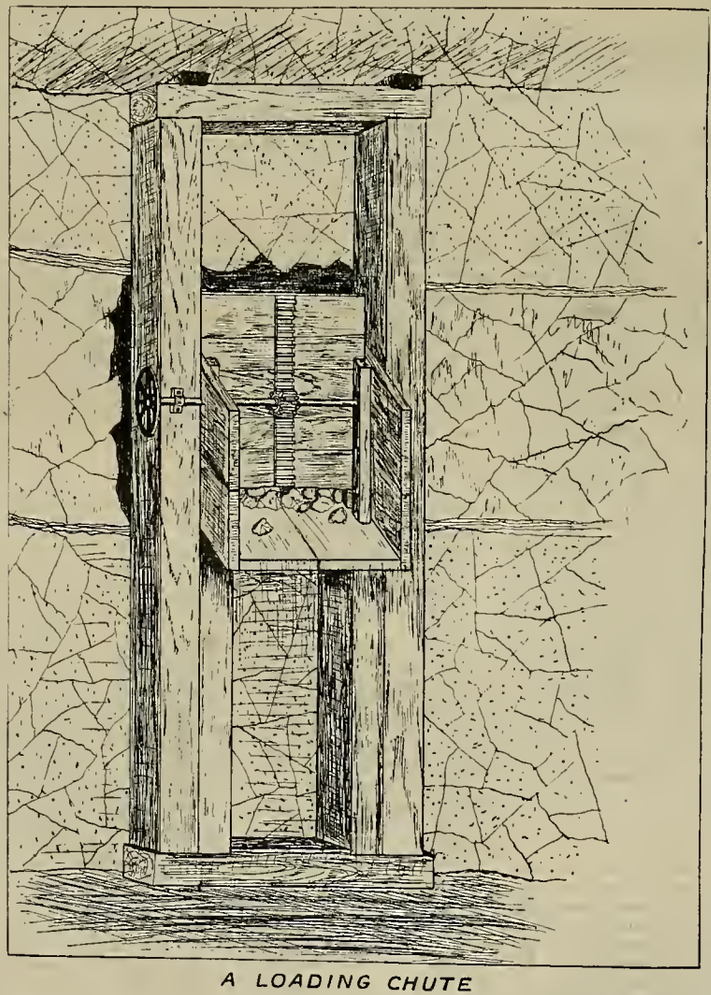


THE SADDLE WEDGES IN USE AT THE BUCHANAN MINE. TUOLUMNE COUNTY, CAL.

Fig. 30.

mines of the Homestake group, in the Black Hills, South Dakota, range from 40 to 150 feet in width and several hundred feet in length and height. The Caledonia mine, of this group, measured on the 300-foot level 195 feet horizontally. The Homestake vein at the surface, in the open cut, is 360 feet wide by actual measurement.

In California there are many mines of great value that cannot be worked by any system of stulls. The Stonewall mine, in San Diego county, has twenty feet or more of vein in places. The Alvord gold mine, in San Bernardino county, is a very wide vein. The Odessa, Occidental, Oriental, Silver Monument and



A LOADING CHUTE

Waterloo mines, of the Calico district, measure 30 to over 100 feet in width. Some of the mines of Bodie have very broad veins. The Josephine mine, in Mariposa county, has an immense ore shoot fifty feet wide. The Utica-Stickles mine, at Angels, Calaveras county, is 40 to over 100 feet wide, and the Gover mine, of Amador, has an ore body 30 to 50 feet wide. The Zeila, at Jackson, is working an immense mass of ore. The Boston mine, near Mokelumne Hill, is 40 to 60 feet wide, and some of the ore bodies in the larger quicksilver mines are of prodigious size. In addition to these, there are many other mines on the gold belt of California where the great width of vein precludes the extraction of the ore by the use of any system of stulls or simple posts and caps.

Veins and ore bodies of large size can be safely, completely and cheaply mined by using what is known as the "square set" system of timbering, introduced in 1860 by Philip Deidesheimer, while superintendent of the Ophir mine on the Comstock lode.

The following interesting reference to early mining on the Comstock is from Monograph IV of the United States Geological Survey, "Comstock Mining and Miners:"

"At the fifty-foot level (of the Ophir mine) the vein of black sulphurets was only three or four feet thick and could readily be extracted through a drift along its line, propping up the walls and roof, when necessary, by simple uprights and caps. As the ledge descended the sulphuret vein grew broader, until at a depth of 175 feet it was sixty-five feet in width, and the miners were at a loss how to proceed, for the ore was so soft and crumbling that pillars could not be left to support the roof. They spliced timber together to hold up the caving ground, but these jointed props were too weak and illy supported to withstand the pressure upon them and were constantly broken and thrown out of place. The dilemma was a curious one. Surrounded by riches they were unable to carry them off.

"The company was at a loss what to do, but finally secured the services of Philip Deidesheimer of Georgetown, California, who visited and inspected the treasure-lined stopes of the Ophir."

That the ore body could not be extracted in the usual manner was at once apparent, and Mr. Deidesheimer says he set about his task with some misgivings. He did not at one stride grasp the idea of the square set, but the system which now bears his name was the outgrowth of circumstances and the very necessities of the case. He instituted a policy, however, the wisdom of which soon became apparent.

The first step was to crosscut the vein from wall to wall, starting from a drift on the hanging wall side of the vein. As the work advanced he set up posts and placed caps above them, not across the course of the drift as is usually done, but along the sides, the idea being to form, when completed, a line of caps which would reach continuously from wall to wall. To accomplish this the ends of two caps were placed upon each post, except at the ends. These novel sets were held in place by pieces of 2x4 scantling 4½ feet in length and reaching across the drift from near the top of a post to that opposite.

Having successfully driven the crosscut, Mr. Deidesheimer now ran a drift some distance along the foot wall, timbering with posts and caps in the ordinary manner; that is, the caps were placed upon the posts at right angles to the drift and parallel with those in the crosscut. The posts in each case were set perpendicular. Returning to the point where these operations were begun, a second section by the side of the first crosscut was taken out and timbered with a single line of posts and caps, the 2x4 scantling being placed as in the first case. When this section was completed there were standing three lines of posts surmounted by three lines of caps, extending from the foot to the hanging wall. This was not really a new idea, as Mr. Deidesheimer had previously employed the same method in his drift mine on Forest Hill, when the breast was carried in 125 feet wide, the roof being supported by rows of posts with continuous caps.

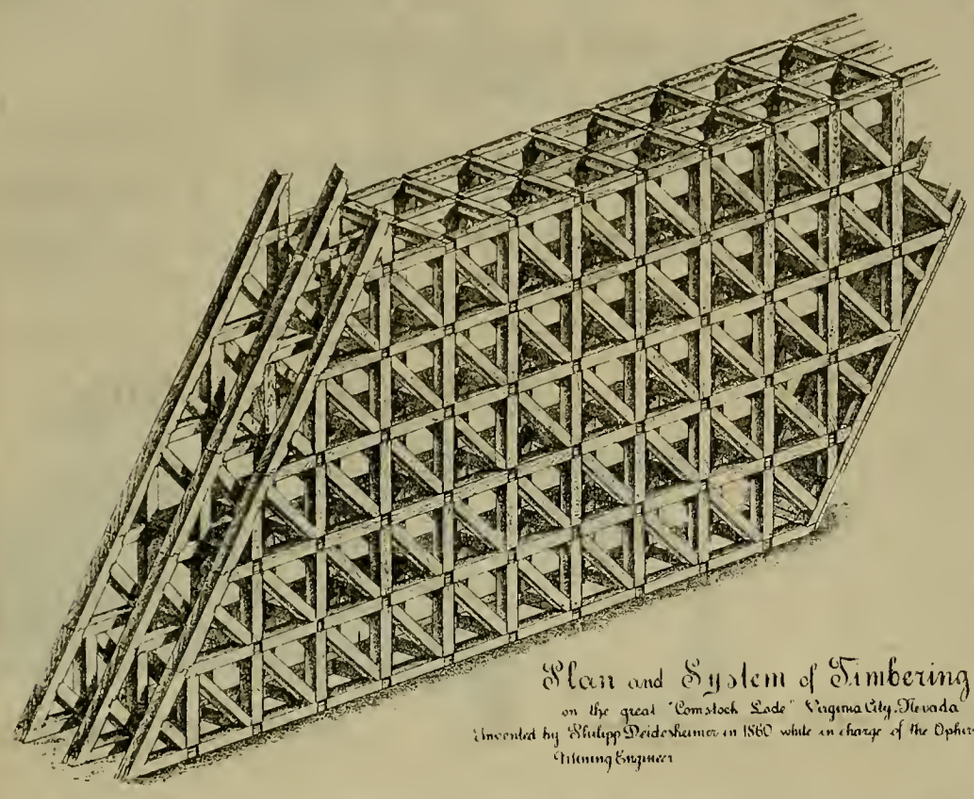
The work thus performed in the Ophir revealed the fact that an extremely rich body of ore extended upward from the level where this work had been done. The miners were directed to commence stoping upward in the body of soft, black, crumbling ore, and soon a considerable excavation had been made. It became evident that the ground must be secured at once.

In the Georgetown mine, that Mr. Deidesheimer had left but a short time before, the vein was vertical, and the walls were so soft and crumbling

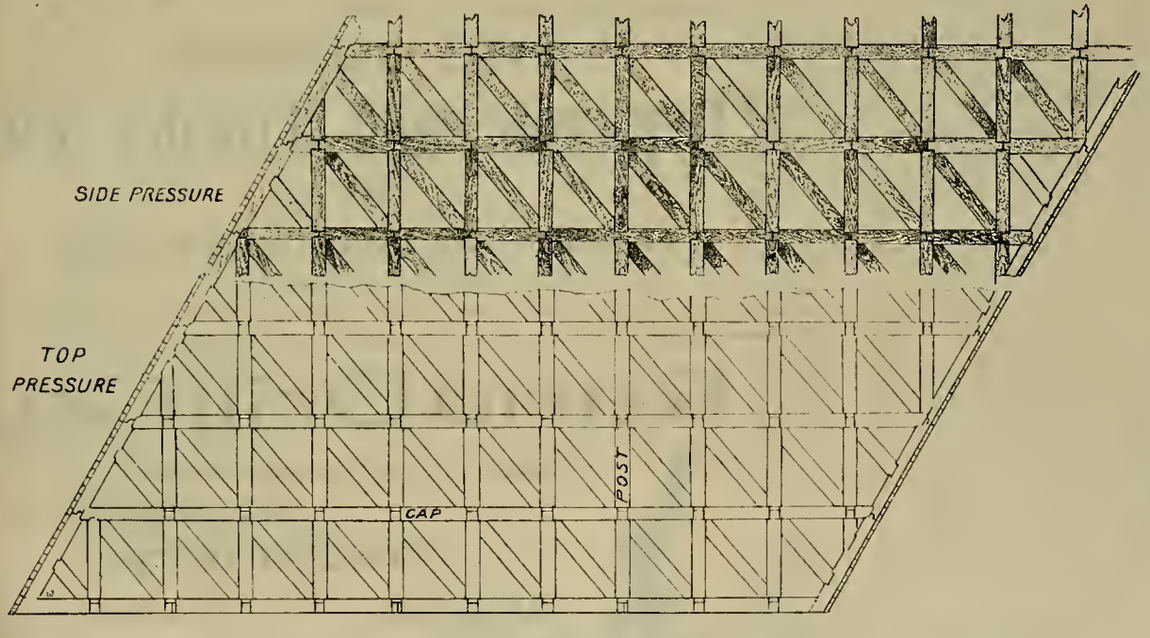
that, in order to stope out the mineral, he had resorted to the expedient of setting one post directly above another, the lower end resting on the cap, and in this way he managed to work the vein without much difficulty.

The Georgetown experience suggested the idea of adopting a similar plan in the Ophir. Accordingly, Mr. Deidesheimer had a mortice cut at the junction of two caps, which were already in place, and having a post framed with a tenon to fit, set the post in place directly above the one resting on the floor below. In a short time four posts were in position, with the caps upon them as below, together with the frail 2x4 scantling, the office of which was to keep the other timbers from falling down. The first an inch square. Two of these spikes were driven into a post at the proper height, and two in the post opposite, and the tie placed so that the ends rested upon these iron lugs, wedges being driven in at the ends to secure firmness. The posts and caps were now framed on the surface and delivered below, ready for use wherever needed. The work of mining now progressed much more rapidly and the problem seemed solved. Soon after it was determined to frame the timbers so that the ties might also rest on the posts. The stopes becoming of such great size, the dimensions of the timbers were increased and they were then framed as shown in the accompanying illustrations.

As the work progressed slight changes were made



Plan and System of Timbering
on the great "Comstock Lode" Virginia City, Nevada
Invented by Philipp Deidesheimer in 1860 while in charge of the Ophir Mining Engineer



"square set" timbers, it will be seen, were framed in the mine, the mortices being cut in the timbers in place. The work of extracting ore proceeded slowly yet, for the ground had to be secured as well as possible. It soon became evident, however, that something more substantial than 2x4 scantling would be required to keep the timbers in position, and it was determined to put in timbers of the same dimensions as those forming caps and posts. This was done at once, and the "square set" was complete in principle, though not in detail. The caps occupied all the space on top of the posts, leaving no resting place for the "ties," which had to be supported in some other manner. As they were looked upon as simply an auxiliary—a support to the posts and caps—they were only required to be held in position. Accordingly a lot of iron spikes were made, in shape somewhat like the thumb, having a sharp point at one end, the other end having a face three-fourths of from time to time whenever any improvement seemed possible. Sills were laid upon the floors of the levels as a foundation for the timbers above, which has now assumed massive proportions. The sill timbers were cut as long as it was possible to get into the mine. The men who were obliged to handle these ponderous timbers could see no reason why the sills should be longer than the caps, and had from the first looked upon the growth of this new system of timbering with much prejudice. When the great stopes were carried up from level to level the wisdom of the use of long sills became apparent, as they permitted the removal of all the ore and the placing of timbers without danger or loss, which could not have been accomplished with short sills, as when breaking up through the floor of a level from below short sills would have nothing to sustain them.

When, in the course of ore extraction, the work reached the walls, additional timbers, called "wall plates," were put in, as shown in the sketch of timbering in the Ophir mine. The caps were extended from the nearest post to the wall plate, except when a post came within two feet of the wall plate. In such case the cap extended from the wall plate to the second post in a single piece.

By a close inspection of the drawings the details may be plainly seen. It will be noticed that a system of braces reaching diagonally across the sets were also introduced, as well as close lagging on the walls. There is no doubt that the Ophir was the best timbered mine in the world, but the Comstock miners who gladly adopted the Deidesheimer system soon began to disregard many precautions which to them seemed unnecessary. The diagonal braces were left out, and the ground was found to stand about as well. Then, anxious to still further reduce expense and hurry the work of extraction, the lagging on the walls were dispensed with, and later, in somewhat firmer ground, the wall plates were left out, and finally the timbers were placed in rectangular sets, with only a few props here and there to the walls and roof. The disregard of these important details in American mines has resulted in numerous disastrous caves.

Owing to the careless timbering in the "Big Bonanza," in the California and Con. Virginia mines, cribs of solid timber had to be built, reaching from the floor to the roof.

(To be Continued.)

The Anti-Debris Association.

The Executive Committee of the State Anti-Debris Association held its regular monthly meeting last Tuesday afternoon at the rooms of the Board of Supervisors, in Sacramento. The counties of Yuba, Sutter, Sacramento and Colusa were represented by members of the committee. Chairman Morrison of Sacramento presided, and Robert Cosuer of Colusa acted as secretary. Reports from various committees were received.

The manager, W. T. Phipps of Marysville, presented his monthly report, showing the operations of the watchmen since the last meeting of the committee. He reported a general improvement in the rivers.

The attorney for the association, Robt. T. Devlin, made a report as to the condition of pending litigation and legal proceedings in preparation.

The chairman of the Legislative Committee, George Ohleyer of Yuba City, presented a report in which he called the attention of the association to encouragement given hydraulic mining in the platforms of the Republican and Democratic conventions, and stated that it presaged an attempt to secure by legislation what the courts had strongly pronounced against.

He stated that the miners were attempting to enlist sympathy by pleading that the hard times were due to the stoppage of hydraulic mining, and that the resumption of that industry would again bring prosperity to the land.

The Geographical Society of the Pacific.

The Geographical Society of the Pacific opened the course of meetings for 1894–95 last Wednesday with a paper on Corea, by M. Odagiri, Chancellor of the Japanese Consulate in San Francisco. Mr. Odagiri resided several years among the Coreans, and had constant opportunity to observe the people in their daily lives. The society has been at considerable expense to obtain new slides, showing landscapes, portraits of prominent Coreans, etc., to illustrate the lecture with the camera.

Apart from the inherent merit of the subject, considerable present interest attaches to Corea, it being the cause of the present war between China and Japan. The paper, which was read by Prof. Geo. Davidson, president of the society, was of value and favorably received.

At the second meeting a paper will be read by Jeremiah Lynch, of this city, corresponding secretary of the society, on the important discoveries lately made near Thebes, in Egypt, by the American exploration party, and also those of Flinders-Petrie.

Valuable Information Up to Date.

The MINING AND SCIENTIFIC PRESS of San Francisco has recently entered upon a new volume—the fifty-ninth of its honorable career. The event is celebrated by a new dress, which makes the journal more attractive to the eye; but it would be hard to make it more attractive in its contents, which afford a storehouse of valuable information, up to date, on scientific and mining subjects not to be found in any other paper o this coast.—The Investor, Los Angeles, Cal., Sept. 12.

Scientific Progress.

How Not to Use a Compass.

Mr. C. E. Finlasou, in his "Nobody in Mashonaland," gives an account of how he and his friends got lost in the bush, and shows what precious little use a compass is to travelers who bave not thoroughly mastered that simple-looking instrument. Mr. Finlason's landmark was certain telegraph poles, and when he and bis comrade lost sight of them they had to fall back on the compass, having had no sun that day to serve as guide.

"In taking my observatious I had carefully noted that tbe needle pointed dead at the camp, but I did not turn the compass so as to bring the needle over the "N." So it transpired that my observation was ouly useful in indicating the whereahouts of the camp when we got to the poles. Another little thing which added to the confusiou was the fact that I not did know for certain whether the black or white half of the needle pointed to the N orth, and I had also forgotten which end poined to the camp. And let me add that this little difficulty of the black and white needle is not at all an uncommon one with novices. They know all about it, of course, before they are lost, and would he indignant if auyone should infer (sic) that they were eveu likely to be in doubt on the point. But when ouce they are lost, and the fact, at first resisted, is slowly and surely borne iu upon them, it is surprising how speedily and completely their heads follow their bodies."

Mr. Finlasou and his two friends eventually found their way by tree climbing and the activity of anxious friends.

Origin of Petroleum.

Professor Mendeleeff advances the theory that petroleum is of mineral origin, aud that its production is goiug on and may coutinue almost indefiuitely. His hypothesis is tbat water finds its way below the crust of the earth and there meets with carbides of metals, particularly of iron, in a glowing state. Oil-beariug strata occur in the neighborhood of mouutain regions, where it may be supposed that the dislocations of the strata afford passages for the access of the water. The water is decomposed iuto its coustituent gases, tbe oxygen unites with tbe iron, while the hydrogen takes up the carbon and ascends into bigber regions, wbere part of it is condensed into mineral oil, and part remains as natural gas to escape wbere it can find an outlet, or to remaiu stored at great pressure until a bore is put down to provide it a passage to tbe surface.

Laboring in High Altitudes.

Some curious facts are brought to light on the capabilities of meu to labor at bigh altitudes during the construction of the Peruvian Ceutral Railroad. This line starts at Lima and, proceeding inland, reaches its highest point at the tunuel of Galeria, 15,645 feet above sea level. It is stated that men were able to do a fair "sea level" day's work as loug as the altitude did not exceed 8,000 to 10,000 feet above sea level, but beyond this there was a sudden falling off in the work of one-fourth to one-third up to heights of 12,000 feet, and at still higher elevations 100 men were required to do work easily done by fifty at sea level.

EXPERIMENTS by an English mine inspector have shown that gunpowder blasts in the presence of dry coal dust always unite more or less of the dust and will produce violeut explosions, increasing in force with the purity of the coal in a dusty atmosphere. He recommends discarding gunpowder, as certain "high explosives" (roburite, ammonite, etc.) prove to bc incapable of igniting or exploding coal dust.

ELI WHITNEY, grandson of the inventor of the cotton gin, is reported to have invented a machine for picking cotton that will do the work of 100 men.

Electricity from Coal Fields.

Electric power distribution is at present one of the most urgent of questions with the advanced electrical engiueer. Activities in this directiou so far are focussed in tbe utilizatiou of water powers. The success attending these efforts has, in a commercial and practical sense, demonstrated their value. This assured, the enterprise at Niagara is but the climax of a series of efforts, in which tbe humbler success is merged in the greater accomplishment. Where natural forces are available, and science succeeds in transmitting power to distant consumers on an economic and profitable hasis, the work of the engincer in this field is uot likely to be limited to a cataract or a tidal wave. Other sources of power are available where that of water may be too remote for practical purposes.

In fact, the electrical engineer is moving on the coal fields, where the generation of power may be secured without the trausportatiou of coal. There are, of course, many factors in the matter to qualify the prospect of practical success. The suggestion, however, is not without its value, and it may be accepted as a foregone conclusion that enterprise in that direction will sooner or later settle the problem. A scheme has been mapped out for the generation of electric power in the center of the Midland coal fields in England, to be transmitted to the various manufacturing towns of that industrial hive, and so far south as the metropolis. The plau outliued for the geueration of power contemplates the utilization of gas obtained from coal at the mines, aud feeding gas engines of 300-horse power each. If the figures of cost as given are anywhere near the truth, tbc heuefit in au economic sense to the consumer would make the proposed enterprise a commercial success without question.

Blind and Black Frogs.

Hon. A. B. Fall of the Supreme bench hasn't exactly a white elephant on his hauds, but he has something much more curious aud iuterestiug in the sbape of a whole settlement of black frogs, found in his Sunol mine in the Black mountain mining district, uear Las Cruces. He was telling some of his friends about the matter and the facts form quite an interesting addition to the biological history of New Mexico. A number of men, it seems, were sinking a shaft in this healthy gold producer some weeks ago, when at a depth of 190 feet they struck in an underground stream a perfect stratum of small black frogs. Upou examination they were each found to be about the size of oue's thumb, and to be entirely bliud. Another curious fact was that the stream in which they lived was seventy-seven feet below the water level, and upou analysis it was found to contain no organic matter whatever.

The only other points at wbich such frogs have been found are in California and England, aud their existence in the Sunol mine is additional proof that New Mexico is up with the rest of the world in all matters, eveu including subterraueau frogs.

Prof. C. L. Herrick of the Department of Biology, Dennison University, at Grauville, Obio, bas heard of this find and writes to parties at Las Cruces requesting tbat specimens be seut him.—Santa Fe New Mexican.

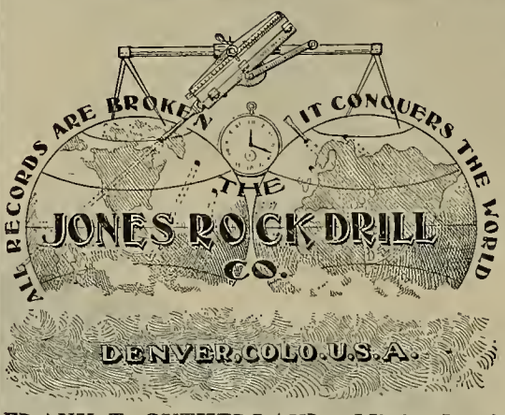
THE JONES ROCK DRILL
IS THE
Only Successful Hand Power Drilling Machine Ever Invented.



It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should he in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

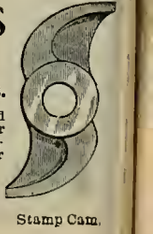
Adamantine Shoes and Dies
—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates.
These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.
Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent, 22 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill Supplies.



Stamp Cam.

Mechanical Progress.

A Substitute For Hard Rubber.

Cellulose is the tissue constituting the principal fabric of wood. linen, cotton and paper. and is composed of exactly the same constituents as starch. It has long been known that if pure cellulose were treated with caustic soda, or "mercerized," the fibers would swell up. and even when the soda had been washed out thoroughly there would still be a slight increase of weight perceptible. This latter effect is due to the chemical union of one element of water with two of cellulose. For over two years chemists have been carrying on experiments with mercerized cellulose, and, have discovered a number of valuable industrial applications of a derivative of this substance. In their enthusiasm they are inclined to believe that the achievement, which is the fruit of thorough education in chemistry. patient investigation and originality of ideas, will rank with Goodyear's in range and importance. No statement is made of its cost in comparison with vulcanite, ebonite and celluloid, but the properties developed show that the new material is available for much the same purposes as those old ones, while in some respects it is perhaps preferable.

The investigators find that if mercerized cellulose were treated with carbon bisulpbide vapor, the mass would at the end of three hours possess a golden hue, and when dissolved in water form a viscous solution like molasses. After a few days, however, the liquid and solid would dissociate and an insoluble coagulum would result. This latter when well washed and removed from the water hardens into a compact, horny substance, with a specific gravity of 1. 5.

In that condition the new compound makes excellent buttons, tool handles and similar articles. It may be easily colored, takes a high polish, and is very tough. It may be readily turned in a lathe. It also makes admirable insulators. While still in solution the thiocarbonate (or product of treatment with carbon bisulphide) may have some "dehydrating" substance like alcobol added to it. and then it can be drawn out in a fabric of any degree of thickness, from that of a tissue paper to that of veneering. It is as clear as glass, and makes admirable flexible photographic plates. Sheets of it may be stamped into trays, boxes, brush backs, inner soles, book covers and an endless variety of objects, and these can be embossed in elaborate designs at the same operation. As a wash applied to paper in process of manufacture, the solution gives a particularly fine, strong size. Used as a medium for pigments in printiug cotton goods, it makes the colors stick to the fiber. Applied to cloth as a facing, it will serve for upholstery, book-bindiug and even floor coverings, besides forming a good substitude for leather. Cloth having a coating of thiocarbonate will be flexible in washing, but will stiffen when ironed; so that shirt bosoms, collars, cuffs, starched muslins and tablecloths may be made from it advantageously. It is superior to glue, and cheaper, and may be used cold instead of needing to be heated.

Bessemer on Bessemer Steel.

In an article ou the steel industry which bears his name, Sir Henry Bessemer reminds us that a third of a century ago Sheffield steel made from the costly bar iron of Sweden realized from £50 to £60 a ton. Now, by the Bessemer process, steel of excellent quality can be made direct from crude pig iron at a cost ridiculously small compared with former prices, aud in quantities which the old steel workers never dreamed of dealing with at one operation.

Iu lieu of the slow and expensive process of converting wrought iron bars into crude or blister steel by ten days' exposure at a very high temperature to the action of carbon, east iron worth only £3 a ton is, Sir Henry says, converted into Bessemer east steel in thirty minutes wholly without skilled manipulation or the employment of fuel, and while still maintaining its initial heat it can at once be rolled into railway bars or other required forms.

The article gives a vivid picture of all that has been brought about by this revolution in a manufacture in which up to our own time there had been no change since blades of matchless temper were wrought in the forges of Damascus and Toledo. Steel is now adapted to a thousand purposes of which our ancestors had no conception.

By way of giving some idea of the enormous production of Bessemer steel now, Sir Henry asks us to imagine a wall five feet in thickness and twenty feet high, like a gigantic armor plate formed into a circle aud made to surround London. The inclosure so made would contain an area of 795 square miles, and this great wall of London, weighing 10,500,000 tons, would just be equal to one year's production of Bessemer steel.

One of the novel features of a recent military tournament in Eugland was the use of the typewriter on the battlefield for the purpose of recording messages from signalers. It is stated the typewriter operator was also an expert bicyclist, and had his Remington mounted on the handles of his machine. He rode in and out among the horses aud gun carriages without the slightest mishap, and whenever he came to a standstill be instantly braced up tbe bicycle by a handy contrivance and pounded away at the typewriter wbile in the saddle. The message, when completed, was sent to the commandiug officer iu the rear by meaus of a trained dog.

A curious source of wealth is reported by tbe French consul at Mongtze, in upper Tonquin. It lies in wood mines. The wood originally was a piue forest, which the earth swallowed in some cataclysm. Some of the trees are a yard in diameter. Tbey lie in a slanting direction, and in sandy soils which cover them to a depth of about eight yards. As the top branches are well preserved, it is thought the geological convulsion which buried them caunot be of very great antiquity. The wood furnisbed by these timber mines is imperisbable, and the Chinese gladly buy it for coffins.

The Ivanboe tunnel, whicb is ou the poiut of being completed, is cut through the backbone of the Rocky mountains from Busk, a small hamlet fifteen miles west of Leadville, Colo., to Ivanhoe, another little village on the west side of the main range. The tunnel is 9400 feet long, 21 feet high and 15 feet in the clear. During construction the tunnel was lighted by electricity, with an arc light every eighty feet, and several large air compressors supplied fresh air to the workmen. At eacb approach eight compressed-air drills were working, but the amount driven per day averaged only eigbt feet.

A scheme has been proposed to reduce the friction of salt water against the sides of a steamer, whicb, it is claimed, will increase the speed forty per cent. It is to force air through the vessel's plates aud thereby form a narrow space between the iron and water.

HEALD'S
Business College,
24 Post Street, - San Francisco
FOR SEVENTY-FIVE DOLLARS
This College instructs in Shorthand, Type-Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. Send for Circular. C. S. HALEY, Sec.

LIGHTNING / LARGEST / WELL MACHINERY Works.
All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

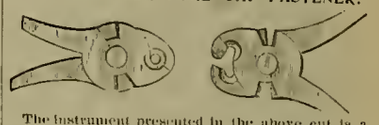
Trade Mark.

GIANT POWDER FURE CAP FASTENER.


The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.
MOONEY & SHERWOOD Fresno, Cal.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—GOLD AND SILVER ORES.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assays; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price $1.00 postpaid. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
SECOND EDITION—PRICE $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.
Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphury Salt; Note.
One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

The Russell Process.
For information concerning this process for the reduction of ores containing precious metals, and terms of license, apply to
THE RUSSELL PROCESS CO.,
Park City, Utah.

California Inventors Should consult DEWEY & CO. AMERICAN and FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. No. 220 Market St., San Francisco, Cal.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

Ledger: A. B. Summers and A. J. Crain of Plymouth are opening up a property near the Cosumnes.

Fredric Chisholm of the Extension Mining Company drove a tunuel to prospect the known ledge on their property at the south end thereof. The result was satisfactory and the company is preparing to siuk a shaft.

The Median has been opened to the 200 feet level. The first 100 feet was caved but the second 100 feet was open and the timbers good. They crosscutted to the ledge and are running ten stamps and four concentrators at the South Spring Hill upon good paying ore.

H. F. Vogt has a steam pump throwing water from the Mokelumne river at Dutch Bar into his sluice hoxes and has just commenced to wash gravel which prospects well. He has equipped the property with a boarding house, shops, sleeping houses, etc., and expects to run continuously.

The New London Company has cleaned the shaft out seventy-five feet. They are timhering it temporarily, until their hoist is erected.

The Pioneer mine, Dr. Boyson sole proprietor, at Plymouth, has twenty-six men employed. Ten stamps of its twenty are almost ready to run. The shaft is down over 800 feet and at the lowest level he is drifting north and south on a six foot ledge which is prospecting well. S. C. Higgins has charge of work. The mine is thoroughly equipped and the doctor is very sanguine of its being a great gold producer.

The Bay State company is still sinking and will continue till they reach 640 feet. At 600 feet they will open up the ledge and start their mill. The sinking is heing done hy contract. Work has beguu on the new mill the iron work of which has heen let hy contract to the Fulton Iron Works. A new pipe line will have to he laid 2500 feet which will give them a fall of 323 feet.

El Dorado.

FROM INDIAN DIGGINGS.—Amador *Record:* Five or six Amador county practical mining men have heen at work on the extensiou of the old Volcano mine, and are meeting with good encouragement. They are sinking a shaft to strike the channel. They have cut through a hed of lava cement and are now in secondary river wash, which gives evidence that a large volume of water flowed through the channel. It is thought that hedrock will be reached in a month or so, wheu the work of crosscutting the channel will he commenced in order to ascertain its width.

The Plymouth Cousolidated Mining Company at Indian Diggings are running a tunnel to gravel hed to ascertain whether it will pay to ground sluice and open up a cut to it, so as to hydraulic it. The company receutly struck swelling ground in the tunnel, which has delayed progress some, as it has necessitated retimhering a portion of the tunnel.

Mr. Williams, who honded Mr. Cope's claim, is preparing to commence work. He will run a tunnel for the purpose of tapping the river channel by hydraulicking the other portion of the claim.

Mr. Leopold is doiug well with his new prospect. He has a good ledge of $20 rock. He is using an arrastra to workthe rock. His last week's run amounted to four and a half ounces, a very good showing for the work of two men, especially as the rock had to be sledded ahout one-fourth of a mile.

Nevada.

THE SPANISH MINE.—*Transcript:* The shaft at the Spanish mine in now down 175 feet, and is to be sunk 100 feet deeper, it being the intension of the owner to thoroughly exploit the mine and work it in a systematic manner. Splendid rock is being taken out right along and the mine never looked hetter than it does at the present time. We understand the shaft is to be enlarged so as to allow a double track for cars. At present there is hut one traek in the shaft. This arrangement will greatly facilitate hoisting when the mine is opened sufficiently to permit of more extensive work underground.

It is ahout a year ago since A. R. and Atherton Lord sold the Spanish mine to the company now operating it. The price was $55,000, of which amount $25,000 was paid down. The last payment on the property was made yesterday. More than enough money to pay for the mine has heen taken out of it during the past year and the output for the ensuing year, it is expected, will greatly exceed that of the last twelve months.

Plumas.

BIG PROSPECT STRUCK.—*National Bulletin:* A note from Mohawk informs us that on the 9th inst Walter Scott struck a rich prospect in a ledge at the head of Rhoads' Ravine, Mohawk Valley. He ohtained as high as two dollars of coarse gold to the pan. Messrs. Scott, Canisty and Carothers are developing the find at present.

Fully $30,000 in placer gold in years past has heen taken out of two gulches fed hy the ledge just struck by Mr. Scott. This is a gold region. As much gold has been taken from the placer mines helow, reasonahly certain it is that Mr. Scott has struck the source of the rich gravel.

San Diego.

THE OGILBY DISTRICT.—"The gold mines of eastern San Diego county are destined to astonish the world," said D. M. Duhray to the *Union.* "I have just returned from Gold Rock camp in Ogilby district, and the people of San Diego do not imagine what a treasure they have in their own county. The mines in that district, I verily helieve, on my own opinion and that of every mining man who has seen them, will become the greatest gold producers in America, if not in the world. Such immense deposits of ore are rarely to he found anywhere, and when you add to this the fact that the ore is of high grade, running not less than $10 per ton, you can imagine the honanza in sight. The deepest mine in the camp is 300 feet down, and not another foot needs tc he sunk to keep a hundred-stamp mill running for the next three years. Neither wall in this great orc hody has been found—in fact the ore seems to he more of a deposit than a vein, though I have no donht that the formation is regular and that the gigantic veins will he found to run with the trend of the Cargo Muchacho mountains in which they lie.

"The Golden Cross Mining and Milling Company is owner of the properties worked at present, the main mine being the Golden Queen in point of development. Thirty men are at work in the mine, and seven men break enough rock to keep the forty-stamp mill going night and day, crushing 120 tons. One man develops enough ore to keep fifty men husy. Some of the hig stopes in that mine would easily contain the higgest huildiug in San Diego, if not quite the Hotel del Coronado. Two hundred and fifty people are in the camp and the population is rapidly growiug. Other companies are hecoming interested and more prospects will soon he developed, with every indication that they will he as hig as the Golden Queen.

"For years these gigantic deposits were deserted, and Eastern capitalists laughed at the reports made on them, deeming them lies and impossihle of fulfillment. Then the Hedges hrothers and a couple of other Los Angeles men went in, and hy hard work, economy and daring they got the properties developed, piping water from the Colorado, twelve miles distant, and erecting a forty-stamp mill. Within a year they had iu sight a greater property than anything in South Dakota, greater thau the Treadwell in Alaska, and perhaps the best all-round gold property in America. Everything seems to favor the camp. The ore is appareutly of all kinds and colors, yet it is all free milling. The gold is as good as reaches the San Francisco mint, reaching $20 per ounce. With all these things the Englishmen hegan to get interested, and they offered $1,000,000 for the properties; but it was the Americans' turn to laugh, and they would not entertain the offer. The Hedges own three-fifths and other parties the balance, and all efforts to buy into the company have failed. I helieve that within two years the mines will be worth in cold cash $5,000,000.

"The district," continued Mr. Duhray, "is a big one, and the mountains seem to be full of ore as promising as that on which the Hedges are working. Mining men are puzzled when they come to look at the district, as in many features it is an entirely new problem in geology and mineralogy. All agree, however, that the district will astonish the world with its yield of gold. The Golden Cross Company will increase its stamps to 80 and later to 100, and with other companies going in there will he greater activity and an immense camp built up. The camp is four miles north of Ogilby station, on the Southern Pacific.

Shasta.

WHISKY CREEK MINING DISTRICT.—*Courier:* The quartz mining interests of Whisky Creek mining district have received this past spring and summer an impetus that is not only of considerable importance to the State hut encouraging to all who feel an interest in the miuing welfare of Shasta county.

The old West End mine which a short time ago passed into the hands of mining men of some capital, and which has heen under the management of D. Hunt, has heen sunk to a depth of 100 feet, showing a sufficient amount of high grade ore to warrant the projeetors in further developing the mine hy way of tunneling into the mountain on the ledge and to this end a contract was given a few days ago to Hunt by A. James, an old mining and mill man of considerahle capital. This mine, like the Gold Dust mine, lately purchased hy Lyson, Walters & Co., is situated in close proximity to Stella. Mr. W. & Co. lately clcsed down on their mine for the purpose of prospecting their mining property further north. This Co., we are ereditably informed, will resume work early this fall not only on the Gold Dust hut on several other mines which they have contraeted for in this section. This latter company, like that of the James and Hunt company and several others we will shortly mention, are men of energy, means and intelligence, and understand their business, and it has passed heyond the question of a doubt that success awaits them in the near future.

The Mad Ox mine, so well and favorahly known, is heing further developed every day hy a force of energetic miners hacked by O. P. Woodward. Late developments in the 1600 foot tunnel show that there is quite a large and rich deposit of free milling ore existing still in the old Mad Ox, and it is safe to predict that the grand and popular mine will ere long pass into the hands of mining men of means and again the steam whistle will be heard in the deep confines of rugged mountains near the head of the old Whisky Creek.

Mr. Hetchell's arrastra, near the Whisky Creek hridge, is being run night and day on very high grade ore and Mr. H. is doing well and the indications are that his old Pine Top mine will bring him out on top. His ledge is rapidly increasing in richness and in size, and it is the wish of everyone in this vicinity that he may make himself independent, for he is a very deserving and hardworking citizen.

A Denver company has lately secured several patents of mining claims on and around Dog Gulch, and mining matters in that vicinity are quite lively and exciting.

Passing north in the neighhorhood of Iron Mountain, Messrs. Martin, Davis and Record have done a grand work in the way of development on several promising mines and they will either sell, or construct reduction works themselves this fall, and he prepared to commence crushing quartz ere the fall rains begin.

A BIG ENTERPRISE.—*Examiner:* Hugh McDonnell of Chicago, who was one of the leading mine-owners of Leadville during the palmiest days of the carhonate excitement, has just completed a thorough examination of the Iron Mountain mine, Shasta county, for a New York syndicate, and says he has, as the consulting engineer, recommended its purchase, and has no douht the syndicate will take it.

"The price I do not feel at liherty to state, but it is several hundred thousand dollars. We will erect a large smelter there capahle of treating 250 tons of ore a day, and will employ in it and the mine several hundred men. The mine is a very large one and has an enormous hody of ore exposed, which runs $41 a ton in gold and a large amount of copper and lead. The ore will he reduced to a mat, not bullion, and will then be shipped.

"There is already 2250 feet of development on the ore hody, too. This is aside from other tunnels and shafts that do not yet reach the ore. There are 360 acres in the mining claims. Besides this there are 740 acres more of timber adjoining, making in all 1200 acres. The persons from whom we are buying are Charles Camden of Oakland and James Sallee and Mrs. Colonel Magee of Shasta. The Iron Mountain is four miles from the California and Oregon railroad and ten miles from Redding. We shall work it on a large scale."

At French Gulf, the Gladstone mine, owned hy Cleveland, Ohio, people, is running a thirty-stamp mill and a chlorination plant. The vein of this mine varies from four to twenty-six feet in the fissure hetween the walls. It is one of the most remarkable producers of the county. The Washington mine has been producing steadily for thirty-five years in one fissure. Adjoining this is the Niagara, formerly owned hy William T. Coleman of San Francisco, who made and spent three immense fortunes on it. Adjoining it is the Tom Green mine, named after its owner, and the Scorpion and Myers mines, both of them private properties. None of the owners can be approached in any way. Each is averaging about $50,000 a year net and knows a good thing when he sees it. The Old Diggings district, on the east side of the Sacramento river, ten miles from the county seat of Shasta county, is a very interesting one. The Walker Brothers of Salt Lake City operate a miue which they call the Utah and California. It was formerly a large producer and yielded the owners many times what an ordinary man would regard as a fortune. The Walker Brothers are now developing an "upraise" from a deeper tunnel, which they have just completed. The vein they are working will average from ten to sixteen feet in thickness, and will yiold $18 a ton for an indefinite period.

Sierra.

MINING DEVELOPMENTS.—*Messenger.* San Francisco capitalists are negotiating for the Wm. Tell ledge.

Parties from San Francisco have two men prospecting at the Mountaineer ledge with a view of purchasing.

It is rumored that the Sierra Buttes Company intend to negotiate for the purpose of the Keystone and the adjoining ledges.

Four men are at work on the Young America tailings. More arrastras will he put up soon. The recent cleanup was satisfactory.

No work is heing done at the Colombo. The huildings, etc., have heen purchased hy the Phœnix company and are heing takeu to their mine.

Six men are working on the Clevelaud ledge, ten at Chips and five on the Salinas and Mercer where a new ditch is being put in several thousand feet in length, J. E. Freeman superintending the work.

Parties have heen up to look at the Comet ledge at the head of Jim Crow canyon. Three ledges ahove run into one helow, thirty feet in width, twenty-five of which pays $4 to $5 a ton.

The Sierra Buttes company has recently increased its working force up to twenty men, and their ore is hetter paying than four years past. Steve Thomas still officiates as superintendent.

About eighty men are husy at the Bonanza mine. The rock is very rich and is crushed in a forty-stamp mill, run hy water power and lumber is coming for the huilding. The cleanup for last month was $15,000.

S. W. Langton, R. Sharkey and L. Thompson are prospecting at the Sacred Mount ledges, now called the Buttes Extension, Nos. 1 and 2, between the Saddle Back and Sierra City. The tunnel is in 359 feet, with good-looking ore ahead.

Gladie mining company, operating at the Phœnix ledge, is replacing the old iron with new steel rails in the mine, and preparing a station inside for an electric hoisting plant, costing $3,500, to continue sinking and, also, illuminate the works and Sierra City with electricty. Thirty-eight men are employed. Under the able management of Supt. W. T. Stanley the property is being advantageously developed.

Siskiyou.

MINING NOTES.—*Journal:* Marion Freshour was in town yesterday, and brought a big fat sack of gold dust from the Benz Bar mine on Klamath river, near Honolulu. This claim is the hest paying mine on the entire Klamath, and will continue to help out the gold market very materially until the winter storms stop operations.

Tho pay channel having heen lost in the Beehe Bar mine, Klamath river, now under the superintendence of A. Smith, a drift was run across the river basin, which resulted in finding the pay channel, that yields good prospects. All apparatus will he moved so as to reach the new spot, with good prospects of taking out considerable gold before winter sets in.

The McConnell & Quinne claim is lying idle this season, owing to the high stage of the river, which is still one and a half feet above low water mark, with no prospects of getting any lower, this claim not being workable nuless the steam reaches low level of the average seasons. The river was four feet above low water mark for ahout four months, owing to the great amount in the Klamath lakes, from which it is fed, together with an unusual quantity of snow on the mountains. The claim is leased hy Dr. Songer and Messrs. Watson and Dame, of Ashland, who have $3,000 worth of machinery at the claim, with expectation of working it next summer. They have a three years' lease, with privilege of two more.

All the claims on the upper Klamath, ahove Shasta river, are reported as paying well, especially those in the Ash creek section.

The Schroeder quartz mine at Deadwood is paying well at present, with the mill kept running steadily every day and night.

NEVADA.

Kennedy District.

THE IMPERIAL MILL.—*New Era:* The mill is reducing hetween sixty and seventy tons every twenty-four hours. There are two great advantages, which are hut exceptionally met in mining camps, namely, the great capacity per stamp and the easy working of the ground in the mines. The Manhattan mill, in the famous camp of Austin, had a capacity of a little over one ton; the Imperial ranges from three to three and a half tons. The average cost of mining a foot of ground is $10; in Kennedy the average is $2 to $3, which means that the cost of extraction and milling in Kennedy should he from one-half to one-third of the average camp, other things heing equal. Even in the matter of fuel, Kennedy is favorahly situated, the company getting pine wood delivered at $5.50 a cord. The ores are not roasted, but are reduced hy the simplest process known to millmen—plates and concentrators—aud since the first partial cleanup, after a week's work on oxide and sulphurets, has demonstrated its success, it is with pride we give to Kennedy the name of "Imperial" over any camp in the State, the present Comstock not excepted, and join with our citizens in proud mentioning.

OREGON.

The L. Sisley placer claims, known as the Jordan ranch, on Burnt river, have been honded to a Utah syndicate represented by a Mr. Holmes. It is the purpose of the new company to equip the mines with machinery. A pump capahle of raising 200 inches of wator 200 feet will be put in place.

Josephine County.

PROGRESS OF DEVELOPMENTS.—The Anaconda mine on Williams creek, at the depth of 100 feet, is showing a fine body of ore for a distaure of seventy feet in the new drift. This proves the chute to he 200 feet in length and the vein from one to four feet wide, which will mill $15 a ton in free gold. A large Huntington mill will soon take the place of the arrastra uow in use.

The Bone of Contention has been sold to F. A. Huntington et. al. of San Francisco, who will start to work at once fitting up the eight-stamp mill with new mortars, enlarging the apron service and making such other changes and improvements as the increase of force on the mine will demand.

The Mountain Lion Co. are building a road to their new claim—the Mountain—which has encouraged its owners hy showing, at the depth of fifty feet, four feet of free-milling ore that will mill $50 to the ton. This, worked in connection with the Mountain Lion, which discloses in its lower levels two feet of even a higher grade concentrating ore, will tax the capacity of the large five-stamp plant to its utmost, though run continuously.

Rich rock has been found on the hillside below the once famous Jewett mine, which seems to he a feeder that will lead to another rich chamber of ore, like the one that was worked out in early days. The chambers have been known to occur at frequent intervals in other mines of this peculiar character, and there is no reason why this will not prove the case in the Jewett, as the development work is paying a handsome profit.

The Hammersly mine continues to contribute its usual amount to the only circulating medium. The tunnel is in a distance of 400 feet, which crosscuts three other veins besides the Little Daisy, which startled old-timers with its richness from top to hottom of the sixty-foot shaft, which is tapped by a thirty-foot upraise from the tunnel. With the exception of some ore stoped from a level with the bottom of the sixty-foot shaft on the one vein, it is still in the mine, which leaves ninety feet of ore above them.

Jackson County.

GOLD SPECIMENS.—*Tidings:* Hon. Theo. Cameron went north last evening with the mineral exhibit to the State Fair. He had with him a hundred ounces of choice specimens from Beekman & Reames' hank and fifty ounces of nuggets from the Sterling mine. Had he known it in time, he could have procured a lot of nice specimens from the Sturgis mine and from his Galice Creek mine and from many other large claims in the district. The gold which is taken out of the mines is generally shipped directly to the Mint, and unless a specimen is a curiosity in some way it is not presented. He had hut a small quartz exhihit on account of the fact that the large numher of specimens saved from the rich finds for keepsakes were crushed under the pinch of the money stringency and couverted into cash to meet current demands. The notice was too short to prepare such an exhihit as our mineral resources would warrant, but Mr. Cameron carries with him what will be likely to prove the drawing card of the pavilion.

WASHINGTON.

SQUAW CREEK DISTRICT.—Squaw Creek is situated about forty miles from Ruby, and

twelve miles from Silver, and is a tributary of the Methow. Considerable work has been done in the district, it is said the ledges are well defined, and there is hardly a prospect from which gold cannot be panned. The lack of capital however has kept the district back, but now there seems to be some effort to bring the camp out. A gold mill has recently been received and put up on the "Golden Wave." Several parties with means have paid a visit to the camp, to investigate the reported rich placers; the high water however prevented thorough exploration, although working on the high bars is carried on with a fair degree of success.

Charles Ostenberg is building another arastra which will make the third one so far erected. There is a large amount of free milling rock on the surface which can be handled successfully by this means.

BOUNDARY CREEK.—Samples of Skylark ore from the fifty foot level were assayed in Butte last week and returned 354.4 ounces of silver and $26.40 in gold per ton. The miners have broken into ore on the seventy foot level of the Providence, the average width of the rich vein being about six inches. The ore carries 1,690 ounces of silver and $6.40 in gold per ton. Work was resumed on this property a few days ago.

BRITISH COLUMBIA

KETTLE RIVER.—*Advance*: As in other mining sections of British Columbia, Americans are getting hold of all the best mineral properties in Kettle river a few exceptions, of course, excluded. We must give our neighbors across the line credit for a great deal more enterprise in mining operations than the people on the British side.

NAKUSP. *Ledger*: Wages are not as high at the Silver King mine on Toad mountain, as they are in the Slocan. Miners on that property receive $3.00, and laborers $2.50 a day.

IDAHO.

WILLOW CREEK DISTRICT.—One of the richest gold ledges ever opened up in Idaho is located in the Willow Creek district. It is at present held by D. B. Levan of Caldwell, but in view of the fact that he relocated it and that the development he has done has shown it to be of such great value, there will likely be a bitter fight before the ownership question is settled. The ledge, which is a decomposed formation, has been uncovered for a distance of 300 feet, and its average width has been found to be two and a half feet.

Chunks of the ore have been taken indiscriminately from the ledge and pounded up in a small hand mortar. In seven hours $7 in gold was cleaned up by this method. It will assay between $1500 and $2000 a ton.

Messrs. Robertson and Pritchard are running a tunnel on the Red Warrior, which will tap the ledge 300 feet deep. The tunnel is now in about 100 feet. The surface ore is free milling, assaying $40 a ton in gold.

The tunnel on the Sheldon and McDonald mine is in 130 feet. The ledge will be tapped in about 150 feet farther. The ledge is large and the ore assays from $75 to $100 a ton, the gold and silver being about equally distributed.

The district will shortly have a five-stamp mill in operation. The mill has been ordered by Mr. Carter and will soon arrive.

A move is on foot to consolidate all the principal claims in the district and sell them to San Francisco capitalists. About thirty claims are in the proposed deal.

GETTING MONOTONOUS.—*Avalanche*: Another strike in one of the Bryan groups in Owyhee was reported by telegram yesterday. This thing is getting monotonous. Those confounded tenderfeet come here and find several paying mines, while we old-timers are letting the moss grow on our backs.

MONTANA.

THE GOLDEN SUNLIGHT GROUP.—A. H. Hoadley, the original owner of the Golden Sunlight group of mines, is an old Montana miner and has been prominently identified with the mines of this State for the past seventeen years, chiefly on the Pipestone and in the Summit Valley mining district in its infancy. Two years prior to the discovery of the Hoadley group, now called the Golden Sunlight, he was working his lead properties in the vicinity of the mines which so soon made his name famous, but he became involved in litigation with the Northern Pacific Railroad Company as to its right to mineral ground, and as this was a test case it remained in the courts after having secured decisions in two other cases on appeal. Having some knowledge of the Golden Sunlight group and learning that they were owned by a miner working in the placers in the Highlands, he went there and purchased his title, and on the 25th day of March, 1890, he relocated them. From that day the property has been extensively operated upon, says the Basin *Times*.

The American Mining and Developing Company bonded the properties for $500,000. Hoadley received his $25,000 down in cash at at the expiration of his bond. The American Mining and Developing Company, in proving up the properties, sunk a shaft 200 feet and ran 1800 feet of drifts and tunnels and then made a sale of them for $500,000 to another company.

The present company is now building a 180-ton concentrator, which is fast reaching completion. It is about a mile and a half from the mine, with which the company will connect by an endless cable with buckets, and this will be the manner of transporting their ores to the concentrator.

Five cars of ore, shipped by the American Mining and Developing Company before the mine came into the hands of the present management, netted them between $600 and $700 per car, and the present company made a shipment of a number of cars that netted them handsome figures. The lead crops out prominently on the surface and can be traced a considerable distance, but in depth the pay is found in large deposits and not in regular chutes, as is found in many large mines, but more similar to the deposits found in the Alta mine near Wickes.

WAGES RAISED.—*Inter-Mountain*: The scale of wages under which the miners of Basin have been working ever since mining became an industry in that district has not been up to the union rate as paid in Butte. They have received $3.50 per day, but the carmen and shovelers got less, and on night shift they worked full ten hours with an eight-hour shift on Saturday nights. After some little discussion by the union it was decided to make a demand for a raise, which was done, and after several meetings, in which the directors of the Hope figured prominently, it has been agreed that the night shift will work but nine hours, and eight hours on Saturday nights, the day shift to continue working ten hours as usual for the seven days in a week, and all hands below are to receive the same wages of $3.50 per day.

UTAH.

BINGHAM DISTRICT.—*Tribune*: The Stewart mill, Bingham, has been closed down for a few days to clean up and make some repairs, but it will soon be in operation again. For a time it has been operated by day shift only, but the run will soon be continuous. Gold bullion has been produced right along and sent to market.

WYOMING.

WYOMING PLACERS.—Regarding the placers of Carbon county, Wyoming, and Routt county, Colorado, a newspaper correspondent speaks of large tracts that canals might cover that he knows from prospecting with a pan that would run from $3 to $10 or $12 to the cubic yard. Miners at those points say that if he had said from 10 cents to $2 or $3 to the cubic yard he would have been nearer the mark, and to do this it takes plenty of muscle and the burlap and punctured steel plate process to make it pay. Canals are being surveyed, and probably considerable work will be done on them this fall. No dry washer yet invented is of any use there. Punctured steel plates and the burlap system are the only processes that will save all the gold. The Mapleton Company had just got their works in good running order on Smoke river, below the mouth of Big Hole, when a tremendous cloudburst occurred up the gulch from which they were completely "knocked out" for the season, losing their claim and one good bar of sand and gravel that would run from 50 cents to $2 to the cubic yard. This company will resume work as soon as practicable.

ARIZONA.

SILVERY MOHAVE—Kingman *Miner*: From agent Tarr, of the Atlantic and Pacific railroad, and from the local samplers we learn that for the eight months of 1894 there has been shipped from Kingman station to eastern smelters 1436 tons of ore valued at 574,400 ounces in silver and 6464 ounces in gold. About 386,000 ounces of this amount was shipped through the two samplers here and the balance was shipped direct by the producers. Besides this there was shipped through Wells, Fargo & Co. express $7961 in gold and 23,972 ounces silver bullion. The silver bullion carried enough gold to bring its value up to one dollar per ounce. The product for the eight months is as follows, averaging silver at 63c. per ounce:

574,000 ounces silver @ 63c.	$361,620
6464 ounces gold @ $20	129,280
Gold bullion	7,961
Gold and silver bullion 23,972 oz.	23,972
Bullion sent from country by carriers	5,000
Total value in dollars	$527,934

Eighteen carloads a month from Kingman is a big showing from ore shipments these dull times and the exceeding richness of the ores make the shipments all the more remarkable. The dust sweepings at the two samplers for months past show an average value for the ores worked of 400 ounces in silver and four and a half ounces in gold per ton. Formerly these sweepings showed an average of only 132 ounces in silver and one and a half ounces in gold. The low price of silver has forced chloriders to assort their ore to a higher value than formerly, and at the same time the ore chutes are far richer than any heretofore discovered in Mohave county. Let us hear from any county in Arizona that can make a better showing than this.

COLORADO.

THE TOMBOY.—The Telluride *Journal* says that the Tomboy Mining and Milling Company shipped out a retort this week weighing over 350 ounces. This company has recently purchased a lake in Imogene basin, just across the range from Savage basin, and will put in heavy pumps and pump the water over the range and into the mill, which will be used for milling purposes. This will insure a large supply of good water all the year around, and will add much to the already valuable plant. The pumps will be operated by electricity at a nominal cost.

AMETHYST MACHINERY SHIPPED.—The machinery for the Amethyst mine at Creede to replace that destroyed by fire was bought in Leadville and has been shipped. It consists of three carloads of second-hand material secured from several closed mines in the Leadville section, besides a number of air drills and compressors used in the construction of the Busk-Ivanhoe tunnel.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

Coast Industrial Notes.

—The Parnfline Paint Co. has declared a dividend of 25 cents a share.

—The Midwinter Fair managers think they will have a financial report ready about November 1st.

—It is expected that regular trains will be running between Bonsou and Bisbee, Arizona, by the 10th of October.

—The entire Oregon wool clip for the year is estimated at 18,000,000 pounds, with a value at six cents of $1,080,000.

—The log raft at Astoria, Or., to be towed to this city, has a capacity of 7,000,000 feet logs, decked with 475,000 sawed lumber.

—Thirteen shingle mills have gone into the hands of receivers in the State of Washington this year, six burned and eight new ones built.

—At a cost of $1.09 per linear feet the Oakland Water Co. is building a 2000-foot trestle to carry its 30-inch main pipe across the low land near Alvarado.

—The *Lumberman* says there is no change in the price of logs on Puget Sound, although the demand is better than at any time during the past twelve months.

—Foreign lumber shipments from Puget Sound during August aggregated 12,482,000 feet of lumber and 1,170,000 shingles. This was the heaviest month for some time past.

—The Corvallis, Or., carriage and wagon works are to be sold to an Eastern syndicate. The local shareholders have lost $50,000 in the enterprise. It is expected the new owners will employ 100 men.

—It is asserted that a new steamship line, the vessels to be built in England and to sail under the Mexican flag, is to be established between Panama and this city to connect with the newly completed Tehuantepec railway.

—The American Pine Needle Manufacturing Company has incorporated in this city. Capital stock $1,000,000. The company will engage in the manufacture and sale of oils and extracts from native woods, use the bark of trees for manufacturing purposes, etc.

—Thirteen California redwood slabs, each nine feet wide, four feet long and five inches thick, have been shipped to England to be used in the manufacture of pianos and cabinet work. They were sent from the Occidental mill, this city.

—Another rich oil well was tapped within the limits of the city of Los Angeles this week, at a depth of 1100 feet. The present output of that particular oil field is said to be 500 barrels per day. The flow of gas from that well is the heaviest of any yet in that section.

—Lumber freights from British Columbia or Puget Sound are quoted as follows: Valparaiso, for orders, 35s; Sydney, 37s 6d; Melbourne, Adelaide or Port Pirie, 36s 3d to 37s 6d; United Kingdom, calling at Cork for orders, 45s; Shangbai, 45s asked, 42s 6d offered; Tientsin, 55s; South Africa, 60s; Noumea, 40s.

—The Monterey will not make the test of Puget Sound coal, as was intended, being unfitted for doing so satisfactorily. Using no natural draft, considerable risk would be taken of burning out the uptakes when testing. It is probable one of the Bering Sea fleet, now arriving on the Sound, will make the trial.

—The Coquille (Or.) *Herald* is reliably informed that the Bandon Canning & Mercantile Co., recently chartered and locally represented by Geo. W. and J. F. Williams and Geo. M. Dyer, of Bandon, together with some New York men, have invested $1,000,000, and have had bonded to them all the sawmills on the river from Coquille City down to Bandon, together with all their timber lands and belongings; also coal lands on both sides of the river, and intend to erect a cannery and large sawmill at Bandon.

—Extensive coal deposits have been discovered about twelve miles from Bartles, on the McCloud river, Cal., embracing ten square miles of territory. Several claims have been taken up. The coal is of a good quality. Work will be commenced immediately toward developing the new find and will consist of several tunnels and shafts. A wagon-road will be built from Bartles to the site at an early date, and if surface indications amount to anything, the coal deposits are something great. The coal is bituminous and burns very freely, having little or no shale in its composition.

—The following assessments have been levied on southern California local enterprises and fall due on the dates named: Azusa Irrigating Company, Los Angeles county, 20 cents, 20th October; Occidental Mining and Petroleum Company, Santa Barbara, 10 cents, 15th October; Lugonia Water Company, Redlands, 90 cents, 6th October; East Redlands Water Company, $3, 10th October; Crafton Water Company, Redlands, 10th October; San Felipe Land and Water Company, Los Angeles, 60 cents, 10th October.

—Charles Hansou, the president of the Tacoma Mill Co., Tacoma, Wash., says: "The men who own large timber tracts in Canada are the men who secured the removal of the $2 per 1000 duty on lumber. I have met many of them, and they have told me off and on during the past four years that it was only a matter of time when they would get this duty removed. The advantage of the foreign lumber shipper on this coast over the American is great, now that the tariff has been removed, for three reasons. the principal one of which is the ability of the foreigner to ship lumber in foreign bottoms to American ports, thus saving from $1 to $3 per thousand, according to the distance. Sailors aboard foreign ships are not as well fed or as well paid as our sailors. We pay our captains from $140 to $150 per month, while the captains aboard Norwegian ships receive from $45 to $60 per month. Their sailors receive about half as much as ours. Our men get $30 per month, and as a rule receive a pound or two of beefsteak a day, and are allowed butter with their soft bread. Their expenses being so much less, they can handle lumber cheaper. They can take lumber from British Columbia to New York or Philadelphia, while we can charter only American vessels to carry lumber to ports in our own country."

—The advisability of using steel in the construction of dams has long been urged by civil engineers, and the experiment will soon be tried in a dam across the Santa Ana river. This dam will be 100 feet high, and it is expected that it will cost about $80,000. The foundation of the dam will be made of steel tubes imbedded in the solid rock of the river. The face of the dam will be made of plates riveted together and painted to preserve them from rust. Some of the advantages which steel is claimed to have over stone masonry in the construction of dams are that it is cheaper, more quickly constructed and less liable to be injured by the effect of earthquakes. If the present experiment proves a success, steel will doubtless largely take the place of other material in the construction of dams.

—The cargo shipments from Puget Sound mills, Washington, for August aggregated 33 cargoes—19,478,585 feet of lumber; also 875 piles and 47 spars from Port Blakely mill; 709,000 lath and 55,000 pickets from the Puget Lumber Co., Port Gamble, and 732,000 lath from Tacoma Mill Co. This does not include the shipments from the Stimson Mill Co., Ballard. The lumber cargoes were shipped as follows: From the St. Paul & Tacoma Lumber Co., 3; Tacoma Mill Co., 7; Puget Mill Co., 5; Washington Mill Co., 4; Port Blakely Mill Co., 14; total 33, destined to the following ports: San Francisco, ten cargoes, 6,044,664 feet; other California ports, nine, 3,911,633; South America, seven, 5,064,288; Sydney, N. S. W., two, 1,421,000; South Africa, one, 1,880,050; Suva, Fiji, one, 517,000; Honolulu, one, 635,000; Port Pirie, Australia, one, 905,000; Mexico, one, 447,338.

Wanted!
A GOLD MINE

No properties but those which will bear strict investigation will be entertained. Parties having good gold prospects will kindly correspond with

Pacific Mining Agency and Trust Co.,

Rooms 1 and 2, Ninth Floor, Mills Building, San Francisco.

W. C. RALSTON, Secretary.

GOLD MINE
FOR SALE.

First class in every respect. Large body of ore in sight. Ten-stamp mill. Producing good profit every month. Former owner dead and heirs desire to close estate. It has a six-foot vein, $10 ore. See

J. F. CROSETT, 628 Sacramento St., S. F.

Commission Mine Broker,
628 SACRAMENTO STREET.

I have five customers looking for income-paying mines for London, to be valued from $500,000 to $5,000,000. I also want ten income-paying properties for customers residing in San Francisco, Chicago, Denver, New York and Philadelphia. Owners of mines desiring to sell can make quick sales by seeing or writing me. I also invite investors to consider properties I have to offer.

INFORMATION WANTED.

ANY ONE KNOWING THE PRESENT ADDRESS OF

MATTHEW BROWN, M. E.,

Will confer a favor on him by sending it to "INQUIRER," care MINING AND SCIENTIFIC PRESS, San Francisco, Cal.

FOR SALE.

TWO SETS KROM ROLLS, capacity 60 tons per day.
ONE IMPROVED BRUCKNER FURNACE, Revolving Screens, Self-Feeders, Rock Breaker, etc., etc.

ROOM 1. - 426 CALIFORNIA STREET, SAN FRANCISCO.

FOR SALE.
Two Mines of Free Milling Gold Ore.

For particulars address JAMES A. SCOTT, Reno, Nevada.

Electrical Progress.

C. B. SESSIONS, of the Electrical Engineering Co. of this city is putting in a big electric power plant at the Empire mine, Gold Valley, Sierra Co. It includes one 150 H. P. generator and two 60 H. P. motors, furnishiug power to an air compressor and 30-stamp mill.

During the week electric cars have begun to run on Mission street.

Adolph Sutro's proposed electrie road to the beach is taking tangible shape. The preliminary survey has been made and au easy grade determined.

Describing the electric plant at the Bodie mine, Superintendent Leggett says: "The entire cost of this plant does not exceed $38,000, while its operation during the month of October alone effected a saving of $2100, equivalent to $1.46 per ton of ore crushed, and reducing the total milling cost to $2.32 per tou; a fairly low figure for a high-priced camp (wages $4 per day) such as Bodie. At present the plant is operating most smoothly, and is successfully demoustrating the effectiveness and simplicity of the siugle-phase synchronous system for such work and distances." The daily saving ou twelve-hour runs is stated to be from $35 to $40.

The San Francisco Electric Light Co. have the contract to furuish Berkeley 50 arc lights of 2000-candle power each for $9.50 per month. The contract is for four years.

Dunsmuir & Sous, the East street coal men, are about to put in an electric coal carry from the vessel to their yard.

A big reductiou in the price of electric lights is reported from Los Angeles.

The work of cutting the electric roof wires goes on on the part of the city. Chief Sullivan says it will continue till the work is completed, or he is stopped by an injuuction. The Edison people are rearranging the wires as fast as cut. They propose to string their arc wires, the conduit system being used only for incandescent wires, any attempted application to the entire circuit resulting iu loss of current. The other two compauies are said not to possess the requisite municipal right enabliug them to place their wires on poles.

The Folsom Water Power Company expects to have considerable to do with long-distance electric power transmission in this State. It has a stone dam on the American river at Folsom 89 feet high, built of grauite. The reservoir is three miles long, holding about 13,000,000 gallons of water, supplying a canal 50x40x8 feet, with a flow per miuute of 85,000 cubic feet. With this it is expected to generate electrical power in Sacramento, nineteen miles distant. This matter of lighting the State capital has been sublet to the Sacramento Electric Power & Light Company. The canal now building will be finished in April, '95, at which time the machinery is also expected to be in place. There will be four pairs horizoutal, cylindergate special turbine wheels, having 2520 H. P., with a 55-feet head, and two electric generators, each of 1000 H. P., will be used. The engineers in charge calculate that 80 per cent of the power thus developed can be successfully transmitted to Sacramento by heavy copper wire strung on poles.

The problem of long-distance transmission of electric power has been given affirmative argumeut iu the Niagara Falls euterprise. Electrical engineers whose reputations make their opinions of value say that it is feasible to thus transmit electrical power without noticeable leakage nearly 300 miles. The cost of coal makes the question an important economic one to San Francisco. It is now confidently asserted that power can be developed at the Mt. Diablo coal miues and successfully transmitted to this city—a little over 50 miles. Cheaper still is the great unused flow of the mountain streams of the State, which on their sunny slopes have many fine sites for dams and whose course to the sea presents a great opportunity to couvert the momentum of the current into electrical power to be applied to mining. The question of successful reduction of ore is an important one to the mining interests of this State, as on the cheap processes depends largely the successful treatment of millions of tons of low-grade ore. The time when rock that ran less than $15 to the ton could not be profitably worked belongs to a past era. Electricity is the potent force that will reuder profitable many of the foothill and mountain mines uow idle.

Electricity is having considerab'e to do with a preseut proposition to vacate the San Quentin penitentiary aud consolidate that penal institution with the one at Folsom. At the latter place the State has possessory rights that give it control of good H. P. from the electric plant now being established. This is in perpetuity, and can furnish it all time, at the minimum of expense, power sufficient to light the institution, and a reserve for machinery should convict labor be utilized as proposed.

Electric Energy.

All the existing electrical conveniences supplied by wire into houses are, excepting telephonic communication, delivered as energy. If the electricity be supplied for driving a motor in the house, the performance is evidently an amount of mechanical work such as would be represented by raising a given mass of matter through a certain height, and capable, therefore, of being reckoned in foot pounds. Or, if the electricity be employed for culinary purposes in an electrie stove, the supply ean be rated at the amount of water which would be raised through a giveu range of temperature by all the heat electrically developed, this water heating being also capable of expression in terms of mechanical work. Less obviously than this, but no less certaiuly, says a writer in *Cassier's Magazine*, if the electricity be supplied to incandescent lamps, it is heat once more, expressible in foot pouuds, that is developed in the carbon filaments, raising their temperature to that of brilliant incandescence. To supply motors, stove or lamps, electric generators in the supply statious have to be revolved against magnetic forces by steam engines, and hungry furnaces under their boilers must be fed with the coal which is our present great stock of petrified solar energy. Were our methods and machinery of transformation and transmissiou ideally perfect, the sum total of all the foot pounds delivered in the houses would equal the heat known to be latent within the coal consumed. Under the best working conditions there is an enormous disparity betweeu the sides of this balance sheet. Heat streams off and leaks everywhere through boiler walls, chimneys, pipes, valves, cylinders, journals and electric wires; so that, of the theoretical energy in coal, less than ten per cent is available to the consumer in heat or motive power under the conditions of recognized good practice.

THE *Electrical Engineer* has made au investigation of the cost of installing, operating and maintaining municipal electric light plants, and concludes in favor of electric lighting by private enterprise as opposed to a city's engaging in the work of furnishing its own light. Results shown by the operation of about forty plants point to cheaper operation by private companies. When the latter are placed on a parity with the muuicipal plants as to taxation, etc., they are able to supply a town with light as cheaply as it can supply itself.

STANDARD ELECTRICAL DICTIONARY.

By Prof. T. O'CONOR SLOANE.

Author of "Arithmetic of Electricity," "Electricity Simplified," Etc.

The "Standard Electrical Dictionary" is what the work purports to be, exhausting the subject of electrical terms, giving each title the clearness of explanation necessary to make the understanding of it complete, without unnecessary elaboration. In this work every electrical word, term or phrase will be found intelligently defined.
The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the every-day electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of the greatest science of the times.

624 Pages. 350 Illustrations.
Handsomely Bound in Cloth, 8vo. PRICE, $3. Extra Super Calendered Paper.

What is said of the STANDARD ELECTRICAL DICTIONARY.

The dictionary gives evidence of a large amount of painstaking work on the part of the author, and possesses features which must be commended. Among these, the author, wherever occasion required it, has furnished the synonyms of terms, and the book is given an additional value by an alphabetical index, which enables it to be consulted for terms both collectively and individually. The work will prove of value to the reader, whether professional or non-professional. The definitions are put tersely and concisely, so that the inquiring reader can carry away a defined, net impression as to what is meant. Any student who will spend his leisure hours over the volume will be amply repaid for his time and trouble. The book is very clearly printed in bold type on good paper, and is well bound.—*N. Y. Electrical Engineer*

Practical Information.

Steamer—Fittings—Maritime Contract.

A claim for the price of a boiler and smokestack furnished in the building of a steamer before her launching is founded on a non-maritime contract, which is enforceable in the State courts, according to the decision of the Supreme Court of Michigan in the recent case of the Globe Iron Works Company vs. Ketcham. The court said: "Whatever may once have been the rule, it is now established beyond controversy that contracts for the construction of vessels and for the furnishing of materials therefor before they are launched are non-maritime, and that liens and proceedings to enforce such liens are under State control and may be enforced in State courts. The latest enunciation of the doctrine by the Supreme Court of the United States is found in the case of the J. E. Rumbell, 148 U. S. 11, 13 Sup. Ct. Rep. 498, where it is said: 'It is now settled that a contract for building a ship being a contract made on land, is not a maritime contract, and that a lien to secure it given by local statute is not a maritime lien, and cannot, therefore, be enforced in admiralty.' Many authorities are there cited and commented upon. * * * After the vessel is launched contracts for equipment or repairs or material are maritime. Before the vessel is launched they are contracts upon land and are non-maritime. The distinction is so clearly pointed out in the numerous authorities above cited, and the rule is so firmly established, that we deem further discussion unimportant. The reason for the distinction appears to be that in the former case the vessel is engaged in commerce, while in the latter case she is not, or, as stated in Lake vs. the Manhattan, 'a ship in esse as a maritime subject gives a maritime character to all transactions connected with it.'"

America's Highest Mountain.

One of the most important results of the season's work on the Alaska survey settles the fact that Mount St. Elias, so long regarded as the giant mountain of the continent, was not on American soil. It was also settled beyond dispute that the mountain was not the tallest on the continent, there being two or three others a little farther inland that out-top it by some hundreds of feet. They are all on British territory, however.

What was almost as interesting as the determination of Mount St. Elias' position, was the determination of its height. This was found to be 18,023 feet, considerably higher than the estimate given by numerous exploring parties from the Geographical Society, and others who have tried to measure the peak.

But the most astonishiug thing was the discovery of two if not three other mountaius, a few miles inland, that are higher than the famous saint's mountain. Of these, Mount Logan is 19,534 feet high, and there are two other nameless peaks that overreach Mount St. Elias by several feet. The surveying parties of the two nations at work on the boundary were mixed in each case—the English having representatives with our Coast Survey men aud the Coast Survey sending men with the English parties.

The Mackay-Bennett Cable.

The steamship "Mackay-Bennett," of the Commercial Cable Company, now in New York harbor, will lay the link which completes the new European cable. The Commercial cable is said be the greatest achievement of Mr. Mackay's life. The high rates charged by the cable monopoly led him to consider the advisability of laying another cable. The cables were foreign. Mr. Mackay decided that the United States ought to have a cable. Then Mr. Mackay and James Gordon Bennett decided to lay the new cable. Mr. Mackay placed abundant means at the disposal of the Commercial Cable Company and he and Mr. Bennett assumed all risks, and shortly the work from Norton's Point to New York city will be completed.

AUSTIN PYRITIC

SMELTER.

Any one who will read our pamphlet on this subject, sent free on request, must be convinced of the scientific merit and great industrial promise of the Austin System. It will work a revolution in ore treatment.

Bronzing Naval Guns.

When a rifle comes from the arsenal it is coated with grease to prevent rusting during transit, and this coating is kept on uutil the gun has been lifted into its carriage. The grease is then removed by washing the gun with a strong solution of potash. It is washed twice and allowed to dry thoroughly. The gun is then a glistening silver tube. The next operation, says the *Scientific Machinist*, and oue requiring more care, is the application of a mixture of sulphate of copper dissolved in sweet spirits of nitre. To an ounce of each is added a pint of distilled water. Four coats of this are applied, rubbed down hard and allowed to dry for twenty-four hours. Under this treatment the gun is transformed into a warm reddish brown without gloss. By adding arsenic to the same solution and applying again the gun assumes a darker tone. Now comes the hardest part of the work, the polishing. Boiled oil is mixed with beeswax and turpentine until comparatively thick. This is rubbed in with cotton rags at first, and then with the palm of the hand, the result being a mahogany brown tiut. The brown coat lasts remarkably well unless the gun be fired, when the heat of the discharge seriously damages the polish. The last coat is replenished about every month. There is also a process of treatment given to the gun carriages of our new crack cruisers. These carriages are cast, and it is a difficult matter to make white paint adhere to them. To obviate this, the carriages are covered with a thin layer of cement, which is polished with trowels until it is like glass, and the white paint is then applied to the smooth surface.

TUNGSTEN, which is almost as hard as steel and 50 per cent denser than lead, is beiug tried for bullets abroad, experimentally. The metal is more costly, of course, but it would have greater power of penetration. Possibly it would be producible more cheaply than at present if there were a demaud.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 20, 1894.

The sale of 10,000 tons Lake copper hy the Calumet and Hecla at 9 cents for delivery to home consumers October to December, fixes the matter of supply and demand for some time to come. Liverpool reports an advance in that as well as in other metals.

There has been a check to the recent rise in silver. It would seem as though the rise was mainly speculative, and that the China-Japan war would not exercise as huoyant an influence as was supposed. The Japanese government has borrowed at home, and seems able to carry on the contest for some time longer on its domestic resources. "As respects the rumored loan to China in Germany," says a leading authority, "its magnitude is now found to he much less than first reports represented it to he. Instead of £10,000,000, it appears that the amount really in contemplation is only £1,000,000, and it is hy no means certain that the loan will he concluded. That a syndicate of German capitalists bas offered the loan appears to he certain; that they would he glad to take it firm at a price is also understood. But that the Chinese government is prepared to accept their terms is very much doubted. China, of course, may be only haggling, She may wish to induce Europeans to believe that she is much hetter off as regards funds than she actually is, and may thus be trying to put down the terms of the lenders. But, whatever the explanation of her attitude, she does not show the eagerness to horrow which was anticipated."

At present a Japanese loan seems unlikely. Cbina has been buying ships and munitions of war. She has to pay for what she has bought, and what she horrows will be applied to making payments. If the war goes on, it is likely that both China and Japan will have to borrow. If multitudes of men are put into the field, if there is great slaughter, if costly munitions of war are destroyed at a rapid rate, then the expenditure of the helligerents, not only in Europe and America, hut in the field of operatiens, will he large, and it seems reasonahle to conclude that silver will have to he imported in considerahle amounts.

Considerable silver, chiefly in Mexican dollars, is being shipped from here to China and Japan. On the 8th went $300,000, on the 15th $525,000, and it is thought that the steamer of the 25th will take $475,000 more—$1,300,000 tbis month.

New York Prices.

Mining Share Market.

SAN FRANCISCO, Sept. 20, 1894.

No more than the usual measure of interest was manifested during the week, the leading Comstocks holding up, though not at a figure that the favorahle news from Virginia City would justify. The only stocks that seemed to respond to the reports from the mines were Chollar and Hale & Norcross, which, hy reason of reported improvement on the 450 Chollar level, sold up to 64 and 75 respectively. The Con. Cal. & Va. Co. has over $130,000 in its treasury after paying all hills, including one of the Comstock Tunnel Co. for royalties. Ophir has had considerahle attention during the week, and that fancy stock which has heen a favorite gamble for almost a generation is still depended on for a favorahle turn uow and then.

Discussing the situation, the Virginia *Enterprise* gives vent to its feelings as follows:

"Things cannot go on forever under the conditions which now exist. There must be a change for the hetter or worse before long. Ore in a mine is all well as a hase of operations on the market, hut it doesn't count for much with dealers if the stock is weighted down like lead.

"People are accustomed to ask: 'Anything new to-day from the mines?' What does it matter? News good, bad or indifferent, it is all the same in so far as it affects the market. The way Con. Virginia has acted since the recent important developments were made does not augur favorahly for any great rise in value if a strike was made of virgin gold at a point along the lode."

The Bodie Con. has declared a dividend of 25 cents per share.

The following illustrates the changes of the week:

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPTEMBER 11, 1894.

525,937.—PAPER CAN—Geo. H. Bartlett, Tiburon, Cal.

525,940.—TUBULAR BOILER—J. A. Bernard, Bakersfield, Cal.

525,837.—SELF-LOCKING NUT—A. A. Brown, S. F.

525,948.—FAUCET—C. H. Dunton, S. F.

525,706.—LIFTING JACK—E. & A. G. Hayford, Spokane, Wash.

525,984.—AMALGAMATOR—J. Jett, Walla Walla, Wash.

525,913.—HOP CLEANER—R. J. & J. P. Mackinson, Yakima, Wash.

525,958.—TUBULAR BOILER—E. L. Martin, Kern, Cal.

525,960.—HARROW—T. B. Montgomery, Benicia, Cal.

525,924.—COOKING KETTLE—Belle C. Suhin, Tacoma, Wash.

525,969.—DESULFURIZING OILS—A. Sommer, Berkeley, Cal.

525,970.—LEACHING, ETC.—Storer & Lucy, S. F.

525,875.—HOISTING DEVICE — W. E. Tretheway, Stockton, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FURNITURE CASTOR.—Siegmund Hamm, San Francisco, No. 525,496. Dated Sept. 4, 1894. This invention relates to an improvement in castors for furniture. It consists in fitting a castor with a shank which is provided with an enlarged head or fillet surrounding it near its base, and an elastic hollow so ket having separahle sides which will give to allow the fillet to pass between them, and an inwardly projecting lip at the hottom which serves to prevent the fillet or head from falling out, while allowing the shank to turn freely around within the socket or casing. Whenever the shank is to be removed from the socket it can he done hy exerting a little strength to pull it outwardly, when the sides of the casing will separate to allow it to pass. At all other times it remains in place, and will not fall out when the furniture is lifted.

CAN SOLDERING MACHINE.—Clarence M. Symonds, San Francisco. No. 525,521. Dated Sept. 4, 1894. The object of this invention is to provide an apparatus for the soldering of tubular metallic cans or similar bodies by the application of molten solder, so that it will flow by gravitation along the seam, and to thus dispense with solder baths and the appurtenances necessary to solder seams in a horizontal position. It consists ossentially in holding the can in an upright position, then applying the molten solder to the upper end of the seam and permittiug it to flow by gravitation through and along the inside and outside of the entire length of the seam and to soak into the same.

VALVE DRAIN CUP.—W. K. Conness, Sacramento, Cal. No. 525,535. Dated Sept. 4, 1894. This invention relates to a means for protecting air brake triple valve mechanism from the effects of dust and foreign substances, and more perfectly preventing the entry of such substances into the delicate mechanism of the valve. It consists of a cock or valve, the casing of which is connected with the branch pipe leading to the valve mechanism upon one side, while its opposide side forms a connection hetween the adjacent ends of the train pipe which meet therein, the cock being placed in close proximity to the passage in the casing which is in line with the train pipe passage, so that when the cock is closed its exterior wall forms approximately a portion of the wall of the passage and makes the passage continuous and practically unhroken, so as to prevent the lodgment of dirt therein.

ROTARY MOTOR.—Auguste Clement, San Francisco, Cal. No. 525,532. Dated Sept. 4, 1894. This motor is of the class in which opposite rotating pistous engage each other and are mounted within an inclosing shell or cylinder. The motor has a shell or case formed of opposing segments of different radius and curvature. There is an inlet passage at the upper end and an outlet passage opposite to it at the lower end. A pistou is mounted in the smaller segment, and is formed of oppositely radiating wings, each of which is convex near the point, concave in the hase and convex again in tbe hub. A revoluble drum is in the larger segment, said drum having recesses on diametrically opposite sides provided with convex walls to coincide with the ends of the piston wings, which are curved to make a rolling contact therewith, when they pass, while the intermediate connecting curved surfaces of the piston are adapted to conform to the convex portions of the drum with a continuous rolling coutact.

FUMIGATOR.—Herman Hoffman, of Byron, Cal. No. 525,497. Dated Sept. 4, 1894. This invention relates to that kind of animal exterminators in which a reservoir is employed to hold a volatile substance with a noxious vapor, which is generated and forced out and down into the burrow of tbe animal, hy means of a current of air from a hellows. The improvements in the present machine lie in the provision of means for ohtaining ready access to the hellows pipe and to the controlling discharge valve, whereby they may be cleaned and kept in proper working order, thereby making it a practical machine.

ELECTRO-MAGNETIC CAR BRAKE.—R. T. Murray and C. M. Allen, San Francisco. No. 525,505. Dated Sept. 4, 1894. The object of this invention is to provide a hrake in which the electro-magnet is attracted with any desired degree of force to the rails over which the car is passing, so that the friction of the brake upon the rail may he increased to any desired degree independent of the weight of the car. It consists of vertically moving shoes adapted to form a coutact with the rails, an electro-magnet which carries the hrake shoes and moves with them, a switch mechanism by wbich an electric current is caused to pass through the coils of the magnet or is cut off therefrom, and a connecting rod or lever whereby the switch is actuated at will. In conjunction with this is a movahle guard extending down in front of the car and connected with the switch-actuatiug mechanism so that the magnet is energized and the brake is automatically applied hy the contact of the guard with any obstruction.

HOSE COUPLING.—N. W. Williams, of Santa Barhara, Cal., and E. B. Seely, of San Francisco, Cal. No. 525,522. Dated Sept. 4, 1894. The object of this invention is to provide a coupling hy which the two parts of the hose may be readily and rapidly connected or disconnected. It consists of a socket portion attached to one of the ends and a coupling end attached to the opposite part of the hose adapted to enter the socket piece and abut against a washer within the socket portion, and lugs which will enter straight slots in the socket portion. A collar is fitted to the end of the socket portion having screw threads hy which it is advanced with relation to the socket portion when turned, and inclined channels made in the interior of tho collar into which the lugs on the opposite coupling end enter when they are in line with the straight slots, and the iuclined channels aro acted upon hy the lugs to rotate the collar so that the lugs are locked heneath it when the coupling end is introduced into the socket.

ELECTRO-MAGNETIC TRACTILE DEVICE.—C. M. Allen, assiguor of one-half to R. T. Murray, San Francisco. No. 525,523. Dated Sept. 4, 1894. The object of this invention is to provide a means for temporarily increasing the tractile force of the wheels of a vohicle so as to prevent them from slipping when power is applied to start the motor or train, or to climb steep grades or under any condition in which it is desirahle to increase the tractile power. This result is obtained hy the use of powerful electro-maguets so arranged with relation to the track over which the car passes that when the magnets are energized, the structure upon which they are mounted will be attracted toward the rails with a power dependent upon the magnetic strength developed, and this attraction is equivalent to the addition of a greater weight to the vehicle whereby the adhesion of the wheels is correspondingly increased.

State Mining Exhibit.

The officers of the California State Mining Exhibit have make their final reports, as follows:

FINAL REPORT OF THE FINANCE COMMITTEE.

SAN FRANCISCO, September 5, 1894.

To the Honorable Committees of the California Mining Exhibit of the Midwinter Fair:

GENTLEMEN:—Herewith please find statement of receipts and disbursements, with vouchers attached, for all moneys which have been used in our exhibit.

Our exhibit has been a grand success in every way. We started in with rather a discouraging outlook, but, as the comuittees and miners became interested, we were able to raise sufficient money to close up in good shape and have a balance of cash on hand amounting to $1500.

In the statement published in April, under the head of "Resources," you will find that we have not only equaled the amounts we expected to receive in rebates, but far exceeded them. As there has been no decision arrived at as to what should be done with any surplus we might have left, I have the following recommendation to make: Considering the fact that it was through the efforts of the California Miners' Association that the mineral exhibit was begun, and considering the fact that it is through the voluntary contribution of money from miners and mining counties that the Association exists, I would respectfully recomuend that all the surplus funds we have remaining be given by us to the California Miners' Association.

We must thank the different mine owners who so generously contributed their ore to our cause and enabled us to make such a good showing; they were more than generous.

In conclusion I will say that we have been most fortunate in sustaining no loss in any way and that our exhibit was the best mineral display ever before make of California's mineral industry and firmly believe it to be of lasting benefit to the State. Yours respectfully, EDWARD COLEMAN,
Chairman Finance Committee.

SECRETARY'S FINAL REPORT.

SAN FRANCISCO, September 5, 1894.

To the Honorable Executive Committee and the General Committee of the Mining Exhibit of the Midwinter Fair:

GENTLEMEN:—In October, 1893, it was decided to make an exhibit of the mineral industry of this State at the Midwinter Fair; it was difficult to raise money sufficient to maintain the exhibit at first, but, thanks to the energy of our committees, we were enabled to carry the exhibit to a successful close. Permit me herewith to submit for your consideration and approval my report, which embraces to a certain extent the report of the treasurer, showing receipts and disbursements in detail.

MANAGEMENT.—We were most fortunate in having had the services of E. H. Benjamin, Esq., as superintendent, he having saved us many dollars of expense, and, above all, has returned to their respective owners the thousands of dollars worth of gold specimens without a single loss.

SPACE.—To the Executive Committee of the Midwinter Fair, and particularly to Messrs. De Young, Neff and Stump, are we indebted for the gift of space.

TRANSPORTATION.—Our thanks are due to the Southern Pacific Company for their kindness in having transported, free of charge, all ore to our exhibit.

The thanks of our committee are due to Mr. A. M. Huut, the superintendent of the Mechanical Arts building, for his kind and courteous treatment and assistance in many ways. Our guards have been faithful and efficient, and have shown that our confidence in them had not been misplaced. Permit me to thank the committees for their kind consideration in many ways, and I hope my services have proved satisfatory. Yours respectfully, W. C. RALSTON, Secretary.

FINAL REPORT OF GENERAL SUPERINTENDENT.

SAN FRANCISCO, Sept. 5, 1894.

To the Executive, Finance and Advisory Committees of the California State Mining Exhibit of the California Midwinter International Exposition:

GENTLEMEN:—I beg herewith to report that all matters relating to the State Mining Exhibit have been closed and all exhibits reshipped. All claims, of every name and nature, for or against the committee, have been settled and a balance remains in the hands of the treasurer of $1500. Before closing the exhibit and milling the ores, a comprehensive collection of representative ores was donated respectively to the University of California, Berkeley, the Stanford University at Palo Alto, the Academy of Sciences and the Golden Gate Park Museum. I wish, in this report, to extend my thanks to the committee and also to the various county committees and their representatives at the fair, for their courteous treatment and able assistance. I consider that the committee is under special obligations to Mr. Johnston for the use of his excellent concentrator in our mill, as the same did splendid work and greatly facilitated the milling of our ore. Also that our thanks should be extended to the Sites Sandstone Company of Colusa county, the San Francisco Slate Company of El Dorado county and the Inyo Marble Company of Inyo county, for their able assistance in constructing magnificent exhibits free of any cost to the committee, and also to the Joshua Hendy Machine Works for the quartz mill which was operated in connection with our exhibit, and I recommend that a vote of thanks be tendered to each of them. Respectfully submitted,

EDWARD H. BENJAMIN, Gen. Supt.

The total amount received was as follows:

Contribution Account	$ 8,286.00
Rebate Account	673.91
Bullion Account	2,425.41
County Expense Account	655.85
Labor and Materiul Account	106.28
Sale of Minerals	20.10
Receipts of Lecture Anna M. Reed	12.00
Sale of Space	1,108.00
Total	$13,287.55

The total disbursements aggregated $11,787.55, leaving $1500 which was donated to the California State Miners' Association.

RUPTURE!

IT has been considered by the medical profession that hernia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

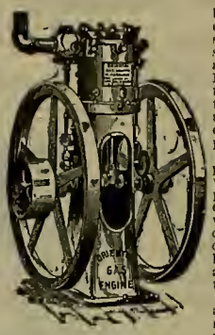
The Oriental Gas Engine



IS THE BEST because it combines simplicity of construction with power and economy of space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 150 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $5, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

Built solely by the

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,

South Milwaukee, Wis., U. S. A.

Double Acting Cornish Plunger

Pumps twice as much water as the old Cornish pump and "only one-third the weight."

SPECIAL CONSTRUCTION OF STEEL for packing on mules, only one-twelfth the weight of the ordinary Cornish Plunger.

IMPROVED SINKING PUMP.

Bucket and clack changed under water, saving expense of putting down another pump when the bucket or clack gives out under water. Bucket gearing lasts six times as long as the old gearing.

First outlay one-third less and works with ten per cent less power, "paying for itself in one or two years, according to the price of fuel."

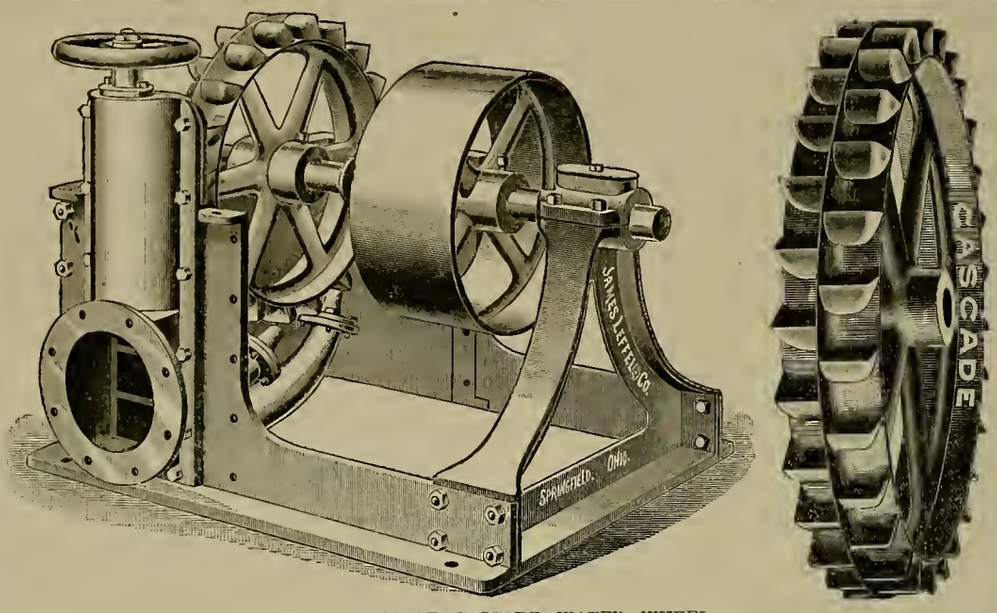
The Cascade Water Wheel.

Herewith is presented a front view of the triple-nozzle Cascade water wheel, manufactured by James Leffel & Co., Springfield, O. This new Cascade, Hurdy Gurdy, or Impulse and Reaction wheel, was patented by that company in February '91. In the illustration part of the cover is removed, showing the style and character of the runner or wheel proper, and the triple-nozzle system. Among the advantages set forth by its owners and makers in a handsomely illustrated pamphlet from which the description is reprodnced, are: There are no wearing parts except the journals of the shaft, which gnarantees durability and a minimum of cost or expense for repair. The application of the water being at one, two, or three points only, its action upon the wheel is greatly simplified, and the frictional surface of the water materially reduced. Economy in water, especially in small streams, being a matter of great importance, it is successfully secured in this type of wheel.



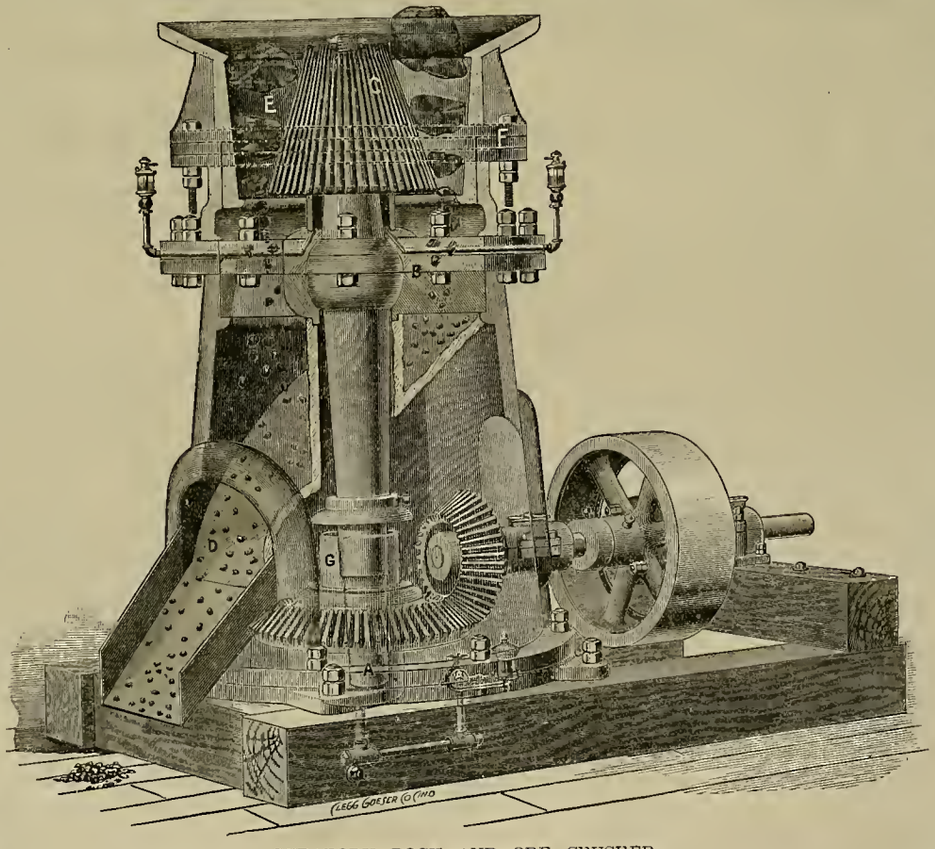
TRIPLE-NOZZLE CASCADE WATER WHEEL.

Admitting the water to wheel through one, two or more tips or nozzles, does not decrease the useful effect of water; but the percentage remains the samo, whether one or more, or a half dozen should be used. Each nozzle increases the power in the direct proportion of the increase of their number, requiring a proportional increase in the quantity of water. This is an advantage of great importanee, since there is scarcely any stream that does not vary considerably during a season. Various sizes of nozzles can be conveniently substituted at any time, to suit the changing condition of water supply at all seasons and at all stages; and, as already mentioned, with the same high economy of power.

An advantage in the nse of this wheel is its slower motion than turbines under high heads. With but slight changes or modifications, it can be adapted in size to obtain almost any required speed, it being merely a matter of diameter, number of buckets, and size of nozzle, the velocity of the wheel, of course, dependiug upon the head pressnre, and the speed upon the diameter, thus changing the number of revolutions with every change in diameter of the wheel for the same head. They are easily and frequently applied to dynamos direct without the nse of belting or gearing. This is also trne as to their application to centrifugal pumps, and occasional other machinery. A vertical gate stem and gate are used, covering two partitions between three openings or entranees of the water into the pipes and conducting it to the nozzles or discharge tips.

If it is desired to run with but one vent, nozzle or tip, the gate can be raised one-third of the distance, or to the first partition, by means of a hand wheel, which turns a screw, operating in a nnt upon the gate. If double the amount of power is required, the gate can be raised another third of the distance, embracing two-thirds of the entire opening, and stopping upon another partitiou; thus supplying auother tip or nozzle. Should a still further amount of power be desired, or three times the amount of one nozzle, or fifty per eent more than two nozzles, the gate can be run by the hand wheel, to its full height and water admitted to the third nozzle, thus affording a fnll vent or discharge of the three tips or nozzles.

It is ordinarily mounted on an iron frame, as shown in the cut, but can be placed on a wooden frame for transportation over difficult roads. With a 65-ft. head of water a 38-in. wheel makes 165 revolutions per minute, using 33⅓ cubic feet of water per minute, and giving 3⅜ H. P.



GYRATORY ROCK AND ORE CRUSHER.

Gyratory Rock and Ore Crusher.

The new ore crusher herewith shown is manufactured by the National Machinery Company, of Tiffin, Ohio. It will be observed from the engraving that the top of the hopper is entirely open, and this permits the dumping of whole carloads of stone directly into the machine.

The belt is applied to the heavy cast iron band wheel or pulley, which is attached to a brake hub by means of two common machine bolts, the brake hub only being keyed to the horizontal countershaft. The band wheel would revolve loose on the shaft were it

Economy.

Ecouomy in State government is a preseut theme. Some of our State contemporaries suggest that the State Mining Bureau should be dispensed with. It sometimes happens that the most importaut and valuable of all State expenditures are opposed by well meaning people who do not know the facts. While it is not to be denied that a better system of State economy should in some cases prevail, it would be manifestly unwise to attempt any interfereuce with an institution like the State Miuiug Bureau, which is so economically administered and which bestows a value of ten dollars to the State for every dollar expended.

Without any attempt at invidious critieism or comparison, it is believed that should the agrieultural journals that so justly call for economy and retrenchmeut feel thoroughly in earnest they can find considerable to reasonably oppose. The State appropriated $230,000 for '94–'95 for State and district agricultural societies. It is only stating a well knowu fact to say that that two hundred and thirty thousand dollars is practically wasted. The most of it goes for salaries and horse races, and the horse races are demoraliziug gambles. Horse breeding is a commendable thing, and to be eucouraged, but the way the State money is expended has, as everybody knows, no more to do with practical improvement than a stock deal has with the assay value of the ore.

The salaries of couuty officers form another suggestive theme. Immense sums can be saved in a variety of ways, but it is our belief that calm, dispassionatc, unprejudiced consideration of the facts will show that any attempt toward eurtailing the active work now iu progress in the State Mining Bureau would be a direct blow to the prosperity of the commonwealth. It is an institution that is a source of profit to the State. Eeouomy is simply the judicious expenditure of mouey. Sometimes it is economy to save five cents; other times it is economy to spend a thousand dollars. Economy is a matter of business, not of sentiment or prejudice or belief.

THE "feeder and main patent" has been declared void by the United States Circuit Court of Appeals. The result of this famous point of dispute among rival electric compauies is that any one can make and sell a dynamo or motor with the "feeder aud main" system without being held liable to infringement of special rights.

SENATOR HARRIS of Tennessee says he "would like to see an iuternational argument on the silver question." The events of the last four years furnish the most powerful argument, international or otherwise, that can be conceived, illustrating the universal need of remonetization.

The Gold Era.

The Preseott, Arizona, *Courier*, in its issue of the 21st, states that "Preseott is the gold-mining hub of North Ameriea." Similar elaims are made by enterprising eoutemporaries in New Mexico. Colorado, whieh made considerable complaint of adversity some time ago, announces in several of its journals that it "will eontest California's claims as the first gold-produeiug State." Wyoming asserts that while other States may mistakenly believe theirs to be the greatest gold produeers, the soon-to-be-developed placers in that State will show what can really be done wheu it comes to produciug the yellow metal. Reeeut discoveries in Nevada indicate great yield of gold, and Oregon papers contain credible statements showing commendable activity, though we are hardly prepared to accept the unsupported assertion in oue Webfoot journal that Oregon is par excelleuce *the* gold-produeing State of the American Uuiou. Alaska also points to its great gold producers as evideuce of its eoming prominence.

It is of interest to note the tone of confidence in whieh each seetion speaks, whieh, taken as a whole, indieates the active prosperity of the gold-miuiug iudustry iu the west half of North America. The reports, partly offieial, from South Afriea, Australia and other distant parts of the globe, show the advance of "the gold era." While it is not likely that even the most rabid monometallist who talks of "pig lead" and "pig silver" will ever be obliged to allude to "pig gold," world-wide reports show that gold production is aud promises to be abnormally large.

In this regard there is uo emulatiou or rivalry on the part of California. This commonwealth rejoiees to see sueh evidenee of richness iu its sister States aud Territories, aud would be glad to have the most sauguine statements of any and all more than verified by the facts.

Meanwhile the fact is worth noting that "what is seldom is wonderful." The gold yield of California is a steady, matter-of-fact event. Californians don't make much noise about it; indeed, the biggest gold producers in the State are rarely heard of, but it must not be supposed that beeause the sales and diseoveries and transaetions in California gold properties are not blazoued to the world, that they are unimportant. It is likely that it would be better for Californa if there were more notoriety given these things, but it goes without saying that great quautities of gold are always being produced in Californa, and the most of us let it go at that. California always was a land of marvels, and things that would sound wonderful if wired from other regions are here accepted as a matter of course. It is so with every product of the field, the forest and the mine, and has been so for so long a time that it is accepted as mueh a ease of ordinary procedure as the tides or the trade winds or the pluudering of the politicians.

But the other day, with all the prestige that transmission over the wire and fat, black type can give, came the startling allegation that one million dollars had actually beeu refused for a certaiu gold mine in a neighboring State. It uever occurred to any one in Californa to deem it of sufficient importance to souud abroad the fact that $6,000,000 had just been refused for oue of California's gold mines, that teu milliou wouldn't buy it, and that there were couuties in California from each of which over $200,000,000 in gold had been dug and which were still anuually yielding more millions. Like the big trees, the Yosemite, the climate, etc., these things we have always with us.

'93 may be considered the begiuning of the new gold era. That year this couutry produced 1,740,000 fine ounces, worth $36,000,000. Of this, Californa's credit is $13,000,000, though $15,000,000 would, probably, be nearer the facts. Iu the same time the South African Republic produeed 1,610,336 ounces. It is calculated that the total output of what our British contemporaries call "raw gold," for the current year will greatly exceed that of '93.

The Director of the Mint thiuks that the world's yield of gold for '94 will be $175,000,000. Others say $185,000,000. This is calculating that the United States will produce $45,000,000, and that Australasia aud South Africa will show au equal percentage of inerease. The one thing uow evident is that every oue engaged in its production is making an effort that, so far as he is concerned, his total output shall exceed that of auy former year.

The Geologic Survey.

Chas. D. Walcott, director of the U. S. Geological Survey, will be here next week. He has sent his secretary in advanee to purchase a campiug outfit, aud will continue a reconnaissanee he was on in 1879 when summoned by Major Powell to Arizona. He and Clarence King had worked their way eastward over the Pahranagat range nearly to Owen's lake. Now he proposes to visit that valley to quietly study some geological problems that made so deep an impression on his mind fifteeu years ago.

The survey has a good deal of work now on hand. Four field parties are now engaged in the areal survey of the coal fields of Teuuessee, Virginia, West Virginia aud Maryland; one party making a preliminary study and reconnaissauce of the gold belt of Georgia, South and North Carolina aud Virginia; one party on the southern limit of the roofiug slate belt of easteru New York; one large party on the iron ores of Northern Wisconsin; one party on the mining districts of the Helena atlas sheet of Montana; one party on the Cripple Creek gold field aud making a reconnaissanee of the Rico district of Colorado; one party completing the survey of the Leadville, Colo., district; one party surveying the coal fields of the Triuidad, El Moro and Walsenburg sheets, Colorado; one party studying the artesian water problem of the valley of the Arkansas in Colorado aud Kansas; one party engaged in the study of the water supply of the Uuited States, especially in the arid and semi-arid eentral region; oue party examiuing the clays, ete., in connection with the areal geology of ceutral Texas; one party making a reeouuaissance of the mineral belt of central Idaho; two parties eugaged in the areal mapping aud study of the gold belt of Californa; one party making an examination of the ziuc deposits of Arkansas. It is also planned to eontinue the study of the phosphate deposits of the State of Florida during the winter aud to begin the mappiug of the eoal deposits of southwest Oregon and eentral Washiugton in the spring of 1895. In addition, work on the geology of highways has been started, and the eeonomic chemieal work of the Survey is continued. To provide topographic maps for geologic work, thirty-two field parties are at work in various seetions of the eountry.

Au areal geologic map represents all that can be aseertained concerniug the various roeks within the limits of one of the atlas sheets. This information is platted upon a topographic base and shows the character of the rocks, whether they are of igneous or sedimeutary origin, mineral-bearing or otherwise, aud, in the cross structure sectious, the underground geology as far as it can be ascertained.

Mr. Walcott will be in California during the first half of Oetober, and will then go to Oregon and Idaho.

WE might as well permit our enemies to direct the movements of our armies in time of war as to permit them to direct or control our manufactures and other industries in times of peace. The present pressure illustrates the folly of Uncle Sam in assistiug his rival and creditor Johnny Bull to demonetize silver. England buys from fifty to sixty millions of silver annually to use iu her trade with India, China and other eastern countries. When our mints were open to free coinage she never bought au ounce for less than $1.29. Now she gets it for about half price. Every ounce will buy as much wheat and cotton in India as it ever would, but, the silver ounce costing less, the cost of these staples delivered in Liverpool is reduced one-half through half price silver. This regulates the priee of all wheat and cotton England buys from us, and these staples form nearly one-half of our exports.

POLITICS permeates business to an unusual extent in Colorado. The following advertisement is clipped from the advertising eolumns of the Denver *Record:*

The defeat of Waite is so well assured that investors should make haste to secure holdings in good stocks before the election of a deceut administration shall bring an advance in prices. Even the prospect of this is already beginning to have its effect in bracing the market. To clients who have deferred investing on account of our political muddle, I will say that the certainty of a change is so great as to afford good ground for buying at this time, and those who buy judiciously now will rejoice after the November election. Orders carefully filled. Prompt and full reports. ——, Mining Broker.

Concentrates.

THE *Union* says the Grass Valley Miners' Union has a membership of 700.

A 100-TON BROMINE PLANT, the Englehardt process, is being put in at Helena, Mont.

THE Anaconda Co. has bought the Poulin mine, an adjoining copper property, for $137,000.

THE Reno Borax Co. shipped a carload of borax to New York last week weighing 36,000 pounds.

WITHIN a radius of a few miles of Juneau, Alaska, 380 stamps are dropping night and day.

THE *Record* hears that the total value of the gold output of Cripple Creek will pass $5,000,000 for '94.

C. RIMBAL and D. Young have sold their mines at Sumpter, Or., to A. W. Ellis and J. F. Cupid of Pioche, Nev., for $25,000.

THE Mercur Company reports a total shipment of cyanides for the month ending September 15th amounting in value to $32,000.

THE Territorial Fair held at Albuquerque, New Mexico, awarded the Cochiti mining district first prize on gold and silver ores.

THE week's cleanup of the Ontario mine, Utah, was 25,000 ounces of fine silver. This, in the shape of 55 bars, was shipped to this city.

THIRTY MEN are employed at the New London mine near Plymouth, Cal. The Alpine mine near there has been bonded by San Francisco men.

THE Ione mine, recently acquired by the Omaha Mining Co., is to be thoroughly developed under the superintendency of Geo. Mainhart.

THERE are now, according to the official returns, 12,000 people on the Coolgardie (West Australia) gold fields. In Coolgardio itself there are about 3000.

THE *Democrat* reports the sale of the Lost Confidence mine, ten miles from Redding, to New York men who will build a big smelter and put 200 men to work.

THE Gold Cable Mining and Milling Co. of Tacoma, with mines at Anaconda, Mont., are doing development work on a 100-foot ledge of gold-bearing ore.

LAST TUESDAY the Homestake Company paid its regular monthly dividend, No. 194, of 20 cents a share, aggregating $25,000, and a total to date of $5,287,500.

G. HENDERSON, J. G. VAN MARTEN AND D. C. CALKINS have incorporated the Sammer Placer Mining Company at Virginia City, Montana. Capital stock, $100,000.

THE Centennial Eureka mine, which has been a paying proposition for over five years now, declared a double dividend last Saturday amounting to $30,000.

NEVADA COUNTY MEN are putting new machinery in the Mt. George mine, near Newtown, and propose to thoroughly develop the mine, which is a promising property.

THE receipts of the Denver mint last week were $247,319.58. The receipts for the corresponding week last year were $51,-101.24, there being an increase of $196,218.34, or about 383 per cent.

THE Parnell Mining Company has incorporated in this city. Directors—W. G. Arnold, H. B. Arnold, E. W. Arnold, R. S. Montenegro and R. W. Koch; capital stock $100,000, all subscribed.

THE Tuolumne *Independent* reports that last Monday Harry Roberts took out $5000 from his claim at Tuttletown, and that John Leachman is putting a ten-stamp mill on the old Ham & Birney mine.

SAN FRANCISCO men have paid $1,000,000 for the property of the Gold Mining and Milling Co., at Breckenridge, Colorado. The development tunnels and shafts expose ore estimated to be worth $200,000.

AFTER October 1st the petroleum refinery of the Rocky Mountain Oil Company will be closed indefinitely. This and the Standard Oil Company have for some time been warring in regard to prices.

BESIDES the Surprise gold mine in Pompton Plains, N. J., the Budd's Lake Mining Company is working a tract of alleged gold fields, and several other concerns are delving enthasiastically for precious metals in New Jersey.

AT the Broken Hill Proprietary mine, for the week ending Sept. 6, 10,912 tons of ore were treated, yielding 700 tons lead, containing 233,701 ozs. silver; also 142 tons treated by amalgamation and leaching, yielding 31,257 ozs. silver.

SENATOR JAMES HARLAN, of Mt. Pleasant, Iowa, is at the head of the syndicate which has bought the General Weaver, near Balarat, Colorado. The new company is known as the Colorado Gold Mountain Mining Company, and is capitalized for $1,500,000.

IN its annual statement the Parrot Silver and Copper Mining Co., of Montana, reports the amount of the capital stock of the corporation at $2,300,000, the whole of which has been paid in. The existing indebtedness of the corporation on June 1st was $139,717.

LEADVILLE has discovered platinum, according to recent reports from there. It came to light in assays made of Granite ore, and runs about an ounce to the ton. It cannot be successfully worked at less than two ounces to the ton. Platinum is worth about half as much as gold.

THE annual report of the Boston & Montana Mining Company is as follows: The capital stock is $3,750,000, paid in as follows: For property, $2,500,000; cash, $1,250,000. The amount of existing indebtedness, including bonded indebtedness secured by mortgage, is $1,708,374.18.

THE company which took possession of the Mountain Lion mine in Missouri Flat district last August have commenced active operations and have already worked a great change there. Men are employed in developing the property, as also a ledge which is distinct from the old one.

THE annual report of the Princeton Mining Company of Montana states the amount of capital stock is $5,000,000, paid in by purchase of property situated in Boulder district, Granite county. The amount of the existing indebtedness is $132,000 and interest, and consists of bonds of the company for $1000 each, payable on or before the 1st of January, 1891, with interest at eight per cent per annum, made to the Farmers' Loan and Trust Company of New York.

THE Gertrude, Graud View, White Elephant and Sunnyside mining properties in the Wachuca mountains, southeastern Arizona, three miles from the Mexican line, are reported sold to J. W. Pierson & Co. of this city for $27,500. A stamp mill and other machinery will be immediately put on the property.

FROM Leadville is reported the production of gold ores at over 500 tons a day, with new disclosures taking place each week along the gold belt. In addition to this, a large amount of low-grade silver ore running high in iron is being produced, and through it hundreds of miners are provided with employment.

THE New Combination gravel mine at Poormun's Gulch, two miles from Mokelumne Hill, has been bonded to a Los Angeles company. There has been considerable work done on this property by its former owners. An incline tunnel 600 feet in depth has been run, from the bottom of which a level was run 300 feet.

THE Horse Fly mine at Caribou, owned by the Canadian Pacific, produced lately 287 ounces of gold in a run of 106 hours with 900 inches of water. The Caribou mine produced 302 ounces of gold in forty-seven hours. It is now proposed to run the Horse Fly mine with 2000 inches of water and the Cariboa with 3000 inches of water.

THE Prescott, Arizona, *Courier* thinks that there is a "great deal of senseless gush on the silver question." It says that "as a matter of fact, silver and gold are of far less actual value to mankind than iron." Yet, somehow, says *Mining Industry and Tradesman*, the most of us are so perverse that we would rather have a pound of gold or a pound of silver even than a ton of iron.

THE Silverton, Col., *Standard* says: The Nevada mine, which during the past two years became so prominent as a large producer, has been sold to E. G. Stoiber, owner and operator of the Silver Lake, Rochester and several other good properties on Round mountain, Silver Lake basin, Col. The consideration must be something big, as the owners of this property last year refused $600,000 for it.

THE gold yield of Arizona for the year ending June 30, '94, was more than $2,000,000, and from the present rate of production the output for the year 1894 will reach over $4,000,000. The silver output for the same period was over $2,000,000 in value, which, had the old price prevailed, would have reached nearly $4,000,000. The copper output was over 45,000,000 pounds, and there was over 5,000,000 pounds of lead.

THE London *Mining World* of the 8th inst. reports John Hays Hammond in Mataheland, Africa, on a tour of inspection, and speaks of him as "this practical expert, without whose opinion none of the big houses in Africa or the big companies whose headquarters are here seem to touch anything connected with mining." He has so far made favorable reports on the mining properties examined in that far-off region.

THE Eagle mine at Grizzly Flat, El Dorado Co., is now being operated by the Edelman Gold Mining Company of San Francisco, which was incorporated about six weeks ago with a capital stock of $500,000. The Eagle mine is north of the Mt. Plensant mine and is on the same mineral formation. It was first worked in 1852 and is said to have produced a million of dollars by the imperfect methods of early quartz mining.

THE Commercial, Birchville, Iowa, Union and Wisconsin claims, near Graniteville, Cal., have been bought by J. E. Miller of this city and S. Fowler of Grass Valley for $25,000. The new owners intend putting up a five-stamp mill to begin with. It will have very coarse screens which will admit of the passage of ore the size of bird shot, then after leaving the battery the finely crushed rock will be put through a Huntington mill.

THE *Record* says several of the silver mines of Ouray county, Colorado, are showing an increase of gold in the ore. There has always been more or less of the yellow metal in the pay of these fissures, though it has generally been less rather than more. Of late in some of the seams there has been a complete turn about, particularly in the great Virginius vein, where at points the gold values are several times larger than the silver contents.

THE report of the Arizona Copper Company of Clifton for six months ending March 31, 1894, shows profits on copper of $23,-000; expenses, including taxes, $20,380, leaving a surplus of $5629. In addition, the profits on the company's stores were $38,650; rents, $2851, and from the railroad $50,737, making a total of $94,887. From this is deducted $54,516, required to meet interest on mortgages and debentures, leaving a net surplus from the half year's business, $40,371.

THE Montana Mining Co. report their output for August was: Gold, 2840 ozs.; and silver, 31,190 ozs. The estimated realizable value of the same is $74,900. The tonnage of ore milled during the month was 6350 tons, 110 stamps having been in operation. The expenditure was as follows: Working expenses on revenue account, $38,100; outlay on developments, $8600; extraneous expenses, including insurance, $960; on permanent improvements account, $100—$9660; total expenditure, $47,760.

ARTICLES incorporating the Mineral Hill Mining and Milling Company have been filed at Spokane, Wash. Capital stock, $300,000, in shares of $1 each. The company reserves $100,000 as treasury stock for the purpsse of development. The incorporators are: Dr. W. P. Dunlop of Alpena, Mich., and T. Ehrhart, J. F. Adams, F. L. Stutermeister, Jr., Charles Hall, R. N. McLean, W. D. Scott and C. F. Helphrey of Washington. The principal place of business will be Spokane, with a branch office at Conconnully.

THE London *Mining Journal* says: The Rand Central Ore Reduction Company has developed a new cyanide process, known as the Siemens-Halske. In the MacArthur-Forrest process the gold, after having been extracted from the tailings, is precipitated by means of zinc shavings; while under the new method the gold is deposited by electrolysis on two thin lead sheets. The process is being used at the Worcester property, where 3000 tons a month are being treated. The Reduction Company is also testing an aluminum process.

THERE is now more hard work, careful managing, better results and less money expended in mining than ever before, in Colorado, the Telluride *Republican* says. Hard times demand this method, and everyone is working for what there is in sight and yet to be found. The old-time method of mining—that is, staking claims, developing the same by wind work, placing property on sale by assay certificates—is a thing of the past. Time says this does not pay. Extensive development and continuous mill runs are the required methods of mining now. There have been more paying mines brought to light this season than there have been prospects staked.

THERE are 200 men working in the sands of the San Juan, Colorado. A man with a hand rocker made out of a candle box makes $3 to $7 a day. With improved machinery he can do much better. The gold-bearing sand extends for seveuty miles down the river from Farmington. The valley is one-eighth of a mile to one mile in width, and the sand averages fifteen feet deep. In many places it is twenty-five feet deep. The depth of fifteen feet gives 25,000 cubic yards to the acre, and, with a good process, the sand yields twenty-five to sixty cents a yard.

THE Winnemucca *Silver State* grows poetic, and says: Nature is gradually adopting the gold standard. The earth will soon be full of the glory of the goldenrod, the yellow leaves and the gold tinted daisies. But we look up and see that the heavens have adopted the silver standard. We see the silver tinted clouds, the silvery stars and the crescent moon shining like an argent on the breast of night. Earth and heaven have together adopted the double standard. Hence the man who wants the earth and expects to get to heaven must be a bimetallist.

THE Anaconda Copper Company of Montana, it is said, has no contracts for 1895 delivery, and many of the Eastern stockholders in Montana companies are earnestly hoping that this great company will suspend operations for a time at the close of the year. Should this happen, they believe they would be benefited, as the price of copper would advance to ten cents and over. The *Inter-Mountain* says there is little probability of the Anaconda closing down, except possibly for a week or so for repairs. It is known that the European bankers who contracted to supply foreign governments this year with copper are very anxious now to make contracts for similar large amounts for delivery in 1895.

AT Jackson, Amador Co., last week, the case of the Keystone Mining Co. vs. South Spring Hill Mining Co., came up. The complaint alleges that the amount of ore taken from the plaintiff's mines is 200,000 tons, and the value of the same $2,000,000, and asks judgment for the amount, also that defendant be enjoined from entering the works pending the suit, and perpetually enjoined from working the ledges and ore bodies claimed to belong to plaintiff's mines. The defendant claims that the ledges met with in the South Spring Hill are blind ledges, and have no surface croppings either within the defendant's or plaintiff's claims. That the ore bodies worked were not in the nature of defined ledges at all, but simply separate deposits.

AT Horseshoe Bend, on Salmon river, Idaho, a tract of 600 acres has been bought by J. W. Burke and O. D. Garrison of the Cœur d'Alenes. This comprises several big bars that have been worked at various times with considerable profit by different parties since first located thirty years or more ago. The only way to operate the placers to advantage is by the use of improved machinery and a complete hydraulic plant. The purchasers will adopt economical appliances and methods for working the ground on a large scale. If it is possible to ship in machinery this season, a start will be made to open the placers the present year. Otherwise, everything will be in readiness to push the work early next spring. Talk is heard of the organization of a company with a large capital to operate on the Salmon. The recent purchase is presumed to be the first move in that direction. Another big deal is pending for the transfer of a large acreage of placers on the Salmon, near Slate creek.

SAYS the Baker City, Or., *Democrat:* Win Johnson's sluice boxes were cleaned up for him by outsiders last week without his knowledge or consent, and between $1500 and $1800 in gold and quicksilver purloined. Mr. Johnson, this summer, as has been his custom, has been operating an extensive placer claim on Crane gulch, seven miles north of Granite. He employed four Chinamen to assist him. When he commenced operations three months ago he deposited fifty pounds of quicksilver at the head of the sluice box, but when he came to clean up last week he only found ten pounds. He is of the opinion that the robbery has been going on with great regularity for some time, and that the final act was committed last week. He thinks the amalgam stolen at different times was worth between $1500 and $1800. He generally cleans up about $4500 as a result of a three months' run. He will be a trifle shy this year, as the robbery knocked off some of the profits.

E. Y. NAYLOR, one of the owners of the Cozzens group of lodes on Williams' Fork, Grand county, Col., tells the *Courier* that round, water-worn quartz and granite boulders, from four to twelve inches in diameter, are found at various depths in these veins and as deep as they have been opened, or nearly 100 feet. They are sometimes found loose in beds several feet deep, and sometimes bedded in solid gangue rock. These boulders bear no resemblance to the gangue of the veins, and were undoubtedly washed into the crevices during the process of vein filling. When broken open they are found to be impregnated with the same minerals found in the adjoining gangue—silver glance, polybasite and raby silver ore. That these minerals were formed in the boulders after they had found lodgment in the veins can hardly be refuted. Such occurrences bear out the statement that mineral deposits can be formed subsequent to vein filling, and in all probability many ore deposits have been formed in that way by means of hot waters.

THE directors' July report of the Robinson (South Africa) gold mine is as follows: Quartz mined, 8657 tons. Development, 1165 feet. Average width and assay value of south reef developed during month: Width, 10 ins.; assay value, 3 ozs. 12 dwts. Mill: Stamps at work, 70; net running time, 28½ days; tons crushed, 8657; tons per stamp per diem, 4.3; gold won from above, 8555 ozs. 2 dwt. Chlorination and cyanide works: Gold won from own concentrates (by chlorination), 1102 ozs.; bullion from tailings (cyanide process), 1473 ozs. 9 dwts.; from own ore, 11,130 ozs. 11 dwts.; gold from concentrates purchased (by chlorination), 2798 ozs. 19 dwts.; total, 13,929 ozs. 10 dwts.; cash profit for month, £24,017 8s 10d. Owing to accident to rock breakers, the mill was delayed 30 hours. The August report is as follows: Mill: 70 stamps at work; 9507 tons of ore crushed. Yielded in smelted gold, 9030 ozs. From concentrates (by chlorination), 1160 ozs. From tailings (cyanide process), 1958 ozs. From own ore, 12,148 ozs. From concentrates bought (by chlorination), 2371 ozs. Total gold recovered, 14,519 ozs.

"Desert" Mines of California.

During the thirty-four years of its successful existence the MINING AND SCIENTIFIC PRESS has portrayed every nook and corner of the State and coast where mining is carried on, illustrating copiously with engravings made from actual photographs, and whether on difficult mountain sides, in the beds of streams, or by flash light, 2700 feet below the surface, the exact appearance of the scene described has been reproduced.

This week space is given to a region not usually noticed, but which is coming into prominence—that part of California generally described as "the desert." The reading matter is from a personal visit made this summer by C. F. Von Petersdorff, M. E. The illustrations are used by courtesy of Mr. G. F. Weeks of the Bakersfield, Kern Co., *Californian*. That part of "the desert" embraced in Kern county is herein referred to in speaking of the gold mining operations now going on.

The gold-bearing formation extends from the Tehachapi mountains in a northeasterly direction past El Paso peak to the Summit, and along its line mining camps have been established and claims are being worked. The principal ones are Red Rock, Black Mountain, Goler and Summit. The easiest way of reaching them is from Mojave. A stage line has been run from there to Keeler for many years over excellent roads, and the product of the various borax works is brought here on trains of especially constructed wagons, drawn by from sixteen to thirty mules.

Leaving Mojave by the Keeler stage road in a northeasterly direction, the first indications of gold mining are met with a mile and a half west of Nugent's Station, sixteen miles out, where Judge J. A. Haralson of Tehachapi has commenced work on a ledge nearly 600 feet in width, of low-grade free milling ore, assaying from $2.50 to $15 per ton—the Oasis mine.

Water has been found in neighboring gulches, and if it can be developed in sufficient quantities to justify the establishment of a quartz mill, it will prove a valuable property. The work done up to the date of Mr. Von Petersdorff's visit—June 4, 1894—consisted of two drifts run for the purpose of prospecting, one along the footwall and the other into the center of the ledge. Four miles west of the Oasis mine, and on the very summit of a high peak, J. J. McLaughlin is engaged in placer mining, and reports satisfactory returns for his labor. Three miles farther on is Red Rock mining camp, at the junction of Red Rock and Iron canyons.

Although water is quite abundant at this point, the high percentage of alkaline admixtures makes it unsuitable for drink. Drinking water is obtained at a spring a mile and a half up Red Rock canyon, where the stage company has established a station.

The mines now worked are located in Iron canyon and its tributaries. The principal ones are the Bonanza and the Success. The former is operated by a corporation which owns and controls a number of paying claims and is about to revolutionize the present method of mining with the aid of "dry washers," by the development of water and introduction of "sluicing."

A word in regard to "dry washing." The usual way of working placer deposits by means of sluices, rockers, etc., requires a sufficient and steady supply of water, which was not obtainable in this and other arid localities where gold-bearing deposits were discovered. The lack of water delayed operations for a time, until apparatus could be evolved to fill the requirements of the case; the result is the "dry washer." It is based upon the same principle as the fanning mill, which separates the grain from the chaff, with such changes as are required by the difference in the material to be handled.

Although between thirty and forty different styles of dry washers are now in use in the desert mining region, one general description will fit them all, since their difference consists merely in peculiarities of adjusting their several constituent parts, as the angle of the apron, mesh of screen, height and number of riffles, etc.

A dry washer consists of a strong wooden frame, to the bottom of which is attached a bellows, the top of which forms the riffle board, consisting of

COLONNADE ROCK—RED ROCK CANYON.

PULPIT ROCK—RED ROCK CANYON.

BONANZA MINE—IRON CANYON.

RED ROCK MINING CAMP.

WORKING A DRY WASHER.

wire netting covered by canvas, across which the riffles are nailed. Above the riffle board is the apron, and above it the screen. A simple crank and gear sets the bellows in motion, and by percussion gives a shaking movement to the apron. While one man is turning the crank another shovels the pay dirt on to the screen, through which it falls on the apron and from it on the riffle board. The intermittent blast blows the light particles of dust and sand away, while the heavier ones, and with them the gold, are caught by the riffles.

After a number of shovelfuls of dirt (from 50 to 100) have been run through the machine, the riffle board is taken out, the larger particles of gold are picked out by hand and the rest is dumped on a sheet of canvas, to be once more run through the machine at the close of day, or when a sufficient quantity of the concentrated pay dirt has been collected.

It stands to reason that such a crude method entails considerable loss, still it has been demonstrated that experienced men can save under ordinary circumstances up to 85 per cent of the gold obtained in the dirt. So-called tests made for exhibition purposes, in buildings or other sheltered spots where everything is in favor of the machine, the dirt perfectly dry, etc., giving the remarkable result of no loss whatever, are absolutely worthless, for the reason that in actual work you have frequeutly to count upon strong winds, the moisture of the soil, which causes it to form clods enclosing particles of gold which are thrown off the screen and lost, and a half-dozen other difficulties and obstacles which are met with incessantly in actual work, but are not even thought of in tests made for the purpose of showing off some particular machine.

The Bonanza mine, Red Rock, was discovered and located last October, and sold to the present owners last January, during which period between $6000 and $7000 is reported to have been extracted. Since then an equal amount has been put out. The company is now engaged in the construction of water works, the cost of which is estimated at $6000. They have ordered a pump, a 45-horse power boiler, and two miles of five-inch pipe, by means of which they expect to raise 200 gallons of water per minute during eight hours to a point 560 feet above the well, which they have begun to sink at the junction of Iron and Red Rock canyons. Should the supply of water warrant it, a second reservoir will be constructed at the height of 860 feet. The well is to be eight feet by sixteen feet in dimeusions, and will probably be twelve feet deep, at which point bedrock is expected to be struck. From the bottom of the well a tuunel will be run across the canyon, which will collect all the water running down both canyons. As there are numerous springs above the well, and the ground is wet on the bedrock all the year round, the supposition is that they will be successful in obtaiuing the water necessary for their purpose. From the reservoir into which the water will be pumped, all of the twenty-four claims of the Bonanza Company, as well as adjoiniug properties, can be supplied and worked with sluice boxes. There will be but little loss of water, as practically all of it will eventually find its way back into the well from which it is pumped.

Adjoining the Bonanza property, and to the north of it, is the Success miue. Gold was first discovered in this district on May 10, 1893, by the owners of this claim. On October 16th the first claim, the Success, was recorded. The output of this mine since then has been about $2000; that of the entire Red Rock district, $12,000.

This and a great number of other claims, which are at present worked in a somewhat desultory fashion, will be vigorously operated as soon as the water works are in shape. Even now the average output is $3 per man per day of eight working hours, and large nuggets are frequently found. The diggings worked at the present time are mostly shallow, from eighteen inches to four feet deep, aud but little ground is worked that is deeper. The deepest diggings are from fifteen to fifty feet down. In these cases drifting is resorted to.

The pay dirt consists of a mixture of gravel, sand, volcanic breccia and lava, forming a secondary wash which covers the hills and gulches for twenty miles or more and does not differ materially in the several mining camps. Huge bowlders of granite, lime, quartz, hematite, epidote, kaolin, chalcedony, testifying to the action of water, lie about in wild confusion, mixed with equally large bowlders of lava, volcanic cement, tufa and breccia. The hills which give the name to Red Rock canyon are formed of layers of white, red and gray sandstone, covered with layers of white and pink tufa and volcanic cement, the whole capped with green and black lava.

The question, "Where does the gold come from?" is not to be answered off-hand. Several theories present themselves, but none have as yet been proved absolutely and unquestiouably correct. The presence of large granite bowlders, washed sand and gravel, points to the pre-existence of an ancient mountain torrent, or possibly glacial action, while the lava, tufa and scoriæ are of more recent origin. Their flow had its source iu the Black mountain, an extinct volcano of the greatest interest to even the casual observer and much more so to the student. On its steep and rugged summit, covered with volcanic slag, lava and obsidian, may still be seen the crater, now cold and dead, but once the scene of most violent activity, belching forth masses of smoke and scoriæ, and streams of flowing lava.

As stated before, the gold-bearing formation may be traced from the summit of the Tehachapi mountains to that of the range east of El Paso peak, if not farther. Throughout this region washed bowlders, such as are ordiuarily met with in the beds of mountain streams, washed gravel and sand, are found on the highest peaks, as well as in depressions, gulches and valleys. Basing upon this the theory that we have before us an ancient river bed, the occurrence of placer gold is readily accounted for. The situation would then present itself as follows:

The bed of the aucient river was by seismic or volcanic action raised above its original level; at a later date a volcano—Black mountain—broke through it, breaking it up and scattering part of it mixed with its glowing scoriæ and lava. After this upheaval, yet another catastrophe took place and water once more gaiued its lost supremacy in consequence of a wide-reaching depression, signs of which may be observed along the southeastern slope of the Sierra Nevada and the lay of the country in general. This submersion would account for the secondary wash, composed of parts of the ancient river bed and rocks contemporary with it and the more recent volcanic products. It is a fact much commented upon by old placer miners, who, after years of experience in the northern aud central counties of Califoruia, were attracted to the new discoveries iu the desert, that part of the gold found here differs widely from that usually met with in placers, in that it has all the characteristics of having been melted. This remarkable and extraordinary fact is quite consistent with the theory advauced. When the volcauic eruption took place the intense heat melted, uot only part of the placer gold originally contained in the ancient river, but also such as was contained in bodies of auriferous ore, which, as for instance at Goler, may be observed in dead and burut-out quartz ledges.

About ten miles northwest of Red Rock canyon are the so-called Mexican mines. On two of the claims, San Francisco aud San Clemente, prospect shafts have been suuk on a ledge of considerable width. Some very rich ore was found in pockets near the surface, while the ore at a depth of thirty feet assays about $25 per tou.

The Lower Goler camp is near the moutb of Goler canyon, and the diggings are deeper than at Red Rock. Once melted, gold predominates, and it carries more silver than in the former locality. Thirty-four ounces of gold taken out of the Jackass claim contained two and a half ounces of silver.

While at the Upper Goler camp conditious similar to those at Red Rock prevail, the Lower Goler placers present a somewhat different character, there being less signs of the ancient river wash. Burned-out ledges point to the possibility that from them was derived part of the gold. The gold varies in fineness from .885 to .925, while selected lots run as high as .985. R. G. and A. F. Willard located on February 24, 1893, the Jackass claim, and average $250 per month. Their claim is up a side gulch and shallow, being from two to six feet deep. The dirt proves richer ou top than ou the bedrock.

About thirty men with eleven dry washers are engaged in mining in this canyon, aud average $3 per day, with the exception of Benson's outfit, where teu meu are at work and are said to average $10 per day.

Gold was first discovered at Goler by Ramsey Cox of San Bernardino, who was out hunting coyotes for their scalps, some time betweeu Christmas '92 and New Year '93. Sufferiug for the want of water, he went up this canyon until he found a water hole, where he horned out some of the dirt and found gold. He located a claim and called it the Horn Spoon. On his return to San Bernardino the discovery became known, and the first great rush was in February, '93. In September, '93, a nugget weighiug approximately $1000 was found on the Sau Turtle claim, which brought on a second rush to the mines during the months of September and October of that year. Since then, matters have settled dowu to a business basis and steady work.

These diggings are the most peaceable ever known; none of the usual adjuncts of mining camps, without which some people caunot imagiue them, are to be found; no saloons (with the exception of Red Rock), no gambling, no deaths by violence, no lawless element and no Chinamen—as peaceable a community and as hard working a lot of men as can be fouud anywhere.

Where the gold-bearing stratum is deep, as in the lower parts of the gulches where they open out, shafts and incliues are sunk to bedrock and the pay dirt is extracted by meaus of windlasses or wheelbarrows. Some of the works are quite deep, the deepest shaft being 174 feet down. There are in all about half a mile of drifts. Higher up the gulches, where the dirt is more shallow, dump-scrapers are employed in excavating.

The road from the Lower to the Upper Goler camp —two miles apart—is very rough and rocky. There are about twenty-five men working at the upper camp, including those iu Nugget gulch, using twelve dry washers of different patterns. At this place from fifteen to eighteen tons is considered a good day's work with the best of machines, and the average output is from $2.50 to $3 a man per day. Current wages are $2.50 per day, or $2 and board, in this as well as the other camps. Work with dry washers does not require experienced miners.

Summit, the uext mining camp, is eleven miles distant in a northeasterly direction. There is no regular camp at this place, the tents and claims being scattered over the country on both sides of the Borax road. Gold was first discovered in Summit district on December 9, 1893. There are now about thirty men at work with twelve dry washers, none of whom make less than $2 per shift, while some make a good deal more—from $6 to $10. The average is about $3, the same as the other camps. In Fairy Gulch gold is found in a hard cement of gravel, magnesia and lime, overlying which is a layer of waste from four to five feet deep.

At the Lookout claim the owners work with a dry washer of their own construction and average $8 per day. The pay dirt here is the usual volcanic wash and the gold mostly fine. There is another volcano two miles to the northeast where small rubies are found. The gold-bearing formation is very extensive, but the gold is scattered in patches and pockets. Should this territory ever become too poor for white men—that is to say, should the output sink below $1.50 or $2 per day—Chinamen will probably come in as they have done in other parts of the State.

Summit, like Lower Goler, is a dry camp, and water has to be brought from springs six miles away.

Settled Satisfactorily.

On the early train this morning W. C. Ralston Jr., president of the Osborn Hill miue, aud also secretary of the State Miners' Association, arrived in Grass Valley, the object of his visit being to iuquire into the condition of affairs as they existed at the Osborn Hill mine, and to meet a committee of the miners' union and to come to such agreements as could be mutually made. The committee from the union consisted of George Stacey, president, M. J. Owens, M. M. Mitchell, J. F. Sullivan, Philip Tresize, William Roberts, Charles Hosking and James N. Richards. The gentlemen met at the office of A. B. Dibble and talked matters over iu a quiet and peaceable manner—in fact, both sides were more than pleased, and the miners were so satisfied with the gentlemanly way and kindly spirit with which Mr. Ralston accepted their terms, that they speak with the highest appreciation of that gentleman.

On the other hand, Mr. Ralston is exceedingly well pleased with the manner in which he was received by the miners.

The meu will go to work aud pursue their avocation just the same as has always been the custom. There will be no leugtheuing of hours and no company boarding house.

The boarding house will be kept up for a time at least, and all who wish to board and lodge there can do so. No compulsion will be showu. Mr. A. H. Schnabel arrived here this moruing, and he will resume the superinteudency of the miue. The meeting to-day was full of the most harmonious feeling, and each party is glad that they have come to understand one another better.—Grass Valley Telegraph, Sept. 21st.

Monazite Mining.

Miuing for mouazite is becoming an important industry in North Carolina. The miueral is worth six cents a pound at the mines, and is purchased as rapidly as produced by the Welsbach Incandescent Light Company of New York City.

Monazite is a phosphate of cerium, lanthanum, didymium and thorium. The oxides of these rare earths are used in the Welsbach system of incandescent gas lighting, in which their properties of glowiug with great brilliancy when strongly heated is utilized.

Monazite occurs as an accessory constituent of gneissoid and granitic rocks in certain regions iu North Carolina and Brazil, and at several localities iu Europe. It is mined, however, only in the sands of streams. Iu North Carolina it occurs in considerable quantities in small, brown, greenish or yellowish browu monoclinic crystals in the gold sands. The process of securing the mineral is similar to washing for gold, monazite being very heavy, sinking to the bottom of the pan or trough, while the saud and lighter particles are washed away.

THE Atchison, Topeka & Santa Fe Railroad Company has 7125 miles of line iu operation, the Southeru Pacific 6500 miles, the Chicago, Milwaukee & St. Paul 6083, the Louisville and Nashville 4700 miles, the Northern Pacific 4400 miles, the Chicago & Northwesteru 4300 miles, the Chicago, Rock Island & Pacific 3500 miles, the Illinois Central 2900 miles, the Pennsylvania 2500 miles, the New York Central & Hudson River 2100 miles, and the Baltimore & Ohio 1000 miles.

Money.

Many Roman tin coins are known to be in existence.

The gold coins of Great Britain contain one-twelfth alloy.

From 1828 to 1845 platinum coins were minted in Russia.

The United States silver 3c piece was first coined in 1851.

The Spartans had an iron coinage, no other being allowed.

The Lydians were the first to coiu money, about B. C. 1600.

The English mint was established by Athelistane about 928.

In the tenth century there were thirty-eight mints in England.

The first coining machine was invented by Bruchner in 1553.

Aristotle says that "money exists not by nature, but by law."

The first colonial coinage was minted in Massachusetts in 1652.

The notes used by the Bauk of England cost exactly 1c each.

Julius Cæsar was the first man to put his own image on a coin.

The American cents of 1787 bore the motto "Mind Your Business."

Homer mentious brass money as in use B. C. 1184, among the Greeks.

The coinage of trade dollars began in 1874 and was discontinued in 1878.

The coinage of 20c pieces began in 1875 and was discontinued in 1878.

Brass money was coined in Rome by Servius Tullius as early as 573 B. C.

Herodotus says that Crœsus was the first sovereign to make coins of gold.

In 1503 the first English shilling was minted. It bore the King's image.

The most ancient coins are of electrum, four parts of gold to one of silver.

During the reign of Henry VIII, 23 to 25 per cent of coin metal was alloy.

Before the days of coined money the Greeks used copper nails as currency.

The first English laws against counterfeiting were issued in 1108 by Henry I.

In 1844 Napier's coin-weighing machiue was put in use in the Bank of England.

Silver was first coined in Rome in B. C. 269, when Fabius Pictor set up a mint.

The trade dollar was intended for use in commerce with China, India and Japan.

The United States mint was established in 1792 and at once began operations.

The first American coins were made iu England in 1612 for the Virginia Company.

In the fifth century before Christ refined copper was decmed as precious as gold.

Over 1000 series of Greek coins, issued by independent cities, are known to exist.

English sovereigns were first minted in 1489. They were called by various nicknames.

In 1631 the invention of milliug the edges of coins, to prevent clipping, was introduced.

At the beginning of the Christain era the relative values of gold and silver were as 1 to 9.

English coin was first made a legal tender in 1216. Before this rents had been paid in produce.

Wampum was adopted by the New England coloiusts in all their dealings with the Indians.

During the reign of Numa Pompilius, 700 B. C., an experiment was made with wooden money.

Tobacco and warehouse receipts issued after it was stored were both used in Virginia as money.

Paper money was first introduced by the notorious John Law. His issues exceeded £120,000,000.

The earliest Greck coins bore a lion or tortoise on the obverse and punch marks on the reverse.

The bronze cent aud two-cent pieces were first coined in 1864 and the nickel half-dime in 1866.

In the world's mints from 1850 to 1890 there were coined 9194 tons of gold and 81,235 tons of silver

In 1620 the first large copper coins were mined in England, putting an end to private leaden tokens.

Iu 1237 the English coined gold pennies which weighed 1-120th of a pound and passed for 20 peuce.

Vermont and Conuecticut coined coppers in 1785. New Jersey and Massachusets did the same in 1786.

In the early ycars of this century there were thirty-three tons of silver to one of gold in circulation.

From 1662 to 1690 the accounts of the New Netherlands were kept in wampum, beaver and raccoon skins.

The Romaus issued private or consular coins which bear the names of every leading Roman family.

Arabic coins have a sentencc from the Koran, and, generally, the caliph's name, but never an image.

The average life of a note of the Bank of England is a little less than 70 days. Notes are never reissued.

In 1840 Great Britain had £35,000,000 of paper money, in 1890 £39,000,000; at the former date France had £9,000,000, at the latter £115,000,000; Fustria had £80,000,000 and £123,000,000 respectively.

In 1000 ounces of our gold coinage there are 900 ounces of pure gold, 10 ounces of silver and 90 of copper.

Wheu Leyden was besieged by the Spanish army in 1574, the city government issued credit notes on leather.

The purchasing power of money in the days of the Roman Emperors was about ten times what it is at present.

During the rein of Victoria the Indian Government has coined £2,000,000 gold and £206,000,000 of silver.

The plan of a decimal coinage for the United States was suggested by Jefferson in 1785, and adopted by Congress.

According to Jacob's estimatc, the Roman Empire, in the time of Augustus, possessed £338,000 of gold and silver.

Cakes of tea in India, pieces of silk in China, salt in Abyssinia and codfish in Icelaud have all been used as money.

The early English and French kings took "moueyers" with them on their travels, who coined money as it was needed.

The American Indians used money tokeus made of coal, bone, shell, mica, cornelian, agate, gold, copper, lead and iron.

The first mention of money in the Scriptures was Abraham's purchase of a sepulcher for 400 shekels of silver, B. C. 1860.

The currency of the Argentine Republic consists altogether of paper notes, ranging in value from one cent up to $100.

A Roman mite was thirty-five hundredths of a cent; a farthing was sixty-eight hundredths; a penny 13 75c; a pound $13.75.

The famous "Wood's Money," which made so much trouble in Ireland and the colonies in 1722 and 1723, was made of pinchbeck.

Edward III ordered innkeepers to search all their guests in order that foreign mouey might not be brought into the country.

The amount of paper money issued by the revolutionary government of France between 1790 and 1796 is estimated at $9,000,000.

France has a currency of £178,000,000 gold, £150,000,000 silver, £115,000,000 paper—in all £443,000,000, or £11.3 per inhabitaut.

Among the South Sea Islanders, for a long time after their acquaintance with Europeans began, all values were expressed iu axes.

The skins of various animals passed current among the American Indians and were to a small extent adopted also by early settlers.

The continental money depreciated so greatly before the end of the Revolution that it passed current only at the rate of 1 to 40.

Germany had last year £122,000,000 gold, £45,000,000 silver, £71,000,000 paper—a total of $238,000,000, or £5 to each inhabitant.

Down to the Norman Conquest the Britons had "living money" and "dead money," the former being slaves aud cattle, the latter metal.

The United States coins fixed by Congress in 1786 were the gold eagle and half eagle, silver dollar, half dollar, quarter, dime and half dime.

Bariug says that in London during the crisis of 1847 it was found impossible to borrow any money whatever on a sum of £60,000 of silver.

During the fifty-five years ending 1890 India received and retained £442,000,000 of gold and silver, taking four times as much silver as gold.

The paper money issued by the first French Republic fell to less than one per cent. A pair of boots cost 7500 francs; a pound of butter, 750.

According to the best estimates, Great Britain has at prescnt £102,000,000 gold, £24,000,000 silver, £39,000,000 paper, a total of £163,000,000.

From 1638 to 1652 musket balls were used as currency in New England, at a valuation of a fathing apiece, and were legal tender up to one shilling.

The Roman æs, or libra, was a pound weight of copper or brass stamped by the State. It was oblong, like a brick, and was not struck, but cast.

The Director of our Mint says that the United States has $654,000,000 gold, $575,000,000 silver, $405,000,000 paper, or over $25 to each inhabitant.

Numismatists say that no human head was impressed on coius until after the death of Alexander the Great. All images before that were of deities.

The total amount of money issued by the Continental Congresses and the States to carry on the War of the Revolution was not short of $500,000,000.

Edward I forbade the circulation of foreign money in England, and established an exchange at Dover where travelers might dispose of or purchase money.

During the hundred years' war between France and England every barou in both countries claimed and exercised the right to coin what money he pleased.

During several centuries the deposits in the Bank of Venice, which were not payable, but transferable on the books of the bank, were at a premium over gold coin.

In the fifteenth century the Bishops and monasteries of Fraucc, England and Germauy did an extensive business in coining money under royal sanction.

Judas sold his master for thirty pieces of silver; that is, thirty Roman pennies, about $4.12½. One Roman pênny was a good day's wages for an agricultural laborer.

Two hundred ycars ago the West Coast Africans had a "money of account," the standard being a bar of iron, and anything supposed to equal its value was called a "bar."

In 1864 Charles II miuted tin and tried to make it pass current. After his abdication James II minted gun metal and pewter and endcavored to make purchases with the coins.

The North-English coined silver pence with a cross cut deeply into the coin, in order that it might be easily broken into halfpence and four parts (farthings) when small chauge was needed.

Madden says that in the British West Indies, two centuries ago, pins, slices of bread, pinches of snuff, drams of whisky, soap, cocoanuts, eggs and other common articles were all used as money.

A Jewish gerah was equal to 2.75c; a bekah was 27.37c; a silver shekel was 54.74c; a manch was $27.37½; a kiddar, or talent, of silver was $1642.25; a gold shekel was $8.76; a gold talent, $26,280.

The total coinage, gold and silver, of the reign of Henry III was £3898; the total coinage of the reign of Victoria up to 1892 was £544,100,000, of which £312,300,000 were gold and £231,800,000 of silver.

Precious Minerals in Siberia.

The best known part of all Siberia where precious minerals are found is the Transbaikal territory. Here, between the rivers Onou and Onou-Borza, rises the granite mountain Adun-Chilon, celebrated for the frequent discovery there of precious colored stones, such as topaz, beryl, aquamarine, Siberian topaz and others. Ou the Ouou, eighty-five versts from Nerchinsk, are found garnets in small crystals. Lapis lazuli occurs in the Baikal mountains, along the rivers Talaya and Sliudianka, flowing iuto the Baikal, and along the stream Malaya Bystraya, a tributary of the Irkut. In the latter locality lapis lazuli of good quality forms pockets in the large crystallized dolomitic limestoue, near its juuction with the syenitic granite. In the '60s pieces of lapis were worked here three poods in weight, or 108 pounds. From these deposits was obtained the lapis lazuli which served for the veneering of the columns in the St. Isaac cathedral at St. Petersburg and for the execution of a mass of artistic productions placed in the imperial palaces. In the same locality where the deposits of lapis lazuli occur, dark-red garnets are met with in crystals attaining two inches in diameter, and along the Bolshaya Bystraya amazon stone, sphene and feldspar of a crimson color are found; along the Talaya, mica, serpeutine, talc aud other minerals; along the Sliudianka, blue calcareous spar, white marble, rose-colored quartz, garnet, asphanite and others; and in the valley of the Uluntui, black mica in plates two feet in diameter. Pebbles of nephrite are found by the river Bielaya, which falls into the Angara fifty versts below Irkutsk, and along the Iret and Onou, tributaries of the Bielaya. Here pebbles of this mineral used to be found weighing as much as thirty poods. The Altai mountains, on the other hand, have become celebrated for their porphyry and jasper of various colors, which are forwarded from the Korgon ridge, from the banks of the Charysh and Alei, and from the vicinity of the Ridder mine to the Kolyvau polishing works, whence manufactured articles are dispatched over four thousand versts to the imperial court at St. Petersburg. At these works a mass of remarkable works of art have been turned out which now embellish many of the imperial palaces. Among them is the jasper vase placed in the hermitage at St. Petersburg, the oval cup which has a diameter of twenty feet. At the present time no fewer than eight quarries are being worked in the Altai, producing porphyry, blue and green jasper, granite, white and colored marbles, breccia, smoky topaz, red, rose-colored and blue quartz, agate and chalcedony.

BUSINESS is reported to be steadily improving iu the Cœur d'Alene and encouraging news comes from the mining industry in that section. The Mammoth mine at Mullan started up last week and is employing a large number of men. The Poormau at Burke is running along smoothly and makiug regular shipments. Two hundred men find employment there.

THE Cochiti, N. M., mining district is represented to possess quartz ledges fifty feet thick, assaying $40 to the ton, free-milling ore. The Spanish laud grant is a present damper to needed outlay, but it is thought the Land Court will curtail its claims next month. Bland, the metropolis of the district, is six months old and no one has beeu killed there yet.

HENRY W. LINDSAY, superintendent of the New Citizens' mine, Madera county, has been arrested at Fresno and taken to Madera on a charge of perjury in misrepresenting to Charles A. Lee of Plainfield, N. J., the output of the mine and the result of assays.

Gyratory Rock and Ore Crusher.

(*Continued from page 193.*)

not held by the two bolts to the brake hub; this is the safety device to guard against the destruction of valuable parts of the crusher by careless workmen allowing steel sledges or crowbars to drop into the hopper. Should the crushing head come in contact with anything of an unbreakable nature, the strain would become so great at the pulley that the bolts would be stripped of their threads and allow the pulley to revolve freely upon the countershaft. To the countershaft is attached the pinion which drives the large gear in the bottom, and to this large gear is attached a brass eccentric bushing, the throw of which varies from five-eighths to one inch and one-eighth, according to size of the machine. The lower end of the heavy upright shaft rests within this eccentric and gyrates with it. The upright shaft is suspended in the center by means of the ball and socket below the crushing head, the center of the ball being the fulcrum. To the top of this upright shaft is attached the crushing head, made of very hard chilled iron. As the gear wheel and eccentric revolve, the upright shaft will receive a gyratory motion (not a rotary motion), and the crushing head will then gyrate within the chilled iron liner or concave, which is fitted within the outer shell so that it may be raised or lowered by means of the jack screws on the outside of the machine. This will regulate the size of the product and also take up the wear on the head and liner.

The crushing head has the greatest motion at the top and the least motion at the bottom. This movement produces a most uniform product, spawls not being able to pass through without being broken. This crusher is adapted for fine crushing, as the crushing head can be set up very close to the inside liner or concave, there being very little motion at this point. Provision has been made for easily renewing the wearing parts. The machine is heavily built throughout and well proportioned to stand the heavy strains it is subjected to.

Advertising Catechism.

When is a good time to advertise?
Now.
When would you stop?
Never.
How much money would you expend?
A little more than you think you can spare.
Is that not putting it too strong?
No.
Why?
Because good advertising once begun increases your bank account, so that you can afford to double and treble your newspaper space.

Has not too much advertising sent many merchants to the wall?

Judicious advertising has never been the cause of a business failure, but it has been the cause of princely fortunes. Wildcat, indiscriminate advertising, coupled with loose business habits, has accompanied men into assignments. No modern store has ever made a big success that did not engage newspaper publicity.

The cross-examination is over.—Progress.

THE banks of the Payette, Idaho, are lined from Emmett on up with men rocking for gold and making from one to four dollars a day. The best dirt will be found when the river is at its lowest stage, the miners following down the receding water with their rockers. Several different kinds of rockers are used, some having copper plates, some burlaps, some blankets, etc. Like the Snake river product, the dust is so fine that considerable of it is lost. It is so light that a grain of it apparently as big as the head of a pin left in a pan to dry will float when water is poured in. A spot may prospect well this year, and be far richer or give up nothing the next. The high water deposits the lighter particles on the banks and bars, while the heavier is left here and there on the bottom of the river. It is on this theory that steam dredges were introduced on the Columbia, and their success led parties to commence preparing to give it a test at Marsh, ten miles above Emmett. The company is now hauling the lumber for the purpose of building dredges, etc. They say, however, that the ground which they recently bonded prospects well enough to justify them in taking hold without working the bottom of the river.

THE Mercur, Utah, Company has declared its regular bi-monthly dividend of $25,000, payable this month. This is the sixth dividend declared by the company, and makes an aggregate of $150,000 distributed among the stockholders. The *Record* says there is ore enough in sight in the mine to guarantee many more dividends.

THE smelters for the Boundary Creek district will be erected on the Colville reservation, on the American side, in consequence of the heavy duty on mining machinery.

Senator Jones of Nevada.

John P. Jones is attracting renewed attention by recent political utterances. He has had an interesting and prosperous career. He came here from Cleveland, O., in 1850, worked as a laborer in the custom house, then with his brother prospected along the Feather and Yuba, then turned his attention to quartz mining. During the time of his placer experiences, Jones was a resident of Marysville and his associates at a boarding-house there were Stephen J. Field, afterward Associate Justice of the Supreme Court, and George H. Gorham, for a long time Secretary of the United States Senate. In the house next to the one in which Senator Jones lived was a family named Murphy, one of whose members was a rosy-cheeked girl. Old Murphy used to correct this girl with undue harshness, until the matter became a subject of comment with the boarders next door, and one day Gorham remonstrated with the father and the old man moderated his style a little. This Murphy girl afterward married William Sharon, one of the Comstock owners, and her daughter became Lady Hesketh.

The most fortunate part of his life began when he went to Nevada to act as superintendent of the Crown Point and Kentuck mines. At that time Mackay and Fair had bought for a small sum several little mines on the Comstock, which no one thought of much value. When they struck their world-famous bonanza there he had already a bonanza in the Crown Point, and was a very rich man. The Crown Point was the southern end of the Comstock, but it was not the richest part of that lode. John W. Mackay took out $45,000,000 from the Comstock consolidation; James G. Fair's profits footed up $35,000,000, and J. C. Flood and W. S. O'Brien received $30,000,000 and $16,000,000, respectively, for their shares. Sharon made $16,000,000 in the Comstock, and W. C. Ralston and D. O. Mills made about $6,000,000 each. John P. Jones came in between the highest and the lowest of this group of Comstock millionaires. His Crown Point profits were about $10,000,000. The Senator has always been of a speculative turn of mind, and he took his big profits in Crown Point and invested them in other properties. The result was that he lost his first fortune very quickly. But he had retained his control of the Crown Point mine, and he soon took enough out of that to put him on his feet again. He had made and lost two fortunes, when he was elected to the Senate, in 1873, and he was then reputed to be worth $5,000,000. Five years later—in June, 1878—he was virtually a pauper by speculation. He owned any quantity of mining property in Sierra Nevada, but it was thought to be exhausted. No gold had ever been found in these mines below the 1800-foot level, and the general belief was that none was to be found. Harry Jones, the Senator's brother, now dead, had faith in the lower workings, and he went down to the 2100-foot level. His persistence was rewarded by the discovery of a vein of gold richer than any the mine had shown. The find was made in September, 1878, and the Senator's stock, which had been knocking about the New York market, a football for the brokers at $4 a share, suddenly jumped to $220—an astonishing advance. The new find made the Senator again a rich man. He then acquired a large interest in some gold mines on Douglass Island, Alaska, and when his Nevada property gave out again he found another fortune in the Alaska venture. His income from his Alaska investments was said at the time to be $12,000 a month.

WM. A. G. BIRKIN and Frank A. Youd, English mining operators, left this week for Loudon, after closing a mining deal with our townsman, M. M. Freed, for a group of gold properties, situated on the Big Hole river, in Madison county, about twelve miles from Melrose, says the Dillon (Mont.) *Tribune*. The price agreed upon is $425,000. The first payment of $20,000 is due in thirty days. One of the points in the agreement is that a forty-stamp mill be immediately erected upon the property and that $100,000 be expended in development work, which shall include the erection of mills and their equipment with machinery, electric light plant and all other necessary buildings. This is one of the largest mining deals ever consummated in Montana. It has been developing for nearly a year, and most of the negotiations were carried on by cable, one of the minor items in the matter being a bill of $1500 for cablegrams alone. Messrs. Birkin and Youd, who looked after the English end of the bargain, represent one of the richest mining syndicates in England. The title of the new company is the Madison County Gold Mining Company, Limited.

GOLD is reported to be plentiful on the Fraser this season, in consequence of the recent floods. Hundreds of Chinamen are washing the bars, and an attack of gold fever has sent several men from New Westminster up the river.

MR. CREEDE is reported to have sold the remainder of his interests in the Creede, Col., mining properties to D. H. Moffat for $5,000,000.

Copper in Idaho.

In a short time Custer county will be producing copper bullion, says the Challis *Messenger*. W. A. Clark, the great Montana mining man, has secured 51 per cent of the stock of the Idaho Copper Company, whose property is located near Huston, on Lost river, Frank Brown holding the remainder and continuing as superintendent of the property.

A forty-ton smelter will be running in about thirty days, and if the results are as anticipated a great plant will be put in. The company has given orders for transportation of coke and is making every preparation for a run.

This copper vein is sixty-five feet wide and is known as the big copper. There is said to be enough good ore in sight to run a forty-ton smelter for two years. A shaft is to be sunk on the vein at once to the depth of 300 feet. In addition a tunnel will be started on the other side of the hill following the vein in. This tunnel will be 3000 feet long and will open the vein at great depth. The ore carries from $8 to $10 in silver per ton and some gold.

All the old producing mines on the South Fork and its tributaries, except the Hunter, Morning, Black Bear, Custer, Sierra Nevada, Last Chance and Stemwinder, are working. They employ something like 1000 men underground and in the mills, divided as follows: Bunker Hill and Sullivan, 350; Poorman, 200; Gem, 255; Frisco, 120; Tiger, 80; Standard, 45; and Mammoth, 20. The Morning was to start up on the 1st. This would give employment to another 100 men underground and in the mill. The Hunter will also start up. There is some talk of the Custer also being again put in shape. The California on Nine Mile, near Menarch, is shipping ore under lease. This mine was a steady producer in the early days of the camp. The resumption appears to be permanent, and several pay days will promote good feeling and business enterprise among all classes. No county in Idaho ought to show more prosperity than Shoshone, better known as the Coeur d'Alenes.

J. D. HELM came in yesterday from the Vulture, says the *Courier*, where he has for some time past been successfully working the tailings of that old mine. Mr. Helm confirms the report of the rich gold strike below the site of the lower Walnut Grove dam. The strike was made by a Mexican. The mine is developed by a hole only four feet deep, exposing a ledge two feet in width. Nuggets of pure gold have been taken from the ledge, ranging in value from $30 to $200 each. The rock is fabulously rich. The hole is guarded day and night. The claim takes in a side gulch, in which the Mexican allowed a few of his relatives to try their hands at placer mining, and they in a short time took out several thousand dollars in handsome gold nuggets, and are now on a glorious drunk.

PRES'T COMSTOCK AND PROF. FORBES of the University of Arizona are geologically inspecting central and northern Arizona and tracing the mineral-bearing reefs that traverse the Territory from northwest to southwest, especially the barrier reef, of which the Mogollon rim is a part, and which serves to separate Arizona into two well-defined regions of low land and elevated plain. The result of these investigations will be compiled and published next winter.

THE smelter on the Big Bug mine, Arizona, owned by the Commercial Mining Company, is to be moved to the vicinity of the Senator property, on the Hassayampa, to treat the rebellious ores of that mine and do custom work. The plant is a big one and will entail much expense in its removal.

Personal.

W. A. KENT is the new chief engineer at the Anaconda and Syndicate, Montana.

JOHN FORD succeeds Heber Holman as foreman of the Gould & Curry and Best & Belcher mines.

CHAS. MCCREARY, an old and well-known mining man, passed away at Sacramento last Saturday.

MAURICE CLARK left here last Thursday to superintend smelting operations at the Malacate mine, Sultipec, Mexico.

MR. JENNINGS, of present prominence in South African mining enterprises, has temporarily returned from that country.

ISAAC HAZELGROVE, who has been prospecting in Calaveras Co. for a year, has returned to Salt Lake to enlist Utah capital.

CHARLES D. WALCOTT, the head of the United States Geological Survey, is now in Colorado overseeing the work that the Government has in hand there. He was tendered a reception by the Colorado Scientific Society at Denver last week.

Obituary.

HALSTEAD STANSFIELD SR., head assayer at the Treadwell mine, Alaska, died there on the 12th.

Scientific Progress.

The Pacific Cable.

During a recent visit to Canada Alexander Siemens gave to the press complete figures of the estimated cost, operating expenses and probable income for the Pacific cable connecting Canada and Australasia, which formed one of the objects of the Intercolonial Conference at Ottawa. The figures given have all the weight of Mr. Siemen's great authority in cable construction and the endorsemeut of other cable experts, and may be accepted as correct. It is seldom that complete figures on cable work are made public, and apart from the maiu result sbown hy the balance sheet, the details, of wbicb the bulk items are composed, reveal mauy interesting facts. The total length of the cable, about 8420 statute miles, would average $1000 per mile, of which the deep-sea portion would cost $1500 per mile and cable for sballower water $870 per mile. Two repairing steamers would be required, costing $500,000 each. Between New Zealand and Vancouver the cable would he landed at three islands, dividing it into four working sections, and the instruments and buildings for the staff would cost $150,000. The staff and office expenses at these five stations vary from $10,000 per annum at Vancouver to $30,000 per annum at Neckar and Canton Islands, where the employes have to be boarded and lodged, and in addition receive fifty per cent larger salaries, these islands heing mere rocks in the ocean, and, as Mr. Siemens mildly expresses it, "very undesirahle habitations." The chief items of repairs and renewals are 200 miles of cahle replaced per annum and tbe cost of maintaining tbe two repairing ships. Each vessel costs $3500 a month to keep it lying in port ready for business, and an additional $500 per day when it is actually at sea and at work, which it is estimated will he for ahout two months in the year. On one point no informatiou is giveu, and that is during what portion of the four months' cruising of the repairing steamers cahle communication would be actually interrupted, which would mean irretrievable loss to the revenue. The cruising time, no doubt, includes carrying supplies to stations, and if a fault develops gradually the cable steamers may be able to reach the spot, grapple and splice without any actual interruption, but with a sudden ground it might require more than a week to reach the spot.

Air Frozen Solid.

Prof. Dewar is attracting world-wide attention hy his remarkable series of successful experiments, in the Royal Institution lahoratory, where he has liquefied oxygen, solidified nitrogen and reduced air to a frozen solid at a temperature of 346° Fahr. below zero.

For years frozen carhonic acid was the limit in extraordiuarily low temperature, hut Prof. Dewar hegins where some of his predecessors ended in tbat journey toward "the absolute zero" that has so long heen looked forward to by explorers iu this department of science. Hydrogen is still successfully repellent to all efforts at the solidificatiou of that lightest of all gases. A generation ago Faraday advanced the theory tbat hydrogen was metallic. It has many characteristics that accord witb that tbeory. Tbe other theory that all metals are finally resolvahle into hydrogen, and tbat hydrogen is the one simple element, does not meet with any present favor witb scientists.

Cost of Salvage.

Enormous sums have beeu paid as salvage to the rescuers of ocean steamers when they are disabled at sea, and probably this is a more fruitful source of expense to the large companies than any other. On her first voyage the City of New York (as she was then called) ran ashore off Sandy Hook, and it cost the company $100,000 to float her off. In 1890 her sister ship, tbe City of Paris, broke her engines off tbe Irish coast, and was towed into port at an expense of $30,000 as salvage money. The City of Boston broke her sbaft in 1882, and it cost the company $46,500 to get her into port; and the Venezuela, of the Red D line, struck ou the Brigantine shoals off New Jersey in 1889, so that the company had to spend $40,000 to get her off. Tbe City of Richmond was towed into Halifax harbor in 1882 at an expense of $35,000.

The list could he largely extended, sbowing that the amount of salvage money paid for rendering services to disabled steamers at sea is so enormous that it almost equals tbe loss entailed by injuries to our woodeu vessels. The loss of life is less. It is quite rare that au ocean steamer is suhmerged beneath the waves so that the crew and passengers are lost, but when such an accident does transpire the destruction is appalling.

Lost Anchors.

Oue of the queer occupations of mankind is that of dragging for lost anchors. It is carried on iu hays and rivers, and even in the open sea along the coast. Several sloops and schooners are engaged almost exclusively iu this pursuit. The hunters are as familiar with the ground wbere anchors are to be found as fishermen are with the favorite haunts of the living inhahitants of the sea. On the Atlantic coast the stretch of sea off the Delaware breakwater is most fruitful in dropped anchors. This is owing to the fact tbat so many vessels are compelled by tbe state of the tide to ride off the breakwater, being oftcn caught in gales while stationed there. Tbe manner of fishing for lost anchors is most simple. A chain is let down in a loop long euough to drag along the bottom, and the vessel goes on her way witb all hauds on board alert for a bite, and a hite usually euds in a catch. The recovered anchors are usually sold again at a price of ahout four cents a pound, which is one cent under the market price for new anchors. A hig auchor will weigh 6000 pounds, so tbat tbe fishermen make $240 out of it. More ofteu, however, the anchors fished up weigh from 1000 to 2000 pounds, and there is a pretty profit in the business even then.

A NAVAL CORRESPONDENT who was present at a demonstration in England of the powers of the improved Maxim gun, speaks of it as being "a terrible exhihitiou of the murderous power of the new weapons." The storm of hullets from them cut the water like the rain on the advaucing edge of a tropical storm. With one of those guns a gunner of very moderate skill can at 500 yards range cut down an ordinary park paling almost as neatly as a workmau can do the husiness on the spot with an ax, and it is not, therefore, astonishing that the targets, small though they were, quickly "disappeared." Though be had heen present at every naval gunnery demonstration for many years, he had never seen such splendid shooting. He adds: "To the horrihle noise made hy a Maxim I know of nothiug that is comparable, except, perhaps, the sound made by steam blowing off at enormous pressure from the safety valve of a hig hoiler. Tbe water in tbe jackets of the barrels of the guns quickly hoiled, and the redundant steam was almost as conspicuous as the smoke from the discbarges."

THE JONES ROCK DRILL
IS THE
Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should he in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

Mechanical Progress.

Aluminum by a New Method.

Aluminum, when it once forms an alliance with oxygen, is not so easily separated from it as most metals. An ore consisting mainly of oxide of iron may be burned in a furnace with charcoal, the carbon taking the oxygen out of the mineral, leaving a practically pure metal. Aluminum, too, is obtained for commercial purposes from an oxide (alumina); but that oxide cannot be reduced in an ordinary smelting furnace in the same way. The heat of an electric arc is necessary to effect the divorce. One of the best known methods of procuring the metal is to dissolve the alumina (in the form of purified beauxite, which is a hydrated oxide) in a bath of molten cryolite, just as sugar might be dissolved in water. The mixture is contained in an iron pot with a carbon lining; and this carbon is suitably connected with a copper conductor leading from a positive pole to a powerful dynamo. To complete the electric circuit cylinders of carbon, similarly connected with the negative pole, are immersed in the bath. The melted alumina is then gradually resolved, the oxygen going to the carbon cylinder, combining with it, forming carbonic acid gas, and escaping; and the pure metal sinking to the bottom of the bath. The process is continuous, more beauxite being dropped into the pot when the first lot is "reduced." Cryolite will hold in solution about 25 per cent of alumina, so that a larger charge than this cannot be worked at one time.

A new process is now reported from Neuhausen, Switzerland, one of the few foreign centers of aluminum production. It is proposed by a well known company in that town, already engaged in this industry. Electrolysis is again resorted to, but the particular mineral operated upon is a sulphide. The oxide is first converted into that salt, or rather into a double sulphide of aluminum and some alkaline metals like sodium. This particular combination is effected by heating alumina, carbon and sulpbide of sodium together. A bath of potassium and sodium chlorides, melted by external heat, is found preferable to one of cryolite for this process. It is claimed that less current is required to electrolyze this salt than beauxite; and as the cost of aluminum is really controlled by the cost of the electricity consumed in the operation, even the slightest gain in this respect is highly desirable.

Engineering Economies.

The great names which have adorned the history of engineering were of those who, having the constructive faculty largely developed, built, as best they could, that which was required of them, often insecure, often crude, often abnormally expensive, and yet often better than they knew. To these men the problem was not so much what a structure would cost, but to build a bridge which would not fall down, a dock which would stand the buffets of ships and waves, a structure which would be enduring and serviceable alike. How well they have succeeded the monuments which they have left to us attest.

"It is with all reverence and humility," says a well-known writer, "that one should speak of those who, by the boldness of their genius, astonished the world, and who set an example of problems solved and work done with facilities sufficiently inadequate to daunt the boldest at the present day. To these men," he says, "the certainty and accuracy of their calculations as to the strength of a beam was of far more importance than its cost; the strength and distribution of the strains of a bridge were of far more moment than the relative economy of different styles of trusses."

To-day we are met by an entirely different set of conditions. One can buy, by the yard, strain sheets of bridges, roofs and other framed structures of all kinds and for all conditions of service; for a few dollars a full set of designs can be had for different types of locomotives; the strength of materials bas been carefully worked out, and books can be had for the asking, giving the strength of beams, girders, etc.; the efficiency of prime movers has been carefully determined, and the data thereon can be readily obtained. One does not now design a turbine wheel or a steam engine unless directly in that business, although one may thoroughly understand the subject; but, looking up the result of tests, one selects the engine best adapted to the work to be done, and goes to the manufacturer for the outfit complete. The question now asked is, not if a process can be devised for accomplishing certain results, but which of a number of methods is the best, and by the best is meant the most economical. Many an elaborate plan and many a well-laid scheme bas fallen because of the commercial element having been entirely neglected or not thoroughly understood.

Restoring Strength to Iron.

Some time ago a railroad bought six new switching engines that were put into the same hard service in a yard where there was a great deal of running over switches and frogs that subjected the running gear to severe shocks. The engines were all of the same pattern, strongly built, with unusually heavy axles, the designer believing in a good margin of strength. After these engines had been in service for several years, one of them broke an axle. An inspection of the fracture showed that what was originally fine fibrous iron had become coarsely crystalline, the molecular change, no doubt, having been induced by the constant jars. Within six months all the six engines failed with broken axles, and the fracture in each instance showed the same condition of the iron. The superintendent of motive power of the company, when the breakages happened, believed that reworking restored the strength to iron that had become weakened through use. He determined to put the theory to a practical test, so he worked up the broken axles into piston rods, crank pins, rod straps and other parts of locomotives that are subject to severe and complex strains. The metal was found to give excellent service.

To Desulphurize Iron.

The Saniter desulphurizing process is making headway in Europe. During 1893 some 16,000 tons of iron and steel were desulphurized by its agency in England, the economy obtained being satisfactory. Krupp & Co. of Essen have now taken up the process for the whole of Germany, after making an extended trial of it at their Westphalian works. It is considered that the application of desulphurizing, in conjunction with the basic process, will bave considerable influence on the iron trade by enabling the impure native ores to be utilized to a larger extent than they are at present. All three applications of the Saniter process are now regularly at work, and with satisfactory results. The ladle process for desulphurizing crude iron, by which iron containing up to thirty per cent of sulphur can be dealt with, has, after two years experience, been so perfected as to give great regularity of results at a very low cost, and, it is added, basic iron is being manufactured by this means, and without the use of manganiferous ores from tap cinder.

THE final patents on the basic steel process will soon expire; the world will then be at liberty to use it without paying royalty. It is estimated that the process bas yielded to the owners of the original patents more than $750,000 in Great Britain alone.

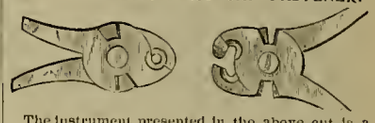
GIANT POWDER FURE CAP FASTENER.


The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.
MOONEY & SHERWOOD Fresno, Cal.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—GOLD AND SILVER ORES.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes wherof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.
This work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:—Preface; Introduction; Implements: Assay Balance; Materials: The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging: Assay Litharge; Systems of the Crucible Assay: Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead: Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price $1.00 postpaid. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
SECOND EDITION—PRICE $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.
Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

Send for free circulars of information. No. 220 Market St., San Francisco, Cal.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MINING NOTES.—*Ledger:* Timbers are being hauled to the Good Hope mine property to commence development work.

J. L. Sargent started up the Farrell mill on rock he and his partner took out of the Farrell mine during the past month.

There are three men at work on the Bright mine cleaning out the old shaft and getting ready to begin work for the new company which was recently promoted by the Reichlings.

John M. Wilson has resumed work on his mine near Drytown. The shaft is down sixty feet and everything is in first-class condition. Mr. Wilson has equipped the property in a first-class manner with a steam hoist and will push work as rapidly as possible.

El Dorado.

TEXAS HILL.—*Democrat:* At the Try Again mine an upraise has been made from their tunnel for air.

At the Deep Gravel mine a winze 98 feet deep is about completed to strike a body of rich gravel known to exist there.

At the Varozza mine rapid progress is being made with the tunnel.

The Olive claim is now producing richer gravel than has ever before been taken from that mine. The body of gravel increases in extent and richness as the work advances into the hill. The mill is kept running most of the time.

The Tockey mine is being worked regularly in good paying gravel, the bed being six feet thick. A mill is needed at this mine, as it is almost impossible to obtain the gold by sluice-washing.

Reed & Coffin have completed an air drift, and are now ready to take out gravel.

Los Angeles.

TO HAVE A SMELTER.—*Herald:* Los Angeles will have a smelter. Of this there is no longer a doubt. The partially constructed building, furnace and the like on the east bank of the Los Angeles river will be completed between now and the first of January. The company will be composed of Arizona mining men and Eastern capitalists. It will have a capacity of 400 to 500 tons a day, and the same ores that are treated at Denver and Pueblo will be treated here.

Mariposa.

Gazette: New mines are being located every week, and properties change hands or are bonded equally as often. It is upwards of twenty years since Mariposa has had as bright an outlook as she has now. If every citizen will stand in loyalty and, by speaking a good word for their county, encourage new people to come and farm our lands, work our mines and convert our forests into marketable lumber, our prosperity will rapidly increase, and we will soon rank among the leading counties of the State.

Merced *Star:*—The English syndicate who recently purchased the mining property at Whitlocks have announced their willingness to purchase power from the Yosemite railroad, and if the power is furnished, to erect a 500 stamp mill. The proprietors of the Cook mines and other mining properties in Mariposa county are also of the same mind. Mr. Wulkop and Mr. Hall are now in San Francisco in consultation with a number of people who are interested in seeing the railroad built.

Placer.

Sentinel:—A new quartz mine has been opened down in Rattlesnake district. A Y tunnel of 400 feet has been run by Porterfield & Zantgraf, which has tapped a fine ledge running parallel with the famous Zantgraf mine. A tramway has been built leading to the Zantgraf mill, and the work of taking out ore has been commenced.

At the Zantgraf quartz mine they are busy with further development and improvement of the mine. We understand that as soon as operations at Mammoth Bar close for the winter, water can be secured to run the Zantgraf mill. The Mammoth Bar is taking 500 inches of water.

Nevada.

RICH PROSPECT.—*Transcript:* Henry Trevaskis, at Indian Flat, has been running a tunnel into Red Hill for the purpose of striking a quartz ledge. After running 200 feet and not finding anything, he quit the tunnel and began sinking a shaft. After getting down about twenty feet he struck a small vein of decomposed quartz, of a reddish color, through which there was a narrow streak of very rich quartz. Trevaskis has been pounding up this rich rock in a hand mortar and in this way has made good wages. The other part of the ledge matter he threw to one side, not considering it worth working.

The other day George B. Treadwell, the well-known mining expert, stopped at Trevaskis' mine to see what prospects the former was meeting with. He noticed the red rock that Trevaskis had thrown away, and upon looking at it carefully gave it as his opinion that it would be a good idea to have it worked. The quartz contains considerable oxide of iron. Mr. Treadwell took a sample of the poorest of this quartz and sent it to his son in Amador county to be assayed. This morning he received a letter containing the result of the test, and also the gold button. The rock assayed $4,574.10 a ton. Were it not for the pockety nature of that section, moneyed companies would quickly take hold of this prospect. As he is working it Trevaskis is doing very well, and may develop a rich and permanent mine.

CONTEMPLATED SALE.—*Union:* It is expected that the Belle of France mine, which is situated near the North Star mine, will soon change hands. A number of capitalists have of late been examining the property. The Belle of France gives indications of becoming a good mine. An amalgamation assay of twelve pounds of the ore assayed $16.50 per ton, and the dirt and decomposed quartz from the hanging wall gave a return of $23 per ton. Walter W. Byrne, who is interested in the Belle of France and extensions, received a letter Friday from Messrs. Lane & Hayward's mining expert saying that he would be here in a few days to examine the mine for his company. Monday six men will start to work and run drifts, and take out 100 tons of ore for a mill test.

Trinity.

Journal:—Rouse, King & Co., have obtained the contract to widen the Canon creek ditch on the Hayes Mine at Junction City and also to build new flumes. They will begin work next Monday, and will employ a force of about 100 men.

The lessees of the Chloride mine on Canon creek have struck a two-foot ledge that will mill $25 a ton. The new strike is west of the old pay chute on the mine and promises to be more extensive than it. At present the mill is not running owing to the scarcity of water but will start as soon at the fall rains begin.

NEVADA.

THE ZIRN-SCHULTZ STRIKE.—Belmont *Courier:* Everybody is excited over the recent strike in the Zirn-Schultz mine in Pine Nut and many people from Genoa and Carson, and a few from a distance, have visited the mine. All who have seen it pronounce it the greatest strike ever made in this county. Messrs. Schultz and Zirn have made several trips to Carson in the past ten days taking in from $2,000 to $3,000 worth of gold every trip. The mine is guarded by two men day and night, and the ore is so rich that only a very few people have been allowed to see it at the mine.

It is now regarded as certain that this district will be systematically prospected and it is confidently expected that many paying properties will be developed. It is hoped that all who have taken up claims will work them, in some way. The Pine Nut hills are full of gold and a little systematic work will surely bring some of it to light.

A town site has been surveyed on the flat this side of the Zirn mine and everything is progressing favorably for a booming mining camp. It is probable that other rich discoveries will be made soon, and to this end all should put their shoulders to the wheel and assist in developing the district.

The amount taken to Carson by Zirn and Schultz is variously estimated at from $6,000 to $20,000, and those who have seen the mine say there are thousands more in sight.

A SCANT WATER SUPPLY.—*Enterprise:* Evan Williams of Empire, superintendent of the Mexican mill, in speaking of the prospects of starting up the Mexican mill for a permanent run, said that operations would be commenced next week, but that it depended entirely upon the water supply how long the run would be continued.

What Mr. Williams says is not particularly encouraging. Last week the mill started up on south-end ore, but could continue crushing for a day only, as the water supply in the river was then depleted. The farmers up the river with but two exceptions have all discontinued using the water. These two are still continuing to turn the precious fluid out on the sagebrush.

A litigation has been commenced against these two agricultural gentlemen, but as law is long, it is difficult to say definitely when the quantity of ore now at the Crown Point and other south-end mines can be reduced. As these mines will all start up as soon as the mill can resume work, the ebb and flow of the water in the river is watched with great interest by the miners who are anxious to resume work.

The stock market will also be greatly influenced by the resumption of work at the Mexican mill. Outside dealers like to see bullion being turned out. It is hoped that work will speedily be resumed.

A NEW MILL AT SILVER.—*Enterprise:* H. C. Biggs of San Francisco was on the Comstock lately. Mr. Biggs owns the principal interest in the Red Jacket mine at Silver City. He is having a mill built in California which operates on an entirely new principle. This mill will be erected in Silver, to crush Red Jacket ore. It is a series of mortars, the principle not being unlike that involved in the Kincaid mill which is in operation at the Occidental. Mr. Biggs is now at Silver.

MAY BECOME VALUABLE.—Elko *Independent:* J. E. Morris, who is interested in an extension of the Elko soap mine, brought in nineteen sacks of the stuff to-day to ship to the aluminum works at Los Angeles. Should the test to be made prove satisfactory, there will be a big demand for the clay, and the owners of the property may become millionaires before another year rolls around. There is a fair prospect that something will be done with the property, as the deposit carries a high per cent of aluminum.

PINE NUT.—*Tribune:* The strike in the Zirn-Schulz mine at Pine Nut continues to be the theme of conversation in Carson. The ore brought in by Zirn is on exhibition at the Arlington Hotel and swarms of people have been flocking into the hotel to-day to examine the same. Mining men from Virginia are astounded at the richness of the ore, and say that if there is any considerable body, Pine Nut will soon be a booming city.

Kennedy District.

C. A. Norcross is very enthusiastic over the prospects of the Kennedy camp. The mill has proven a gratifying success. He says there are about 450 mining locations and a great many are developed into good-paying ledges. The are 450 men in camp, a town hall, a two-story saloon, hotels and numerous other business houses.

SOUTHEASTERN NEVADA.—The Pioche *Lode* says: It is rumored that the consolidation of the P. C. Co. and the Nevada Southern Railroad Company has been effected, with J. R. De Lamar and H. B. Chaffin as prime movers, and, with other prominent Eastern capitalists, the work of pushing the line from Milford to Pioche over the old U. P. grade will commence at once and be completed before Christmas.

OREGON.

McKune & Co. are building a stamp mill in the Blue River mining district, 50 miles from Eugene.

Ten stamps will soon be added to the Moores mine near Baker City, a concentrating plant has already been added.

The Horseshoe mine, located on Wolf creek, has been leased to a company of practical miners for one and one-half years.

The management of the Baisley-Elkhorn mine will soon resume operations. They will put in a chlorination plant for working their ores.

Wm. M. Hannum has sold 80 acres of rich placer ground on Upper Grave creek, Josephine county, to Messrs. Davis & King of Medford, who will lay 15-inch pipe and fix for heavy pressure by the time fall rains set in. Upper Grave creek has long been recognized as rich in pay dirt, but it will take more or less capital to bring water on and lay the gold dust bare. Already fifteen tons of machinery are on the road to the grounds.

The Mollie Hill, situated on the summit of Mt. Reuben, Josephine county, has been sold to Jacob Kamm of Portland. The shaft that has been sunk to the depth of 90 feet, was started on ten in. of $40 ore, discloses at the bottom four feet of ore that will average $90 to the ton. This property will soon give employment to a number of men, as the owner intends tapping the shute 600 feet deep, which will require a tunnel 700 feet in length.

WASHINGTON.

CLEVELAND AND OLYMPIA.—Spokane *Review:* The purchase of the Cleveland and Olympia mining claims on Hunter creek, about fifteen miles northwest of Springdale, on the Spokane Falls & Northern, has been fully confirmed. The properties were first secured by Howard C. Walters under a three years' lease, with an option to purchase at any time during the lease at $150,000. This lease and option were then sold to a syndicate of Spokane people, who yesterday again sold and assigned to Messrs. MacAuley and Monaghan of this city and Coeur d'Alene. As the properties were examined by George B. MacAuley before the latter transaction, the sale emphasizes the seemingly extravagant statement hitherto made about these properties.

With practically no development a great body of galena ore has been disclosed in the Cleveland. The dimensions of the ore in sight are roughly stated at 10 by 25 by 100 feet, or perhaps 4,000 tons, averaging 30 ounces of silver and 30 per cent. lead per ton, and capable of being readily graded up to 40 ounces silver and 40 per cent. lead per ton.

BRITISH COLUMBIA.

NEW DENVER.—Nelson *Miner:* Mr. Finch has thrown up his bond on the Reid and Robertson, stating that he saw nothing in sight to justify any further expenditure on it. The people at Silverton and in a less degree at New Denver were needlessly discouraged at the news, because even if the Reid and Robertson vein has petered out there are numbers of other vast deposits of ore around and new finds are being made almost every day.

The owners thoroughly believe in their property and congratulate themselves on the $15,000 worth of work done on the mine of which Mr. Finch has now made them a present.

IDAHO.

IT'S ALL RIGHT.—Owhyee *Avalanche:* The Tip Top mill is running satisfactory. It is reducing about four tons to the stamp, or forty tons daily. Assays of the tailings show that less than $1.50 per ton is going out of their mill. Colonel Bryan says that when they get the other four vanners in position and double their copperplate surface, the mill will handle five tons to the stamp. The mill force, when everything is down to a regular basis, will require but three men on a shift—engineer, battery man and vanner man.

There is no question as to the unqualified success of the milling plant, and with this cheap and effectual method of milling the Tip Top mine is a great property.

DREDGING THE SNAKE.—*Tribune:* E. D. Roth and C. S. Davis of the Roth Amalgamating Company have returned from the Snake river placers, near American Falls, where they have been setting up two of their amalgamating machines. The machines, with boiler, engines, pumps and grizzlies, are mounted on a flat boat, and the bottom of the river is being dredged for the black sand that contains the flour gold. The two machines have a capacity of 220 cubic yards per day, and the run and cleanup was most satisfactory to Munn Brothers, the owners of the placers. Snake river gold has long been known as the most difficult gold to save, on account of its extreme fineness, but the Roth amalgamators saved it all on this run.

MONTANA.

Great Falls *Tribune:* One or two cleanups have been made the past week on some placer claims at Yogo. The miners report having made expenses, and several nuggets worth from 75 cents to $1 have been found.

Red Lodge *Picket:* The Clark's Fork gold diggings are still continuing to pay good wages under the present crude system of ground sluicing. Every cleanup made so far, in which the gravel has been washed in a proper manner, has shown good pay. C. W. Chowning has been systematically prospecting the ground with a view of putting in modern gold-saving machinery and has been more than satisfied with the results. A recent test of four yards of gravel yielded him $5, which is considered exceedingly good.

Virginia City *Madisonian:* A deed conveying from James E. Madison and wife, of Gallatin county, to the Baltimore and Montana Reduction Company the Golconda group of mines at Red Bluff, was filed for record with the County Clerk and Recorder this week. The consideration was $65,000. The articles of incorporation of the purchasing company, which is stocked for $300,000, were also filed.

SOUTH DAKOTA.

RICH YELLOW CREEK—$3,700 FOR 25 TONS. *Pioneer:* A. G. McShane and brother, of Yellow creek, shipped twenty tons of ore to the D. & D. smelter getting returns of $90 to the ton, or $1,800 for the lot. A few days later they sold thirteen tons of ore for $1,320. They have nearly completed another car of ore from their mine which they will ship to the same smelter to-day. They are working as fast as possible on this shipment of twenty-five tons and the smallest assay made from a mixture of the ore gives a return of over $150 to the ton. This country is on the verge of a mining growth that will equal any yet seen. Three months ago the ground on which this strike was made was not even thought of as mineral ground. Prospectors passed it by on their way to other fields to gather wealth and left these rich deposits to be discovered almost by accident. At present there is not a foot of ground to be had and discoveries of rock assaying from $25 to $150 to the ton are being made and kept quiet until the ledges are developed. The various plants in Deadwood and vicinity in three months will not be able to handle the ore that is now being uncovered in the Yellow creek and Bald Mountain country. Prospectors are at work in every gulch in the country and there are parties coming into the city here to purchase provisions who leave and are not seen for a week or two and they have prospects of ore that only the assayer knows anything about. Last week a discovery of ore was made and the ledge found just under the grass roots a little work disclosed a body two foot thick and three assays $26.90, $29.60 and $29.75 only six feet from the surface.

Black Hills *Times:* One of the owners of the Decorah mine informed the *Times* yesterday that work was indefinitely suspended owing to the demand of the Terry Miners' Union that none but union miners could work in that district, and that they should not work for less than $3.50 per day. The work so far done on the mine has been with pick and shovel, for which the men were paid $3 per day.

COLORADO.

LA PLATA DISTRICT.—Report received at Denver from the La Plata district, in Southern Colorado, where Senator Jones and his associate made extensive purchases last spring affirms the existence of a body of gold-bearing ore 700 feet thick and 2600 feet long. The ore is free milling and averages, $5 a ton.

J. W. Pender says the Baker contact is the largest ore deposit that has been discovered on the American continent. No engineer can figure how many tons there are in that great bank of conglomerate, but at a low estimate there are 7,000,000 or 8,000,000 tons, averaging $5 a ton.

The experimental mill which is being erected by the company, will be in operation within the next twenty days. A test run of twelve and a half tons of ore and it came from the vein cleaned up $10.91 to the ton.

The Baker contact is described as an oblong vault of conglomerate, 2600 feet long on the surface and containing dykes which were forced up from below ages ago. It is estimated that the actual cost of producing the yellow metal from the immense gold quarry will not exceed $1.40 a ton. This includes mining, delivering at the mill and cost of reduction.

THE ELKTON COMPANY.—At the annual meeting of the Elkton Mining and Milling Company the old officers were re-elected, the Board of Directors was increased from four to five, and William Shemwell elected to fill the vacancy. The report submitted by the treasurer shows that the mine has produced since last October when the first car of ore was shipped, about $95,000 worth of ore. Of this there was paid on leases, labor and other expenses about $60,000; $27,569 having been paid in dividends and $4,200 in cash on hand, together with five cars of high grade ore at the smelter.

THE EMPIRE MILL.—The Empire mill, says the Pitkin *Miner*, is soon to be started up by Cripple Creek parties, who intend to operate it as a custom mill. If the proper process is put into this mill, that will treat the gold belt ores successfully, it will be a great factor in returning prosperity to our district. There are many properties in our gold belt which have large deposits of low grade ore that could supply a mill continually with abundance of material.

HEAVY MINING DEAL.—Boulder *Camera:* Miles and Cæsar Grant and David E. Brash have sold to the Gold Mountain Mining Company of Iowa the General Weaver, Annex, Highland, Mountain Boy, Mountain King and other lodes for $1,500,000, the receipt of which in lawful money is acknowledged and confessed.

UTAH.

THE SMELTING SITUATION.—*Tribune:* The smelters, remarked a prominent smelter man, as yesterday he reviewed the situation, are at present operating at about one-half the capacity of a year ago, and employing but about two-thirds the number of men employed at that time. The only thing by which these conditions can be overcome is an improved market for the metals, and until that change comes he looks for no improvement.

At present the receipts at the smelters show the lead-silver ores and argentiferous iron ores preponderating, with Tintic, Bing-

ham and Frisco as the principal sources of supply. The receipts from these producing points yield a general average of about seven ounces silver and a high percentage of iron or lead, with those from Bingham carrying gold of the value of $2 or $3 per ton.

A slight increase in activity among the dry ores is reported since the reduction in the tariff on lead, although the companies owning bodies of this class will never consent to market in any quantity at present prices, which simply means a realization of about $40 a ton on ore the metallic value of which is 100 ounces silver per ton. There are some exceptions, say the smelter men, but they are isolated and are confined to such camps as Creede, where the cost of production is practically nothing as compared with those properties that must contend with water and maintain expensive pumping machinery.

The smelting men claim to have done all in their power for the relief of the producer during the present depression, and to have reduced the price of treatment to such a level that any further reduction would be the undermining of their plants. On silver-lead ores, on the argentiferous iron ores ferruginous ores carrying gold of the value of $2 they claim to have cut the price to the lowest possible margin, trusting that when the market improves the producers will reciprocate.

MERCUR DISTRICT.—THE GEYSER'S MILL: *Tribune:* The Geyser Gold Mining Company, whose properties are situated at Mercur, is rapidly perfecting arrangements for an active winter campaign. Mr. S. B. Milner went to Bingham yesterday, where he is putting up a gold mill which, under the agreement, is to be in operation by November 1st. The mill has a crushing capacity of 200 tons a day and a leaching capacity of 50, which, it is said, will be increased until it is capable of handling the product of the bonanza. The average value per ton is fixed by recent assays at $12.

A DOUBLE DIVIDEND.—*Tribune:* The Centennial Eureka Company threw a surprise into the mining fold in the shape of a double dividend, amounting to $1 per share, or $30,000 in all. It was a surprise because it was the usual monthly dividend twice multiplied. An unusually good run of ore accounted for the increase. The dividend was numbered 57 and 58, which indicated that in the nine years of the company's existence fifty-eight dividends of fifty cents each had been paid up to date. That is equivalent to a money aggregate of $870,000. The first five years of construction were accompanied by no dividend. It is therefore within a period of four years that the above amount has been paid. The ores of the mine are almost entirely of silver and gold, with very little lead.

ARIZONA.

The United Verde Copper Co., of Jerome, have 450 men employed in various capacities, and upon completion of the railroad, a correspondent of the Prescott *Courier* says, he is informed that the force will be doubled. This can easily be done, as the mountain upon which the mines are located is one solid body of mineral, varying to some extent in richness, but the whole can be worked at a profit. Improvements and additions are continually being made with a view to increasing the output of the mines, the latest being a converter which will convert the matte into copper. The converter will be completed and in operation in about two weeks.

RICH STRIKE. — *Republican:* Word is received of a wonderfully rich gold strike made by some Mexicans on the Hassayampa, two miles below Powell's camp, opposite the mouth of Fool's canyon and within rifle shot of the river. Nuggets weighing several ounces have been taken out of the ledge and there are about forty Mexicans engaged in taking out coarse gold in the gulch below the ledge. The ledge is well defined and consists of about three feet of a pay streak, in granite and porphyry. A miner who came in from that country yesterday says that he believes the find to be one of the most remarkable in the territory within recent years, and bids fair to excel the Harqua Hala strike.

STILL RICH.—*Miner:* The idea has gone forth that the mines about Mineral Park, Stockton Hill, Cerbat and Chloride have been dug out, and the district has received derogatory mention at the hands of parties who know little or nothing of what constitutes the sign of promising prospects. Some few sturdy miners have stood by their properties and steadily worked ahead, while from time to time new discoveries have been made. At the present time no district in the county can make a better showing, and the recent "strikes" made are astonishingly rich.

THE Riedler air compressor, installed by Fraser & Chalmers for the Milwaukee Mining Co., Idaho, affords a good lesson in steam economy, as well as an illustration of the success of the Riedler system. It supplants a smaller compressor of another make, and does twice the work on one-fourth less fuel, so that the cost of fuel is in round numbers as 2¾ to 1 for similar work between old and new plants. On the work done with wood at $3.50 a cord this amounts to $9000 a year, an actual reduction of fuel bill of about two-thirds.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

STANDARD ELECTRICAL DICTIONARY.

By Prof. T. O'CONOR SLOANE.

Author of "Arithmetic of Electricity," "Electricity Simplified," Etc.

The "Standard Electrical Dictionary" is what the work purports to be, exhausting the subject of electrical terms, giving each title the clearness of explanation necessary to make the understanding of it complete, without unnecessary elaboration. In this work every electrical word, term or phrase will be found intelligently defined.

The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the every-day electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of the greatest science of the times.

624 Pages. 350 Illustrations.
Handsomely Bound in Cloth, 8vo. PRICE, $3. Extra Super Calendered Paper.

What is said of the STANDARD ELECTRICAL DICTIONARY.

The dictionary gives evidence of a large amount of painstaking work on the part of the author, and possesses features which must be commended. Among these, the author, wherever occasion required it, has furnished the synonyms of terms, and the hook is given an additional value by an alphabetical index, which enables it to be consulted for terms both collectively and individually. The work will prove of value to the reader, whether professional or non-professional. The definitions are put tersely and concisely, so that the inquiring reader can carry away a defined, net impression as to what is meant. Any student who will spend his leisure hours over the volume will be amply repaid for his time and trouble. The book is very clearly printed in bold type on good paper, and is well bound.—*N. Y. Electrical Engineer*

Electrical Progress.

The Trolley Unnecessary.

The cntting of electric roof wires now going on under the supervision of District Engineer Wills continnes. Chief Sullivan thinks that he will not be enjoined; and while the work occasions loss to private corporations, he thinks that the pnblic good is of paramouut importance.

The underground conduit system of the Edison Company being confined to incandescent wires, it appears that the consequnent loss of cnrrent would prevent its application to the entire circuit.

The condnit system for operating electric cars is again reported solved, and conservative commnnities opposed to the trolley will, if so, be deprived of oue of the principal argnments against the advent of the electric street railway.

H. F. Peterson of Milwaukee, Wis., has a plan to divide the condnit into two compartments. The conduit is located wholly heneath the gronnd and is made in sections which can be closely wedged together, so as to form watertight joints. On the top of the casing is a longitudinal slot, the same as in the cable coudnit, for the pnrpose of admitting the contact-carrying device. This slot opens into one compartment of the conduit, and into this compartment all the dirt and water of the street is permitted to fall, but no damage can he done to the electrical conductors, as the compartment is separated completely from the one containing the conductors. Not only are the compartments separated, but the contact device has an arm which carries a steel broom. This sweeps the dirt and water which fall into the compartment to manholes, which can be located at convenient distances aloug the line.

The second or electrical compartmeut is covered with a flexible material, which is usually kept tightly closed, but which may hc opened by a pulley wheel, which is attached to the contact arm of the car. This compartment is located out of line with the slot, so that no water drippings can ever strike it; but even if they should, the cover at the top wonld carry them iuto the first compartment and they wonld be swept away hy the hroom. Within this compartment a constant circulation of air is kept np so as to prevent any moisture collecting on the walls, on the conductors or on the iusulated supports. This circulation of air may be supplied hy the moving of the cars or by a fan attached to the conduit at the power-house. The conductors in this compartment are not the ordinary trolley wires which may snap at any moment or be worn out by a little friction, but they are steel contact rails, which can he divided into sections of any desirable length. There are two of these rails iu the compartment, oue of which is charged with the positive current at the power-house and the other returns the curreut, so that none of the power is lost by leakage.

The contact rails are held to the sides of the compartment hy a strong insulating substance so as to be perfectly insulated from all other parts; fnrthermore the whole compartment is coated in the inside with a waterproof insulating paint. The main feeders to the rails are laid in insulated metallic pipes. Each section of the contact rails is conuected with the two main feed wires and is provided with a switch and cntout device, so that in case any trouble should occnr each section can be cut off and necessary repairs be quickly made without in the least interfering with the operations of the rest of the line.

The contact positive rail carries the power, aud this is transmitted to the motor on the car by a carrier which extends from the car through the slot into the first compartment. It is provided with a lateral arm arranged so as to bring its lower end into the compartment in which are the conductors. It is provided with two shoes which slip snugly over the upper portion of the contact rails and cannot by any accident jump off. A wire extends from each shoe through the hollow arm to the motor on the car. The positive wire carries the power to the motor, and it is at once carried hack again and returned on the negative rail.

It is claimed for this system that it will not only do away with the danger from fire which exists whenever the overhead trolley is nsed, but that it will also prevent all corrosion of gas and water mains which now snffer so mnch from electrolysis along the lines of electric street railways. The rail is not connected with and in no way receives the electric current, consequently the electricity cannot get into the ground and eat the pipes.

It is asserted that before many months a movement will he made in the ultimate direction of replaciug the cahle railway on Market street with electric cars.

The Steamer Northwest's Electric Equipment.

There are some very interesting matters in connection with the new steel passenger steamer Northwest, of the Northern Line, especially in reference to the vessel's nse of electricity, that have not been pnblished. In preface it may be said that on no vessel in existence is there such general use of the electric fluid as on this greyhound of the great lakes. When is considered the wonderful extension in the employment of electricity on modern ships of war aud on the latest Atlantic liners, this statement may seem almost a piece of iusular pride and prejudice, but it is made on authority that cannot be charged with such prejudice.

The vessel is lighted by 1800 incandescent globes, every one of which is hidden behind gronnd glass. This number, it is claimed, is 300 more than is in use in any of the Atlautic ships, even though the largest of them are 200 feet longer than the Northwest. The Campania and Lucania, of the Cunard fleet, embodying the very latest in marine development, have about 1350 lights each. The Northwest's lighting eqnipment is driven by three direct conpled engines, each dynamo having 600 light capacity. The vessel has electric elevators hetween the freezing rooms in the forehold and the kitcheus and cafe. She has electric signals everywhere. When the lookout, pacing the foredeck, sights a ship or wants to call the attention of the wheelhouse to any matter, he does not call ont, but steps to the rail and touches a button; immediately an answering ring assnres him that his signal has been heard and heeded.

As the vessel approaches her dock there is a noticeable absence of the usnal shonted orders from deck and bridge. It is all done by the electric bell, which was never known to swear or to be tempted to use langnage that would not he permissible in a parlor, something the man in charge of the deck has the reputation of doing occasionally. When the captaiu ou the bridge wants to give an order to the wheelhonse, or the engine-room, or the stokehole, or anythiug else, he merely turns to the second officer beside him, gives the order, and the latter presses a button. There are no less than six methods of signaling from the hridge to the different parts of the ship, and of these all bnt one are electric. The vessel's red and green side lights, than which nothing on the ship is more important, are not the universal oil lamps, but are high-power incandescent globes, and with them is a little instrnment that audibly records in the wheelhouse any accident that befalls the lights.

When the ship's big whistle is to he blown, instead of tugging at a whistle cord, the officer touches a button, and if it is desired that the whistle blow consecutive blasts at intervals for any desired length of time, a switch is turned. Not only is the whistle sounded, bnt on a continuons strip of paper is printed the time and dnration of every hlast, a record almost invaluable in cases of collisions in fogs, where conflict of evidence as to the proper signals is almost sure to arise. There are electrically driven fans in various parts of the ship, closets, kitchens and inner passages everywhere, hut these are particnlarly notable in and ahout the fire-rooms. Every one knows what an inferno the ordinary stokehole of a large steamship is from the descriptions that have often been given. In this part of the Northwest it is so cool that, with the fan aperture half closed, it is actually uncomfortable to stand uear the bunkers. So far from being naked demons in a little hell, the firemen actnally wear clothes. This is an innovation that ocean ship hnilders conld very acceptably follow. The ship carries a search light that will pick np a pilot boat letter 12,000 feet distant. There are many other novel features in tbe electric installatiou of this most modern of all the modern vessels, hut those indicated are the more interesting and new.

THE United States is by far the larger nser of electric light, but the methods of production and ntilization in nse here do not appear to be quite so economical as those practiced abroad, says an exchange. The plants throughout Europe are generally ou a mnch more modest scale than here, except iu a few snch cities as Berlin, Hambnrg and Vienna, yet recent statistics show that some of the smallest are competing successfully, not only with long-established gas works, but with petrolenm. Very little of the current, however, is used for power purposes, and couvenieuees like the fan motors now rnnning daily by the hundred thousand in the United States are well-nigh nnknowu, so mnch so that when needed they are shipped from New York. In Berlin 19.9 per cent of the current is employed in lighting dwellings and hotels, but in Hamburg the same item runs up to 38.7 per cent. Store lightiug in the larger German and Austrian cities averages 30 per cent of the current. Berlin and Vienna use much less than 10 per cent of the current for driving motors in factories, stores, etc. Exceedingly little use is yet made of the current for heating. A large proportion of the stations have storage-battery equipments; in this country this anxiliary is almost unheard of in central station operation, thongh nobody appears to know why.

RUPTURE!

It has beeu considered by the medical profession that heruia—commonly called rupture—was incurable, except by surgical operatiou, which is both daugerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 aud 87 CHRONICLE BUILDING, has opeued a uew field for research, and for the past year has beeu making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only whllo in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Practical Information.

How to Remove Cinders from the Eye.

Nine persons out of every ten with a cinder or any foreign substance in the eye will instantly begin to rub the eye with one hand while hunting for their handkerchief with the other. They may, and sometimes do, remove the offending cinder, but more frequently they rub until the eye becomes inflamed, bind a handkerchief around the head and go to bed. This is all wrong. The better way is not to rub the eye with the cinder in it at all, but rub the other eye as vigorously as you like.

A few years since I was riding on the engine of a fast express, says a writer in the Buffalo *Evening Times*. The engineer threw open the front window, and I caught a cinder that gave me the most excruciating pain. I began to rub the eye with both hands. "Let your eye alone and rub the other eye" (this from the engineer). I thought he was chaffing me and worked the harder. "I know you doctors think you know it all, but if you will let that eye alone and rub the other one, the cinder will be out in two minutes," persisted the engineer. I began to rub the other eye; soon I felt the cinder down near the inner canthus, and made ready to take it out. "Let it alone and keep at the well eye," shouted the doctor pro tem. I did so for a minute longer, and, looking into a small glass he gave me, found the offender on my cheek. Since then I have tried it many times, and have advised many others, and never knew it to fail in one instance, unless it was something sharp, as a piece of steel or a substance that cut into the ball and required an operation to remove it.

Catch Questions.

A snail climbing up a pole twenty feet high ascends five feet every day and slips down four feet every night. How long will the snail take to reach the top of the pole?

A wise man having a window one yard wide and one yard high, requiring more light, enlarged his window to twice its former size, yet the window was still only one yard wide and one yard high. How was this done?

This is a catch question in geometry, as the preceding is a catch question in arithmetic. The window was diamond at first and was afterwards made square.

As to the first, perhaps it is scarcely necessary to point out that the answer is not twenty days, but sixteen, since the snail, who gains a foot each day for fifteen days, climbs on the sixteenth to the top of the pole and there remains.

A CINCINNATI MAN makes the following statement to a reporter for the *Enquirer*: "I was invited to select a tree, which I did, and it was cut down for me in the morning. I watched it during the day undergoing the various processes of paper-making, and at six o'clock that evening it was paper. At midnight a portion of it was sufficiently dry to be taken to a printing office, and a few of the copies of the next morning's paper were printed on this product. From a tree to a printed newspaper in twenty-four hours is probably the best time on record."

VERY great difficulty is experienced, even by the most skillful machinists, in removing the rusty rivets from the frames of locomotive engines. The master mechanic of a shop in Hornellsville, N. Y., a week ago Saturday, tried a new plan for this purpose. He fired a blunt-pointed drill from a small caunon upward under a frame, so as to hit a bolt squarely. The idea was a great success, and its application was continued.

ONE of the many industrial uses of photography at present is to illustrate new styles of boots and shoes, so that commercial travelers may take merely an album, and not a box of samples, when out on the road looking for orders.

Steam Receiver and Separator

IS AN ENGINEERING DEVICE OF GREAT MERIT, ENSURING FULL PRESSURE OF STEAM AT THE BEGINNING OF ENGINE STROKE, AND A GOOD CUT-OFF.

WRITE FOR NEW PUBLICATIONS ON STEAM ENGINEERING.

THE primary object of transacting business, says a Chicago exchange, is is not to occupy one's time, but to make money. A great many people seem to lose sight of this end and imagine that if they are selling a large amount of goods or making a vast number of machines they are doing exactly the right thing. A salesman who can beat the house of Jones & Smith out of a large sale is usually commended, even though his firm loses money by the operation. Competition has become so sharp in almost all lines that the question of profit is lost sight of in the mad rush for business. To hurt a competitor is too often regarded as the same thing as helping one's self. Next to attempting to do business on insufficient capital, the practice of doing business for the sake of doing business is accountable for the vast number of failures of the present day. Customers secured through cut prices are hard to hold, since they are always looking for like concessions. It is better to sell a few goods and make a fair profit than carry on a "land-office business" at a net loss.

THE largest steel plate ever rolled in the world was turned out at Chester, Penn., last week, by the Wellman works. It measured 450 by 130 inches, and was an inch and a quarter thick. It is designed for the rudder-plate of one of the great steamships of the American Line now being built by William Cramp & Sons.

Over Four Thousand in Actual Use.

By referring to the advertisement of Jas. S. Brownell, on the sixteenth page, it will he seen that over 4000 Frue ore concentrators are in use. In the United States, and every mining center in the world where the concentration of ore is carried on, the Frue Vanner is recognized as the only machine that can he depended on to give universal satisfaction.

This machine is the result of years of study, and in all competition of concentrators the Frue Vanner is taken as the standard machine, and all comparisons made by it, and is the only endless helt concentrator in the market that will handle all classes of ores, and give satisfactory results at hoth ends of machine, *i. e.*, a perfectly cleau coucentrate with the least possihle loss. Certainly the Frue ore coneentrator, which has heen in actual use for more than half a deeade, and in competition with all devices for the concentration of ores, must possess true merit, or else it would have heen displaced. The facts are that the sales have increased from year to year.

Mr. Jas. S. Brownell, suceessor to Adams & Carter, is the western agent for the Frue Vanning Machine Co.; office, 132 Market street, San Francisco, Cal. Illustrated catalogue will he furnished on application.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 27, 1894.

The sanguine prophecies of silver's steady advancement are, so far, not in consonance with the facts. One month ago silver was 66; during the week it has revolved about 63¼. Low-water mark was, however, reached six months ago, when it weut to 58¾. Shipments aggregating nearly $1,500,000 were made from this city to China and Japan during the month; 400,000 ounces and 100,000 Mexican dollars were shipped from New York to England during the month.

Regarding the use of silver money by the Chinese, it is worthy of note that the Chinese system of currency is based upon a certain weight of silver, and not upon the number of a certain coin. Although the currency consists of "chopped" Mexican dollars—that is, the Mexican dollars are defaced by striking with dull-edged instruments—yet $1000 Hong Kong currency does not consist of 1000 of these defaced dollars, hut of 717 taels weight of them. If the coins are new, 1000 by count weight would be about 720½ taels, and 717 taels would consist of only ahout 995 pieces. The tael is equal to 579.84 English grains. Any one presenting a check or notes for $10,000 at a bank and wishing to receive coin would have weighed out to him 7170 taels weight of chopped dollars, consisting of 9950 pieces more or less. This system is said to he not so inconvenient as at first appears. Banking, hoth Chinese and European, is well developed in Hong Kong. Payments are nearly always made by checks or notes of the chartered or Hong Kong and Shanghai banks, the aggregate circulation of these notes being about $6,000,000, and there is a plentiful supply of subsidiary coinage of 50, 20, 10 and 5-cent pieces, which passes by count. Consequently Europeans and Americans, in their small private transactions by notes, checks and small change, manage to avoid altogether the weight system; in fact, many do not realize that it exists. But in large husiness transactions, such as balances between banks or shipments of coin to other places to pay for produce, the coin is always weighed out in the standard proportions.

The London *Times* says tbat, despite the ignominious failure of the syndicate which engineered the corner in tin in 1887, French and Dutch speculators are again trying to obtain control of the market. They are said to already hold about 16,000 tons of tin. The purchases have already caused a rise in price of $30 per ton. They have hoped that America would he obliged to have recourse to European markets, but, adds the paper named, they are likely to he disappointed, hecause America "could supply itself from Chinese merchants of the East Indies!"

An advance of $1 a flask is noted in quicksilver.

New York Prices.

NEW YORK, Sept. 27.—Following are the closing prices for the week:

Mining Share Market.

SAN FRANCISCO, Sept. 27, 1894.

Comstocks were huoyant during the week, Con. Cal., and Ophir, as usual, the center of attraction. Next Friday the Bodie Con. Mining Co. pays a 25 cents a share dividend, the first since April, '85. In one month (August, '78) that mine paid $400,000 in dividends. In the last three months of that year it paid $400,000 more. In '82 and '84 it paid dividends, and after many years gives its stockholders a pleasant suggestion of future possihilities.

The West Consolidated California and Virginia Mining Company has levied an assessment of 25 cents per share, delinquent Oct. 30th.

The following illustrates the changes of the week:

Coast Industrial Notes.

—The State of Washington last year supplied 33 7-10 per cent of the coal landed at San Francisco.

—The rails and rolling stock have been hought to equip the Sierra Valley and Mohawk railroad in Plumas county.

—Samuel Blair has foreclosed upon the property of the Cedar River Coal Co. of Washington, to satisfy a judgment of $41,400 for money loaned.

—The water committee of Portland's City Counell has sold honds to the amount of $2,200,000, and has authority to sell another $1,000,000. Of the latter, $400,000 will he put on the market at once.

—Charles A. Wetmore, the wine-grower, has bought from F. L. Fowler for a term of ten years the right to drill on the latter's land at Livermore for gas, and will carry on extensive operations.

—There is a reduction in the price paid for government surveys from the former maximum rate of $25 per mile for standard lines, $33 for township lines, and $20 for section lines, to $18, $15 and $12 respectively.

—Articles of incorporation of the California Gas Engine Company have heen filed. The directors are: P. M. Hendry, J. G. McElvaney, Chester Varney, John Wilsou and Joseph M. Ongh. Capital stock, $100,000.

—Schaw, Ingram, Batcher & Co., of Sacramento, have issued a handsomely illustrated catalogue. They are making sheet steel and iron pipe, and in the pamphlet give interesting views of their works at Sacramento and elsewhere.

—Articles of incorporation of the Pacific Eleetrical Company have heen filed here. The directors are; W. F. Beckwith, I. E. Rickey, F. H. Kimhall, John T. Hogan, George A. Clough, J. A. McCane and G. W. Rickey. Capital stock $30,000, divided into 6000 shares.

—The San Joaquin Valley Railway Co. is authorized to receive subscriptions to its capital stock. It is proposed to incorporate with a capital stock of $6,000,000, divided into shares of the par value of $100, for the purpose of constructing a continuous competing line of railroad from this city to Bakersfield. The trustees are pledged to maintain and operate the railroad at a competing line strictly, and shal! never have the power to sell out to competitors. No call for money shall he made until $350,000 is subscribed, after which subscriptions shall be payahle in installments of six months or more.

—The San Diego Land and Town Company has sold privately $173,000 of its five per cent honds, the halance of its $200,000 offered to stockholders, according to the circular of 1st June. The Boston directors and stockholders are the purchasers at 92½ net. This will provide for the construction of the Sweetwater system, to cover high lands not yet reached.

—The dividends dishursed last month on local shares of lighting enterprises were as follows: San Francisec Gas Light Company, $35,000; Pacific Gas Improvement Company, $15,000; Central Gas Company, $20,000; Pacific Gas Lighting Company, $6000; Oakland Gas Company, $6000; Edison Light and Power Company, $13,333; California Electric Light Company, $20,000.

—There is between $6,000,000 and $7,000,000 more money in the banks of California now than there was one year ago. The recovery from the panic, so far as the banks are concerned, is complete, and they are conducted on a more conservative hasis than ever. Of 575 hanks that failed during the flurry of '93 but five were in Califoruia, and two of them were sure to fail anyhow.

—The Pelton Water Wheel Co. have recently issued a new eatalogue which is a valuahle contrihution to modern hydraulie literature. It contains a vast amount of information relating to the utilization and development of water powers—of great interest to parties contemplating work of this eharacter. The subject of electrie transmission hy means of water power, now attracting so much attention, is treated in a most exhaustive way, statements heing given of the operation of a large uumher of plants of this character, accompanied by plans, illustrations and much other valuahle data. The Pelton system of power is one of the institutions of the country and is too well known on this coast to need any indorsement. Pelton wheels, almost without exception, are running every mining plant in the country where water is availahle for power. This company have also eonstructed many power plants for eleetrical stations in various localities, some of which have already heen described in these columns.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPTEMBER 18, 1894.

526,303.—CAR COUPLING—W. T. Drew, Sacramento, Cal.

526,348.—EXPLOSIVE ENGINE—H. F. Fraser, Antioeh, Cal.

526,306.—WINDOW-CURTAIN ATTACHMENT—J. M. Freeman, Oakland, Cal.

526,230.—WIRE-FORMING MACHINE—F. H. Howe, Port Townsend, Wash.

526,242.—CONCENTRATOR—L. Look, Soldier, Idaho.

526,249.—PACKAGE—M. J. Meeker, Puyallup, Wash.

526,084.—BUCKET—A. Mitchell, Carbonado, Wash.

526,191.—EXPRESS CAR—Morell & Ferrer, Santa Barbara, Cal.

526,087.—FURNACE—W. Ryan, Globe, A. T.

526,327.—TAP OR FAUCET—M. P. Schetzel, S. F.

526,268.—SASH FASTENER—J. Seadler, Sacramento, Cal.

526,121.—CHECK-BOOK BLOTTER—Toland & Conkey, San Jacinto, Cal.

526,092.—ROPEWAY CLIP—W. R. Wiggins, San Bernardino, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possihle time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BOX-MAKING VISE.—W. O. Knauer, Wood land, and A. V. Tyler, Sacramento, Cal. No. 525,501. Dated Sept. 4, 1894. The machine consists of a novel assemblage of hed and adjnstahle rests, stops and clamps, adapted to hold the loose parts of the hox until they are partially joined, and to receive and accurately adjust the box during the further processes of putting its parts together, and to accommodate different sizes of boxes. A single lever sets up both clamps to hold the two end pieces on edge. The side of the hox is then nailed on, whereupon the clamps are released and the partial hox is reversed and again clamped to receive the other side. The remaining walls are similarly nailed on.

CIRCULATING TUBULAR BOILER.—James A. Bernard, Bakersfield, Cal., assignor to the Locomotive Feed Water Heater Co., Bakersfield, Cal. No. 525,940. Dated Sept. 11, 1894. This invention relates to locomotive tubular boilers, and consists in a means for easing and protecting the superheater which is employed in the boiler from the direct action of the heat of the fire hox. The superheater is placed at an incline within the fire box, and has connected with it a means for supplyiug it with water at one end, a pipe or pipes connecting the opposite end and extending through the front of the furnace, thence returned to the hoiler at a point above the water line, and a protecting arch of fire hrick or clay inclined with relation to the superheater and supported from the sides of the water legs so as to surround the lower surface of the superheater.

TRUSS.—No. 522,764. July 10, 1894. Robert Nagler, San Francisco. This invention relates to an adjustable, automatically acting pressure plate and pad for the support of abdominal hernia. It consists of an elastic plate having an arched concave opening at the lower edge wherehy it is adapted to fit the parts to he treated, aud, in conjunction with this, of au elastie ring having one side fixed at the crown of the arch aud the other crossing the lower part, together with a pad of soft material fitting the pressure plate, and adapted to press against the part to he treated. This device is provided with suitahle pad and thigh straps hy which it is secured in place and the pressure varied and regulated as may be desired. The straps are provided with loose tubular sheathing which allows them any desired movement without chafing the hody. This truss cau be worn as a protector against ruptnre aud will recommend itself to the public on account of the virtues above enumerated.

Octrooi-Aanvrage

Voor Methode om Goud en Zilver van Hunne Oplossingen in Potasch Cyanide Afteseheiden.

Register-Nommer 683.

Ter algemeen narieht wordt hiermede bekend gemaakt dat William David Johnston van beroep scheikundige op den 31sten dag der maand Juli, 1894, en woonachtig te San Francisco, Amerika, te mijnen kantore gedeponeerd eene aanvrage voor een octrooi voor hovengenoemde uitvinding met hijheboorende heschrijving.

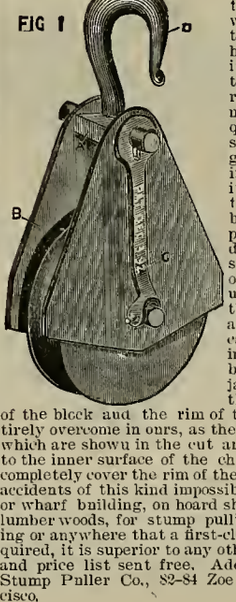
Nademaal nu de gezegde William David Johnston mij schriftelijk heeft kennis gegeven dat hij met deze zijne aanvrage wenscht voort te gaan, heb ik hepaald dat deze aanvrage en alle bezwaren daartegen zullen worden behandeld te mijnen kantore op Vrydag, den 14den dag der maand Decemher, 1894, ten 3 nre 's middags.

Ik roep daarom alle personen op, die er belang bij hebben zich te verzetten tegen het uitreiken van een octrooibrief voor gezegde uitvinding aan gezegden William David Johnston om ten minsten zeven dagen voor genoemden datum van behandeling te mijnen kantore te deponeeren een geschrift, waarin zij hunne bezwaren ontwikkelen, daar zij anders uitgesloten zullen zijn, die voor te brengen.

Aldus den 2 den dag der maand Augustus, 1894, te Pretoria, Zuid Afrikaansebe Republiek.

CARL UECKERMANN, SR.,
PAULNEL, Registrateur van Octrooien.
Gevolmoentigde.
Argus Maatschappij Beperkt.

Improved Steel Snatch Block.



This is admitted hy experts wherever tested to be the hest hlock of the kind in existence for the following reasons: Being made of the hest quality of refined steel it gives greater strength in proportion to its weight, and the opening side being a solid piece does not detract from its strength as in other blocks. In using wire cahle the great damage to which the cable is subject in other blocks by becoming jammed hetween the cheek plate of the block and the rim of the pulley is entirely overcome in ours, as the guiding rihs B which are showu in the cut are snugly fitted to the inner surface of the cheek plates and completely cover the rim of the pulley, making accidents of this kind impossible. For bridge or wharf building, on hoard ship, in mines or lumber woods, for stump pulling, house moving or anywhere that a first-class block is required, it is superior to any other. Catalogues and price list sent free. Address California Stump Puller Co., 82-84 Zoe St., San Francisco.

Union Gas Engine Co.

Pioneer Manufacturers

Of Gasoline Engines and Owners of Twenty Patents on Same.

ENGINES FOR MINING PURPOSES A SPECIALTY.

WARNING!

If you are in need of power for mining purposes investigate this engine and take no other. Many so-called gasoline engines are now on the market, which are direct infringements of our patents and it is our intention to bring suit against the various infringers. As the law holds the purchaser, as well as the manufacturer, we would advise parties who have already purchased other gasoline engines to obtain from the sellers of such engines a good and sufficient bond protecting themselves in case damages are obtained against them, as it is not the policy of this company to work a hardship on innocent parties, but the law makes no such provision.

Union Gas Engine Co.

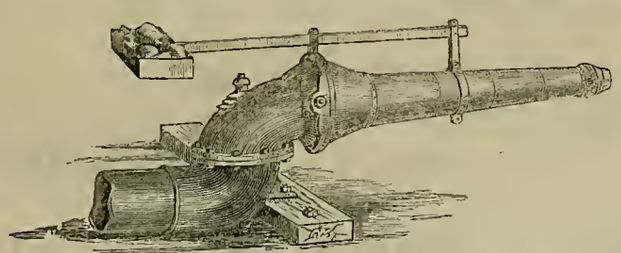
MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12 X 36 INCHES, THE MINE BELL SIGNALS AND RULES PROVIDED FOR IN the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market Street, San Francisco, Cal.

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 51 Fremont St., San Francisco.

The Blasdel Concentrating Belt Co.

OWING to improved machinery we are now able to sell our NEW IMPROVED CONCENTRATING BELTS for the "Triumph" or Frue Vanners at reduced prices; also our Improved Belts six feet in width.

Practical mill men must see at a glance the advantage of our belts over any other.

First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.

Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.

We manufacture smooth belts with our Improved Flanges to order. Send for references.

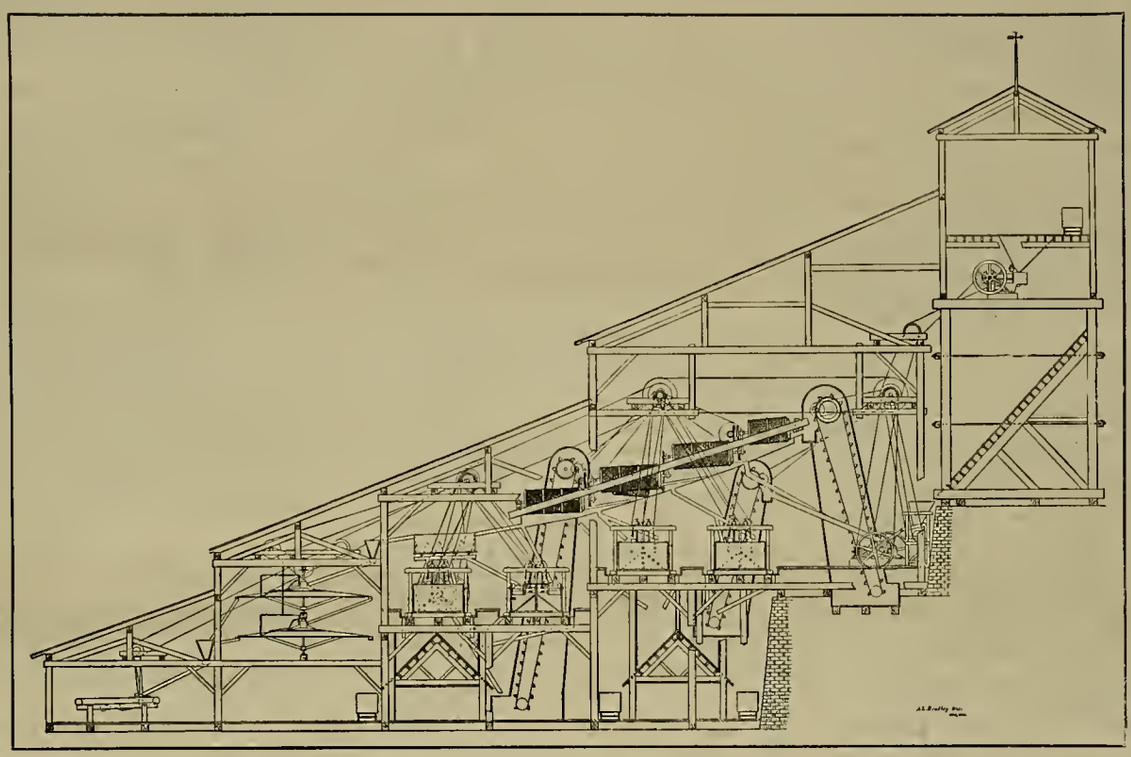
MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXIX. Number 14. SAN FRANCISCO, SATURDAY, OCTOBER 6, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Electricity in Mining.

With increased activity in mining comes augmented interest in electrical power as applied to all manner of mining work. In no department of practical science is electricity more prominent than in mining and metallurgy. At home and abroad the most promising plans of surface work and underground development have electrical power as the principal part of the proposition. The South African mine managers are so imbued with the present progressive spirit in the direction of using electric appliances that it is now proposed to spend £1,000,000 in putting up huge central sources of electrical energy and transmit power to widely separated gold mines, on the same principle that power is transmitted from Niagara to Buffalo. This long-distance transmission of power is claimed to be a feasible idea. It is calculated at the Witwatersrandt that 14,000 H. P. can be developed at an expense of three-quarters of a penny per horse power per hour. The idea has taken such a hold on the Randt mine owners that they have two propositions from European electrical engineers which take the nature of direct bids at precise figures guaranteeing exact results. Indirectly the move exhibits considerable faith on the part of the South African mine owners in the permanence and expansion of their gold fields.



SECTIONAL VIEW OF THE MORNING MINING CO.'S CONCENTRATING PLANT, MULLEN, IDAHO.

CALIFORNIA'S gold product is more than one-third of all the gold coin in existence. Since gold-mining began in this State the yield has been $1,284,000,000. It is calculated that the amount of gold coin now in use aggregates $3,750,000,000.

In accordance with law the trustees of the State Mining Bureau have made their report to Gov. Markham. It is a voluminous document and will be priuted in due time. State Mineralogist Crawford also makes a report in extenso. The several assistants also furnish separate reports, the whole forming a compendium of up-to-date information regarding the operation of the bureau and the present status of the mining industry.

The best and most improved mining machinery in South Africa and elsewhere is of American manufacture, and largely the result of California experience, experiment and invention. In that quarter lies large opportunity for development of business. In this regard it is of interest to note that during September one American firm in Chicago shipped 160,000 pounds of mining machinery to South Africa. That is a good country for San Francisco makers of mining machinery to exploit.

That the Australian *Mining Standard* loves its little joke is evinced by the following editorial paragraph in the last issue to hand:

Another marvel from Wonderland! An account of a very strange and wonderful insect, whose doings should prove of interest to students of bi-metallism, comes from Mexico. The minute monster in question is called the "traga oro," and his peculiar property is that he feeds and exists upon gold. It appears that the precious metal, after passing through the abdomeu of the "traga," is transformed into a black powder, from which no chemical agent has as yet been able to precipitate it. Senator Stewart, of the United States Congress, has, we are told, proceeded to Mexico with the express purpose of studying the habits of this luxurious insect, which is said to be self-propagating. Mr. Stewart perceives in this gold-bug a means of getting rid of the other kind of "gold-bugs" that infest the States, and he proposes to utilize its gifts by introduciug it surreptitiously iuto the vaults of the Sub-Treasury of New York, and in other places where gold is stored. "Should the enterprise prove successful," says an American journal, "it is clear that all confidence in gold as a basis of value will be destroyed, and we shall be compelled to fall back on silver as the only available metal for coinage purposes."

One of the most pleasing features connected with the quartz mining industry these days is that so many of the old miues are proving to be valuable ones. Mines that have been allowed to lie idle for from ten to twenty years are again "going conceerns." A ease in point is the old "Quartz Hill" mine, loeated about six miles above Redding, in Shasta county. This mine had been "going begging" for years, and with au idle ten-stamp mill built some years ago within half a mile or less of it. Latterly the mine was experted by M. Maryanski, M. E., and by him was purchased for a company of Chicago capitalists. Reports from there are to the effect that he has a ledge 650 feet long, and from six to ten feet wide, some of the ore running as high as $50 per ton. Such developments tend to give as much confidenee to the mining industry as new discoveries.

A Case in Point.

Attention has been directed to the value and necessity of a change in the mining laws such as is advocated by the Cal. Miners' Association, giviug applicants for pateuts for mining land an equal footing with applicants swearing that the laud they desire to possess is fit only for agricultural purposes. A case iu point is now awaitiug the decision of Hoke Smith, the honorable Secretary of the Interior.

In 1863 some miners located about 100 aeres of land at Sulphur Creek, Colusa Co. This land was mineral land if there ever was such a thing as mineral land. The Manzanita Gold Mining Co. came into possession of it by purchase in course of time. Maehiuery worth $50,000 was put on it, pay ore taken out aud treated at a profit. Two years ago Johu Hays Hammond, now in receipt of a salary of $60,000 a year as mining manager and expert iu South Africa, made a test of about 350 tons of the ore and reported a net profit of $186. He also made a report to Mr. Noble, then Secretary of the Interior, in whieh he stated that the ground iu question was traversed by veins carrying gold and cinnabar Prof. Becker of the U. S. Geological Survey made a similar report.

In '93—thirty years after the location—a man named Tilden Jones "located" this miueral deposit as agrieultural land. Three men—a blacksmith, a butcher and a lumberman—swore to his elaim. The testimouy of John Hays Hammoud, Prof. Beeker and Supt. Northey: the plain facts as stated, were deemed less worthy than the assertion of the three "agricultural" witnesses by the Register of the Land Office at Marysville, before whom the matter was tried, and who allowed Jones to file "a homestead" on it. This decision was confirmed on appeal to the Commissioner of the General Land Office. Now it goes before the Secretary of the Interior for final adjudication.

It is such a flagrant case of injustice to the miners, the owners of the property, that the bare recital of the facts should condemn all connected with the effort to do such injustice. It is hardly within the limits of possibility that a Cabinet officer will give official sanction to such an outrage. It is to prevent the recurrence of such acts that the miners of this State ask that the statutes be so amended that they may have equal footing and a show for justiee under the law.

The Verdict Affirmed.

The United States Circuit Court of Appeals decided last Wednesday on a point of iuterest to miners. It was an appeal from the Alaska Distriet Court in the ease of Patrick Whelan vs. the Alaska-Treadwell Mining Co. While employed in defendant's mine on Douglass Island plaintiff was injured by being drawu through a chute. He was breaking rock at the mouth, and wheu the chute was drawn he went with it. In the court of original jurisdiction defandant moved for a non-suit ou the grouud that Whelan's injuries were not caused by any negligence on the part of the company, but by the negligence of the fireman, who, before drawing the chute, had failed to uotify Whelan, and that the fireman was a co-employe. The lower Court held that the fireman was in fact a representative of the eompany, and negligence on his part should be interpreted as negligence on the part of his employers. The Court awarded plaintiff $2950 and eosts. The U. S. Circuit Court of Appeals last Wednesday confirmed the decision:

"The Supreme Court of the United States," it said, "has repeatedly declared that a master in employing a servant impliedly engages with him that the place in which he is to work and the tools and machinery which are furnished him, or the instrumentalities by whieb he is surrounded, shall be reasonably safe, aud that a failure to discharge this duty exposes the master to liability for injury caused thereby to the servant; that it is wholly immaterial how or by whom the master discharged that duty, and that the master's liability is not made to depend in any manner upon the grade of service of a co-employe, but upon the character of the act itself and a breach of the positive obligations of tbe master.

"It was the master's duty iu the present case to provide a reasouably safe place for its employes to work; to keep the chutes through which the quartz was drawn in reasonably good condition and repair; to employ competent persons in the management thereof, and to notify the workmen engaged in breaking rock in the pit when the rock in the chute would be drawn. Plaintiff, by his contract of service, did not assume the risk that this duty would uot be performed."

In the case of the Mammoth Mining Co. vs. Juab Co., Utah, the Utah Supreme Court has decided that under the statutes providing that "miniug claims" are not taxable, an engine and boiler built iuto a briek foundation, and firmly affixed by bolts leaded down and used in working a mine, are part of a mining claim and not taxable.

Sales of California Gold Mines.

The recent Midwinter Fair did mueh toward advertising and bringing to notiee the mineral resources of the Pacifie coast, particularly that of California, direeting the attention of capitalists to the mineral resources of our State. California gold mines have long been neglected and but little understood, and their values to a great extent ignored by the financial world and only oecasionally heard from as producers, unless it is some phenomenal mine like the Utica and Stickles, the Kennedy, the Rawhide, etc. Since the exhibit referred to California's gold mines have been sought after for investment purposes and rapidly bought up by both Eastern aud continental capitalists.

Mining has too long been looked upon with suspieion as speculative and extra hazardous. But the views of capitalists have changed and this business is now justly viewed as no more hazardous than farming, manufacturing, banking, mercantile or any other industrial pursuit, and the percentage of profits is much greater providing the mine is handled on business principles and with modern appliances. Miniug for gold again ranks as the prominent industry of our State. Placer mining is again forging to the front, the many millions of dollars that have been looked up in the ancient rivers are again beginniug to add to the yearly output. Many hydraulic mines loug lying idle from legal obstructions are being rehabilitated. Of the great number of sales that have been recently made it has been found diffieult in mauy cases to obtain the exaet figures paid, both buyers and vendors being in some cases reticent. There are quite a number of negotiations for mines now pending, but not closed. The following is a list of all that has been made public:

RECENT SALES OF CALIFORNIA GOLD MINES.

Empire, of Gold Valley, Sierra county, on the south fork of the east fork of the Yuba. Purchased by an English syndicate; price paid, $50,000.

Sommerville Con. gold mines, consisting of the Lena, Bellflower, Young America, Seminole, George and Worcester mines of Tuolumne county. W. Babcock, of New York, promoter; D. H. Cole, of New York, the purchaser; price paid, $1,000,000. A plant of the capacity of 100 tons per day is in process of construction. The same company has also purchased the Buckeye mine.

The Lady Washington of Tuolumne county, on the North Fork of the Tuolumne river, adjoining the Dead Horse and the Eureka Con., has been bought by James Rule; price paid unknown.

The Mammoth mine, near Jacksonville, Tuolumne county, bought by Wm. Johns for an English syndicate; price paid unknown—reported $80,000.

A New York syndicate has bought seven mines, situated one mile from the Dead Horse, Tuolumne county, Capt. D. H. Cole purchasing agent; price paid, $1,000,000.

The Victory, situated one mile from Tuttletown, Tuolumne county, sold for $110,000, with a pre-payment of $20,000; balance in installments.

The Golden Rule of Tuolumne county, three-fourths sold to a Montana syndicate; purchase price unknown. The company is now enlarging their mill.

The Black Oak of Tuolumne county, Tom Ewing and associates the purchases; price paid, $108,000—$20,000 down, balance in installments.

Whitlock & Spencer, on Sherlock creek, in Mariposa county; the Sierra Buttes—An English syndicate the purchasers; price paid unkuown. The same system has also bought a group of mines in Calaveras county, price unknown.

New London Group—Situated near Plymouth, Amador county; N. J. Coleman, promoter of sale and superintendent. A mill in process of construction; price paid, unknown.

Oakland, Crown Point & Washington—Situated in the Meadow Lake Mining District, Nevada county; sold to a Salt Lake syndicate, price paid unknown.

Sommerville Group of Mines—Situated ou the ridge, eight miles from Robinson's Ferry, Tuolumne county; sold to a Denver syndicate for $100,000—$15,000 paid down, balance in installments.

The Blythe-Carr Gravel Mines, of Trinity county—Mather and Maitlaud the purchasers; price paid, $25,000.

The French Hill Mines, of Amador county, sold for $140,000; purchasers unknown.

The Boa Gravel Mine, of Yuba county, Timbuctoo district—Recently bought by Joseph D. Redding, the San Francisco attorney; the purchase price unknown.

The Hydraulic Mine, on the Trinity River, above Weaverville, Trinity county, known as the French La Grange purchase, are working a large force of men on new ditch and mine.

Seminole group, situated eight miles southeast from Sonora. Group consists of the Richards, Conley and Grizzly mines. Sold to John Cole et al. for $110,000. Ten stamps in operation and ten more to be added.

Burton group, situated on the Robinson Ferry road, one mile north of Tuttletown, Tuolumne county. Sold to a Montreal syndicate for $140,000. A payment of $15,000 has been made, and the balance in installments. A forty-stamp mill has been ordered for this mine.

The Four Hills mines, situated in Sierra county on the Plumas-Eureka belt, has been bought on Professor Atwood's report. Rosenberg, promoter. Mines sold to the Sierra Buttes Syndicate. Price paid in cash, $100,000.

The Cook mines, Mariposa county, near Coulterville. Sold to Thomas Fox and Thomas Couch of Montana. These mines are to be operated by electric power. The group consists of seventeen pateuted claims. Price paid, $100,000. Working

capital on deposit, $650,000. The principal owners reside in Boston, Mass.

Big Oak Flat Ditch—A company has bought this property, for which they paid $140,000.

The Phœnix, of Sierra county, has been sold to J. A. Fillmore and other officers of the Southern Pacific railroad. Price paid, $40,000.

The Mountain View, of Fresno county, has been sold by A. Wambold to a Chicago syndicate. Price paid, unknown.

Gold Ridge Consolidated, consisting of four quartz mines and 1500 acres of hydraulic ground, has been sold to Lilly Barstow and W. W. Pamfort, of New York. Price paid, unknown.

A group of six mines, lying northeast of the Sierra Buttes, S. P., has been bought by the English Mountain Consolidated Mining Company. Twenty thousand dollars has been paid on the purchase. Price, unknown.

A number of mines in Sierra county have been sold to an English syndicate for $450,000, the purchase price being deposited in and the business transacted through the Manhattan and Chemical Banks of New York.

The Mammoth mine of Grub Gulch, Madera county. One-half of this mine has been sold for $30,000 to parties unknown.

The Manhattan mine, owned by the English Lake Mining Company, has been sold to the Colorado Banking and Mining Association for the sum of $450,000.

The Chuparral Hill mines, near Angels, Calaveras county, have been sold to Mather & Jackson of New York for $500,000.

The Utica and Stickles mines of Calaveras county. It is reported that six and one-quarter millions of dollars have been offered and refused for these mines, the owners stating that they will not name a price for three months yet. These mines are yielding from four hundred to five hundred thousand dollars net per month. It is also reported that one million, two hundred and fifty thousand dollars have been offered for the Rawhide mine in Tuolumne county, and was refused.

Concentrates.

THE Defiance mine at Darwin, Cal., continues to ship ore in paying quantities.

A TRAMWAY is being constructed on the Grady group of mines in the Slocan country.

THE Sinaloa G. & S. M. Co. has incorporated at Los Angeles with an authorized capital stock of $100,000.

ARTHUR TINSLEY & Co. have been offered $50,000 for their Antimonium silver mines near Hunter creek, Or.

THE Samoan Mining Company has been incorporated, with $3000 capital stock, to operate in Mohave county, Arizona.

THE Corydon Gold Mining Company has been incorporated, to operate in Gunnison county, Col., with $400,000 capital stock.

W. F. ENGLEBRIGHT of Nevada City has bonded the Contact mine to S. P. Snider of Minnesota, who has men at work developing it.

IT is said that over $1,000,000 has been taken from the Jicarrilla placers, New Mexico, by panning with water melted from snow.

THE Redondo Mining Co., which recently incorporated with a capital of $500,000, will work three properties near Idaho Springs, Col.

THE Plethora Gold Mining and Milling Company has been incorporated, to operate in El Paso county, Col., with $500,000 capital stock.

THE Bridgeport Mining and Milling Company expect to have their machinery in place on their big mines in Okanogan county, Wash., soon.

THE stamp mill at Wenatchee, Wash., has been purchased by the Wenatchee Mining Company and moved to the mine on Quil Toe Chin creek.

PARK CITY, Utah, reports "a big bonanza" in the Comstock mine—a fifteen-foot vein, sixty-one per cent lead, forty-two ounces silver, and some gold.

THE gold received at the Melbourne Mint for the week ending August 25, 1894, was 24,795 ounces, and the value of gold coin and bullion issued, £123,049.

NEARLY all the Pueblo, Col., base bullion is separated at Argentine, near Kansas City, or near New York, where the gold, silver and lead are sold at market.

THE Wenatchee Mining Company has been incorporated at Wenatchee, Wash. Capital stock, $18,000. Incorporators—M. J. Carkeek, A. McIntosh, Thomas Burke.

THE Scott Mining Co. and the Columbia Mining Co. of Seattle have organized. The capital of the former is given at $100,000 and that of the latter at $1,000,000.

WILLIAM MAGE, of Cleveland, Ohio, and a syndicate of capitalists of that locality, will operate extensively in the rich mica deposits on Bear creek, near Volmer, Idaho.

THE California Debris Commission has issued a permit to Steele & Co. to operate a mine near Brownsville, Yuba county, by the hydraulic process. The permit is conditional.

THE Garner Consolidated Gold Mining Company has incorporated here. Directors—J. Stadtfeld Jr., W. C. Stadtfeld, A. F. Lejeal, Ralph Davis, Charles H. Fish. Capital stock, $120,000.

THE Arizona *Journal-Miner* says two concentrators are being put in at the mill of the Morning Glory Company, and that work in the mine is soon to be under way on a heavier scale than ever.

C. J. MOORE of Cripple Creek, Col., has a theory of the continuity of fissure veins in overlying eruptive rock extending on their strike into the granite, which he proposes to practically test.

THE Spokane and Pend d'Oreille Hydraulic Mining Company has been incorporated at Spokane, with a capital stock of $4000, by E. K. Erwin, F. R. Dow, L. C. Crawford, E. H. Hughes, Ad. Helmers.

THE purchase money for the Boston, Baxter, Sullivan, Columbia, Teller, Davidson, Madeline and Niwal mines, Boulder district, Colorado, is ready. The new company will issue $4,000,000 capital stock.

IT looks now as if the protracted litigation over the Waterloo mine, San Bernardino county, would be compromised, and the case taken out of court. The contest has gone on for many years, and has cost nearly $250,000 in that time. The Wisconsin owners of the Waterloo mine are tired of the litigation, and as soon as the English owners of the Silver King settle the question of debentures the suit will be compromised.

THE Reward Gold Mining Company has incorporated here with a capital of $1,000,000, of which $25,100 has been subscribed. Directors—F. W. Marvin, W. E. Stevens, W. T. Libby, G. C. King and James R. Smith.

THE Bolitho mine, situated one mile south of Angels Camp, owned by William Osborn, has been bonded by a San Francisco syndicate for the sum of $25,000, the company agreeing to sink a shaft on the mine 500 feet deep.

F. CLARNO has brought suit against G. W. Grayson for $75,000 alleged to be due him on the Virtue mine, Baker county, Or. Defendant claims that pluintiff has forfeited all former rights by abandonment and lapse of contract.

A RICH placer strike is reported near Mesquite, on the Southern Pacific railroad, sixty miles west of Yuma. The discoverers are John Peterson, Thomas Kniue and L. C. Moreland. The discovery, it is claimed, is an extremely rich one.

"BAYLEY'S REWARD," the pioneer claim of the Coolgardie, West Australia, gold field, yielded during the twelve months ending April 5th, £234,000 in gold. Since that date the present company has added approximately £60,000 more to the output.

THE Cleveland Mine, near Huckleberry, Lincoln county, Wash., has been bonded for $150,000, the terms of which call for the weekly shipment of six hundred tons of ore per week; values have jumped from hundreds to thousands of dollars in that section.

THE African Gold Recovery Company (Limited) announces that 56,258 ounces of gold have been recovered at the Rand, and 8000 ounces in other districts, a total of 64,258 ounces during August, by means of their cyanide process. The July total was 57,500 ounces.

THE Yuma, Arizona, *Times* says: Gold Rock is going to be better and livelier. A twenty-stamp mill will be put up on the claims adjoiniug the Golden Cross. If this is done sixty stamps will be dropping in the district and the monthly clean-up ought to be $50,000.

THE Morning mine at Mulleu, illustrated on the front page of this issue, will resume in about three weeks. Twelve men were put to work repairing the railroad between the mines and the mill the first of the week. This mine, when running, employs about 200 men.

THE company owniug the Cook property in Mariposa has incorporated under the name of the Merced Gold Mining Company. The owners are in Coulterville and have commenced work on their property. Men are at work near Benton mills for the purpose of taking water for electric power.

THE De Kaap district of the Transvaal produced 51,000 ounces of gold during the half-year to June 30th, the totals for the correspondiug halves of 1893, 1892, 1891, 1890 and 1889 being 31,000 ounces, 32,500 ounces, 28,000 ounces, 11,000 ounces, and 21,000 ounces. The Sheba mine alone returned 39,819 ounces.

THE revision of the mining laws for Mashonaland and Matabeleland has, says the London *Mining Journal*, been completed by the Administrator, Messrs. John Hays Hammond, and Wilson Fox. An Order in Council by the Secretary of State for the Colonies is, however, necessary before the said laws can come into operation.

ARTICLES of incorporation of the Plomoso Cement Mining Company have been filed at Yuma. The company is formed under the laws of Colorado to acquire mineral land and mill sites in Yuma county, Arizona. The capital stock is 300,000 shares having a par value of $1 each. The principal place of business will be at Tyson's Well, Arizona.

THE Boise County Mining Company has resumed work in search of deep placers near Idaho City, this time with a drill, by sinking in the old shaft which was down 115 feet. A total depth of 255 feet has been reached. The theory that that section of the country is underlaid with an auriferous gravel has set everybody there speculating as to the outcome.

ARTICLES of incorporation of the Allison Ranch Consolidated Mining Company have been filed in San Francisco. The directors are: Nat Messer, J. W. Twiggs, T. C. O'Conner, R. H. Follis, G. H. Waggener and James E. Walsh. The capital stock is $10,000,000, of which $9,009,500 has been subscribed by Walsh and the remainder by the other directors.

BY the decision of the United States Court of Private Land Claims all the mineral-bearing portion of the rich Cochiti district is declared to be public domain. The Canada de Cochiti grant, which claim has hung like a pall over that mineral belt since it was discovered last fall, and which claimed to cover 114,000 acres, is confirmed for only 3000 acres, and this is miles away from the mineral belt.

EVERYTHING points to a prosperous fall and winter in Creede, says the *Sentinel*. There are more mines working now than for the last year. Here is the list: New York, Last Chance, Bachelor, Commodore, Happy Thought, Park Regent, Ridge, Ethel, Nelson Tunnel, Schuylkill Tunnel, Alpha and Amethyst. The Presidential group in Phœnix park is being worked and there is talk of the Del Monte soon starting.

A CONTRACT has been made between the Tacoma Smelter Company and the Bunker Hill and Sullivan Mining and Concentrating Company of Wardner, Idaho, by which 800 tons of ore monthly, for six months, will be shipped from Wardner to Tacoma for smelting. The first shipment was made last week. The ore carries sixty-five per cent of lead and thirty ounces of silver to the ton. Part of it will be sent to the Selby smelter in this city.

THE Supreme Court has affirmed the decision in the case of McCormick vs. Baldwin, involving a mining claim on Gold Flat. McCormick attempted to hold mining claims by annually re-locating the same and on the first of January doing a few hours' work. Judge Caldwell instructed the jury that such was a sham and mere pretense, and not sufficient to hold the ground. The jury decided in favor of the defendants, and the Supreme Court has affirmed the verdict.

ARTICLES of incorporation of the Pike Dredging & Amalgamating Company have been filed at Helena, Montana. The incorporators are Charles A. Potter and Colonel O. C. Bosbyshell of Philadelphia, and William E. McConley, E. Abbott Todd and J. S. Sanderson of Springfield, Mass. The company will conduct a general mining and smelting business in Montana, with headquarters at Helena. A branch office will be opened in Philadelphia. The company is capitalized at $1,000,000.

THE theory that free gold quartz does not exist on the western slope of the Cascades has been exploded by the discovery of the Leroy group of claims a short distance southwest of Monte Cristo, says the Snohomish *Eye*. A nugget valued at about seventy-five cents was picked out of a piece of the quartz. The ledge is said to be a mammoth one, and is located at an elevation of over 5000 feet. It has been prospected with several tunnels, in all of which the free gold quartz is shown.

AT Clements, San Joaquin Co., a prospector named Nixon had been mining on land belonging to one Giles. After spending considerable of his own money, and nobody else's, he struck a rich lead and told Giles of his discovery. Giles then warned Nixon off the land. Nixon said that he might as well be without brains as without money, and Giles then turned loose a six-shooter, putting two holes through Nixon's coat. Nixon responded with one shot, when bystanders interfered. Nixon was arrested, thus adding insult to injury.

ADVICES from Chile say that in Coquimbo the gold fever continues developing. Andacallo is not the only place at which gold has been struck, but at Cruz de Caras also, where the range is in a virgin state. In many parts of the province of Anoud gold has also been struck. A man named Arana recently obtained, with fifteen men, in that number of days, $8000 worth of the yellow metal. The gold is said to be very fine, and the indications are that it exists in great quantities. A rush has set in from all parts in consequence.

THE largest and most important mining transaction that has taken place in that vicinity in the past three years has been closed, involving the transfer of five partially developed gold properties in Hell canyon, eighteen miles southeast of Albuquerque, for a consideration of $340,000. The deal was made by H. A. Howard of San Diego for New York parties. Two of the mines are old properties, now free from litigation. The group covers the largest body of free-milling, low-grade gold ore known in that country. Plans are laid for erecting a mill of 100 stamps.

AT Nelson, B. C., last week a verdict was brought in in the case of Hendricks and Hayward against Hennessy Bros. The Hennessys discovered and located the Noble Five group and other prospects in the Slocan mining district, being the original discoverers of that camp. Hendricks and Haywurd claimed that they grub-staked the discoverers and brought suit for a fifth interest. The Hennessys denied the grub-stake. The jury found that William Hennessy was grub-staked, but not John. This gives the plaintiffs a tenth interest in the group, said to be worth from $500,000 to $1,000,000.

THE Copper Queen Company, at Bisbee, Arizona, is reported to be working 400 men, and producing twenty-five tons of copper per day from 250,000 pounds of ore. The company continues to pay dividends regularly. The underground workings are almost interminable. There are over sixty miles of tunnels and thirty-six miles of undergrouud track. The supply of ore is sufficient to last for many years to come. The new converters, which are to extract the sulphur from the copper, are in course of erection. The impure copper will be run from the furnace into the converters, where it will be subjected to an intense heat, and a twelve-inch current of air will be sent through the converter at a velocity that will drive all the sulphur out of the copper.

A BIG mining deal is reported to be nearing consummation. Agents of an English syndicate are now in the Cœur d'Alenes concluding negotiations for the purchase of four of the most valuable properties—the Poorman, Tiger, Gem and Frisco mines. The plan is to operate them under one management, thus not only reducing the expenses of working the properties, but placing the owners in a position to dictate freight rates, smelter charges, etc., to suit themselves. The figures offered can not be learned, but the company is reputed to have £500,000 at its command. Should the sale be effected, a period of unprecedented activity is predicted for the Cœur d'Alenes. It is believed the winter will be spent in developing work and the improvement of the working plant.

IN the Caledonia mine, says the Victor, Col., *News*, the owner of the lease is working all the men he can find room for. He is doing nothing on the shaft, but is confining his efforts to a trench near the surface. Ore is being taken out of the trench, six feet from the surface, running into the hundreds, and the surface of the ore chute, which is 100 feet wide, is yielding $60 to the ton. A few days ago one of the employes of the mine took a couple of handfulls of clay from the walls of the trench and on panning he got $2.50 worth of gold. The men were at once set to work scraping the clay off with their jack-knives, and $150 was secured in that way. There would seem to be some hope of financial salvation in a State in which so profitable mining can be done so simply and so easily.

TWO MILLION OUNCES of gold! This, says the *Standard*, is the wonderful record which the Witwatersrand gold-field is likely to put up before the close of 1894. The figures for the first six months of the year are 973,737 ounces—in itself a truly remarkable achievement. To produce this return, 2200 head of stamps have been hammering away night and day reducing to powder no less than 1,370,240 tons of ore, and the cyanide process has treated 1,212,929 tons of tailings for a yield of between four dwt. and five dwt. of gold to the ton. A noticeable feature of this huge work is the evenness of the yield, the average for the six months having remained at 9.34 dwt. The great ambition of the Rand for a long time was to obtain 150,000 ounces as the month's output. This was realized early in the year. The endeavor now is to make the record 200,000 ounces, and it is quite expected this will be recorded ere another half year has closed.

Personal.

WM. PRESTON, director of the U. S. Mint, is at Denver, and may come this far.

G. W. GRAYSON has returned from a visit to his property, the Virtue mine, Baker City, Or.

Methods of Mine Timbering.

NUMBER V.—CONCLUDED.

The sketch of the Caledouia miue, iu the Black Hills, S. D., represeuts the mine as it appeared in the spring of 1883. The main shaft was sunk in the large veiu, the hoisting works being located on the adit level, 200 feet from the surface, vertical measurement, and 820 feet from the mouth of the tunnel. This shaft reached the footwall on the 300-foot level, and a large stope was at ouce opened around the shaft, a pillar of ore thirty feet sqnare being left to support it. The shaft was continued vertically to the 400-foot level and an extensive stope opeued there also. The gold-bearing rock of the Caledonia is hard white quartz, whicb occurs in bunches and reticulated veins in chloritic schist, and in this respect resembles some California mines, as tbe Utica-Stickles, Gover, and some others. In the Caledonia great headers were excavated in advance of placing the square sets. Tbe timbers were all properly framed and were massive, but there was a disregard of what were considered the minor unecessary details in placing them, particularly on the walls and against the roof. As these large stopes were extended, too broad an area was takeu out at one time, aud the superincumbent weight at length threw the timbers out of line, and almost witbout waruiug the mine caved, the immense timbers "jack-knifing" aud snapping like reeds. Thousands of tons of ore, the expensive machinery, and a mass of splintered timbers were dumped in a chaotic mass to the bottom of the 400-foot level. There were three causes which led up to this disaster: The extractiou at one time of too large an area of grouud; carelessness iu timbering, and the slippery nature of the footwall (talc scbist), which afforded a poor support to the large pillar of ore.

It is unreasonable to expect a frame of timbers, however strong, to support the weight of a mountain of rock, and for that reason discretion should be used in extracting large bodies of ore. It is hazardous to attempt to remove a section more than three or four sets wide at one time from the floor of one level to that next above. A breast may extend entirely across the deposit or vein, but if more thau four sets in width are removed at one time it allows too much weight to fall upou the timbers, and the probability of a cave is greatly increased.

By taking out a section, which may extend eutirely across the vein or deposit, three or four sets wide, and carrying the stope up somewhat in the form of a pyramid, so that on nearing the floor next above only the space of a single set or, at most, not more than two, be at first removed, and the timbers firmly wedged to the sills before enlarging the excavatiou at that point, all the ore may be extracted, and the operation in this manner is atteuded by the least expense and danger. When a section has been mined out from level to level as described, a secoud section may be attempted. Under all ordinary circumstances it will be found that the timbers will usually support the ground until the stopes can be filled with waste. At many mines waste is obtained on the surface, and in some the opening of large chambers in the hanging wall is necessary to obtaiu a sufficient amount of material for filliug the stopes. There is always danger in the removal of a mass of rock which stands ou a base that is broader than its upper portion, or apex, like the letter "A," while on the other hand a "V"-shaped mass is largely supported by the walls. Many ore bodies are lens-shaped; that is, broader at the center than those portious either above or below, and iu these masses the greatest expeuse and dauger atteud the removal of the upper portion.

In building square sets, the sills, sixteen to twenty feet in length, are first laid down on the floor at right angles to the walls. These timbers are the largest in use in the mine, and should properly be as long as they can be handled. At regular intervals shallow depressions are cut across the upper face of the timber one inch in depth and superficially the same size as the posts which are to rest upou the sill. In the center is cut a mortise, two-thirds the square of the post, at least 6x6, and larger as the size of the timber is increased. Into the mortise a tenon on the bottom of the post fits nicely. The sills are laid horizontally and exactly parallel, at such distances as may have beeu determined upon, usually five or six feet from the center to center of the posts. The sets may be placed in the form of squares or rectaugles. Two sills having been laid, four posts, constituting the four coruers of a set, may be placed iu position. They may be of greater length than the posts of sets above, the object being to afford more room overhead on the sill floor, if desirable. A temporary platform is constructed by spiking stout planks to the two sets of posts at right angles to the sills and placiug on them planks or lagging. This staging is built at a suitable height, to enable the men standing thereon to lift the heavy caps and place the ends upon the posts. The caps are placed directly above the sills; that is, iu a direction extending from wall to wall.

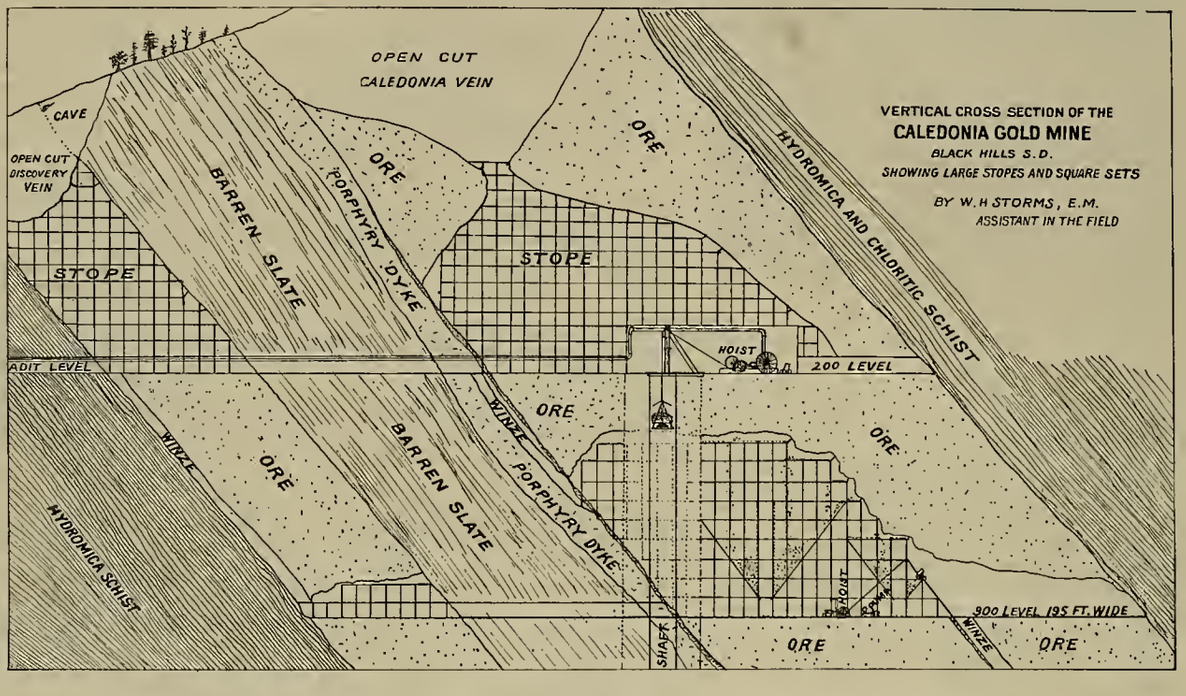
Each post is framed with a tenon both top and bottom; that at the upper end being two-thirds or three-fourths, and that at the bottom, one-third or one-fourth the thickness of the eap. It is necessary that tbe bottom of eacb post sball rest directly upon tbe top of tbat in the set next below. All the timbers must be carefully framed or it will be found that they will uot join properly.

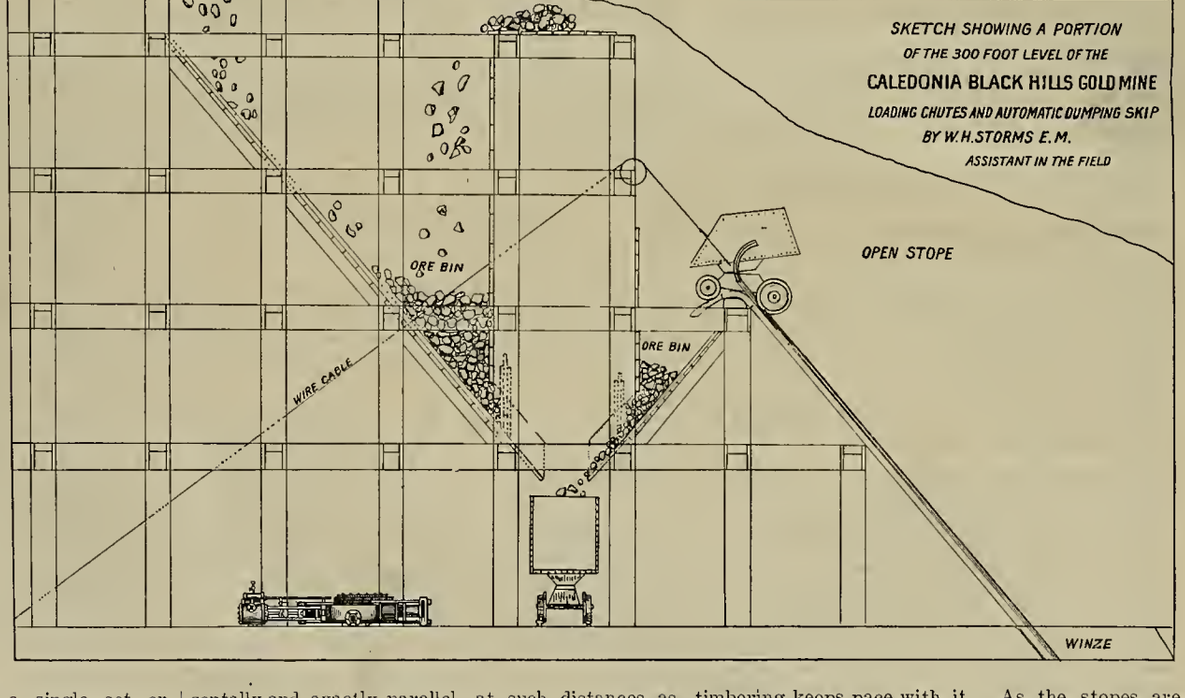
Having placed caps upon the posts, the ties may also be lifted into position, crossing from post to post and resting upon them in the same manner as the caps, but at right angles to them. The broad side is laid upward, the width of which is equal to that of the post, which is square. The tie is equal to the smaller widtb of the cap. Tbe ties should fit tightly, aud if they do not, must be secured by wedging at the ends. The best results are obtained when it is necessary to drive the ties down with mauls.

As the work of extracting the ore proceeds the timbering keeps pace with it. As the stopes are carried upward, set is built upon set, reaching from one level to another. Temporary working floors are laid, split laggiug beiug used for this purpose. These floors are moved from time to time as the work progresses. Ore broken down on these floors is shoveled into the bins beneath, or onto the sill floor before the bins have been provided, and from there shoveled or dumped into cars and sent to the surface.

When timbers have beeu placed the wedges along the walls should be driven up between the plates and walls, and in all other places where needed, to secure firmness aud rigidity, and some one man should be detailed to look after them and see that they remain so; for in large stopes the ground is constautly shifting more or less, and the weight being transferred from one point to another causes the wedges to loosen, when they must be again tightened to insure safety.

The size of timbers used in tbe square-set system ranges from 8x8 or 8x10 inches to 24x28 inches, though timbers of the latter dimensions are often





difficult to obtain. When such massive timbers cannot be had, the sets may be constructed on a smaller scale, having a lesser distance between posts, and also less height to the set; thus greater strength is secured by the employment of a larger number of timbers.

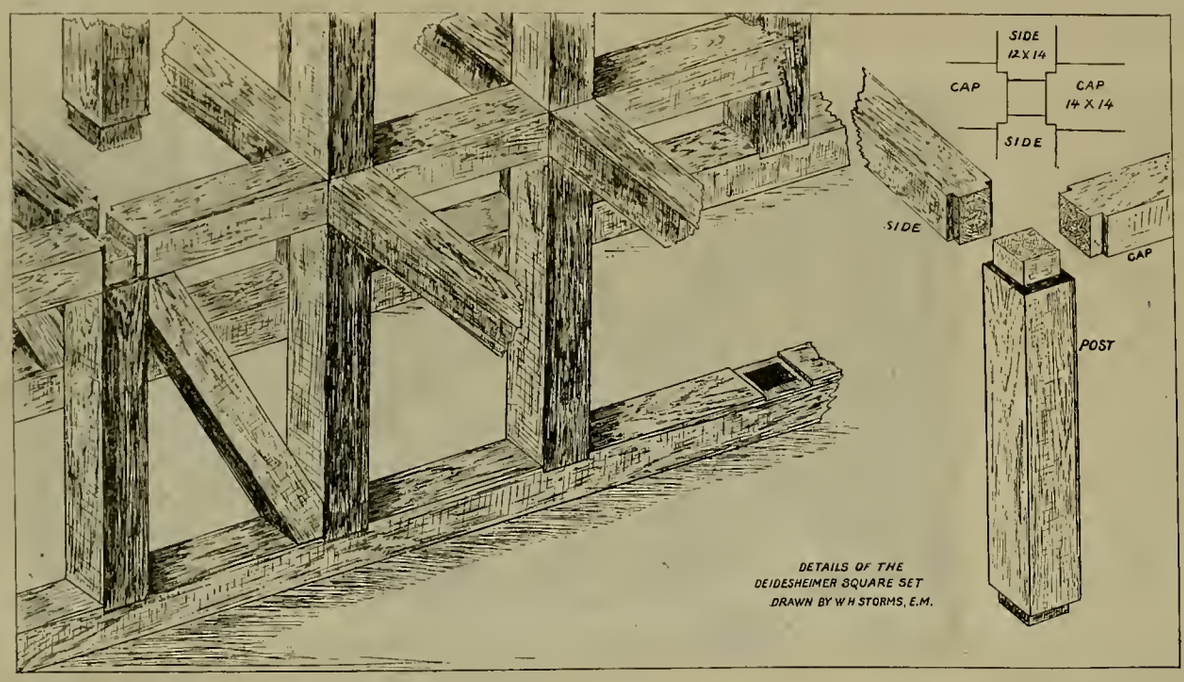
Caps encroach upon the posts two to six inches according to their dimensions, while ties have a rest of one to four inches, this being also determined by the size of the timbers. The posts are framed in accordance with the dimensions determined upon, which must be constant, to secure uniformity, whether the post be 16x16 or 24x24. As all caps are of the same length and all ties of an equal length, it is evident that if the tenons on the posts vary with any difference in the size of the posts (should any difference occur), the system would soon be out of line. As the timbers used are all sawed, it should not be difficult to secure them, having a uniform size for any single stope. In any event, the tenons at the top and bottom of the post must have a uniform size regardless of the dimensions of the post. For instance, should eighteen-inch posts be in use on any particular level framed with twelve-inch tenons, if from necessity or choice a twenty-inch or twenty-four-inch post be introduced in the sets, it must have a twelve-inch tenon, corresponding with the others. Square timbers are usually framed with gang saws, and are therefore uniform, and any particular stick, whether post, cap, or tie, may be used in any portion of the mine.

Posts and caps which come in contact with the wall plate are mostly framed by hand, to order, careful measurement having first been made to determine the exact dimensions. Caps which meet the plate within less than two-thirds the width of the set are frequently made continuous from the second post. Wall plates are cut in sections, the length of which is determined by the conditions in the mine. These are also mostly framed by hand. The manner of framing and fitting these timbers will be understood by reference to the drawings.

Cap sills are often used in preference to wall plates on the footwall of a vein. They are applicable to small stopes as well as great chambers. As the name implies, these timbers are simply an extension of the cap from the post nearest the footwall to the wall where it rests upon a hitch cut in the wall (two feet or more, according to the character of the ground.) It then forms a sill for the post of the set next above, as illustrated in the accompanying drawing.

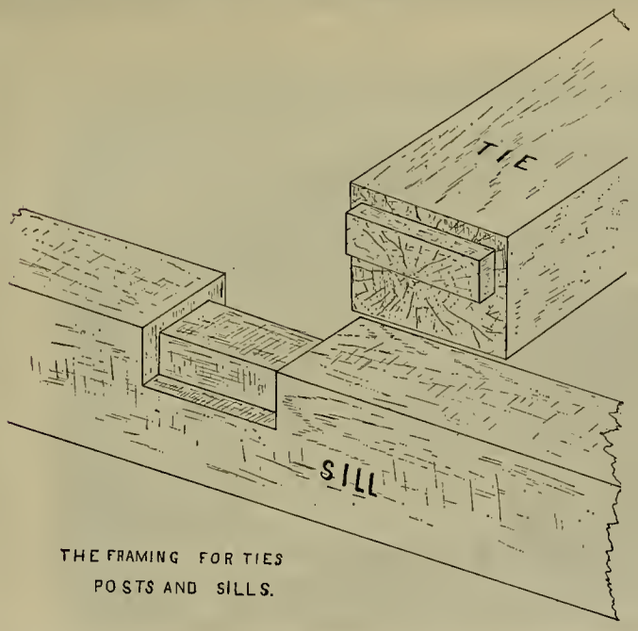
The method commonly in use for cutting a seat for a post in the sill: that of cutting a section an inch deep entirely across the face of the sill, in the center of which is a mortise to admit the tenon of the post, has been superseded in some mines by a new practice, which has many advantages, particularly the ease with which all rock and other foreign substance may be removed when ready to set the post. The tie or girt is let in on each side, they being cut out to the depth of one inch at the ends. The drawing will explain the idea better than a description. The posts have a tenon one inch only in depth. A longer tenon would afford no additional security or firmness.

A great deal of good ore is sometimes lost by the settling of large veins upon the timbers of the first few floors of a stope so heavily as to throw the timbers out of line, when bulkheading and filling in must at once be resorted to to prevent caving. In the Anaconda mine of Butte City, Montana, a case of this kind occurred. The timbers on the sill floor were forced out of line, and it was evident that a disastrous cave was imminent. The stope was packed full of timber and waste as rapidly as possible and the level abandoned. A drift was then run from a crosscut in the footwall, sixty feet from the vein, and in this lateral drift at distances of sixty feet, and directly opposite the chutes in the abandoned stope, as established by the mine surveyor, a square set was placed. A raise was then carried up on an incline to the vein, where it was still intact above the filled stope from each of these points. These raises were timbered with square sets, which in section would present the appearance of a series of steps. The rock in which the drift was run was solid granite; but, as the footwall was approached, it was much decomposed and required substantial timbering. Had the footwall country rock been firm and hard, no timber would have been necessary, except at the stand on the floor of the drift where the loading chute was constructed and at the junction of the winze and footwall of the vein. Through the winzes thus made, the lost ore was almost entirely recovered.

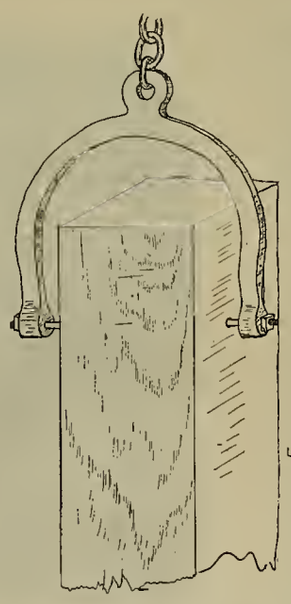


Diagonal braces are necessary in heavy ground. It must be borne in mind that they, in a measure, perform the office of stulls, and should not be placed at right angles to the hanging-wall, but at a higher angle. For instance, supposing the inclination of the hanging-wall to be forty-five degrees, the diagonal braces should stand at fifty-five degrees. The height and width of the sets must be determined by the desired inclination to be given the diagonal or angle braces, and before this can be determined the inclination of the hanging-wall must be known. The angle braces may be of the same size as the posts, or a little smaller. These timbers are not mortised nor framed with tenons, but are slipped in sideways and secured by thin wedges if they are not tight when put in place.

When the pressure is greater, apparently, from the side than from overhead, the method of framing and joining these timbers is somewhat different. The cap becomes the post. The tenons at each end of the cap in this case are exactly the same size, while the tie is also provided with a tenon, but of different style from that used where the timbers are framed to resist top pressure. The placing of wall plates and angle braces is the same in each system.



THE FRAMING FOR TIES POSTS AND SILLS.



DEVICE FOR LOWERING TIMBER UNDER THE CAGE OR SKIP.

It frequently occurs that bulkheads of solid timber, or cribs filled with rock, have to be built to sustain sinking roofs which have already been substantially timbered. Bulkheads are formed by laying massive squared timbers side by side, filling the space between sets. Upon these are laid a second layer at right angles to the first, and so on from floor to roof of the stope. Cribs are constructed by building up timbers in the form of a hollow square or rectangle, the interior space being filled with large broken rock, and also extends from floor to roof. Either of these devices forms a very substantial support to settling ground, though sometimes inefficient.

Bulkheads of solid masonry are sometimes built in mine workings to stop a heavy influx of water. They should be constructed with the greatest care and in the most substantial manner possible to prevent future collapse. When it becomes necessary to build a bulkhead of this kind a section should be cut in the floor, sides and roof of the drift, and the masonry extended into these spaces. Water bulkheads are sometimes built of dry timbers, which, swelling, effectually shut off the influx of water.

An instance recently came to the knowledge of the writer in which a large flow of water followed the cutting of a subterranean reservoir by a power drill. As usual in such cases, wooden plugs were inserted and driven in, but to no purpose, the force of the water driving them out. The protection of a bulkhead seemed necessary to prevent the flooding of the mine. An experiment was first tried, which, proving successful, rendered the bulkhead unnecessary. A section of pipe provided with a globe valve was inserted in the hole, the valve remaining open until the pipe was firmly secured by wooden braces and tightly wedged in the rock. The valve was then closed and the flow shut off. Provision then being

made to haudle the water, the valve was opened partly and the reservoir drained. It seems that this plan might be adopted with advantage where the influx of water interferes with the construction and completion of a water-tight bulkhead, for at times the flow of water is so great that it is almost impossible to construct a bulkhead, owing to the pressure of the water back of it.

The largest known body of ore in California to-day is in the Utica-Stickles mine, Angels Camp, Calaveras county. Its exteut is, as yet, unknown. The workiugs have thus far exposed a mass of gold-bearing rock rauging from forty to more than 100 feet broad, over 400 feet high, and exceeding 1000 feet in length. Stopes of this size require a very substantial system of timbering, and the square-set system, which has been described at length, is exactly suited to its reqnirements. It is not in use, however, but in its stead another system, which is quite similar and based on exactly the same priuciples, still having very important differences.

The timber used in this mine is exclusively round, peeled pine logs, which are delivered by contract at the surface works. The cost of these logs, I am informed, is ten cents for each inch of diameter, making a sixteen-foot eighteen-inch log cost $1.80, and a twenty-four inch log $2.40. These timbers are all cnt into two lengths of eight feet each. They are mostly over eighteen inches in diameter, and occasionally are found as large as twenty-eight and thirty inches in diameter. The posts are framed to fourteen inches, top aud bottom, the tenon being four inches high. Caps are framed to fourteen iuches at either end, the tenon beiug six inches long. Thus it will be seen when two adjacent caps are placed on a post the tenous will not meet, but will have a two-inch space between them. This space is filled by driving in a section of two-inch plank fourteen inches square. At the junction of caps and posts are two ties in place of one, as in the square-set system. These ties rauge from a foot to sixteen inches in diameter and are about four feet in length. The lower one has a horn four inches in length on its upper half. These projections rest upon the shoulders of the posts. The upper tie is tightly wedged between the posts. This system has replaced that formerly in use at the Utica miue, in which the posts were sixteeu feet high, caps being let into the sides at eight feet and others resting on the top. The new system is much preferred and has many advantages over the old (a thirty-inch post sixteen fect in length weighed over 3300 pounds). In the present system the posts aud caps weigh from 700 to over 1000 pounds each.

Owing to the impossibility of procuring round timbers that are exactly uniform in size, the Utica system involves a vast amount of dressing timbers underground to secure the necessary uniformity in joining. While the system is one affording great strength when properly placed, it would seem to possess uo advantages over the square-set system, and to be more troublesome, cumbersome, and, in the writer's opinion, more expensive thau the latter, though the first eost of round timber is less than that of sawed square timber.

No wall plates, excepting short siugle pieces, are employed, and no sills are laid upou the levels of the floors. It would appear that neglect to provide sills will in time prove a great disadvantage in connecting the stopes from level to level.

The mauner of handliug timbers at mines depends to a great extent on the size and number of timbers used, and ou the character of the shaft, whether it be vertical or inclined. In drift mines and mineral deposits which lie nearly horizontal they are set in on flat cars (trolleys) built for the purpose. When cages are used in vertical shafts the timbers are set upright on the floor of the cage, lashed together, and lowered into the mine. At inclines it is a common practice to load the timbers into the skip and lower them down the shaft in that way to the desired point.

At the Utica mine the heavy timbers are haudled quickly and easily on the surface. They are sent from the framing machine to the shafts ou trolleys. Two men are kept busy a great deal of the time in sending timbers undergrouud. A number of stout chains eight feet iu length are provided. In the center of each chain is a four-iuch ring, and at each eud a dog, having a point projectiug at about seveuty degrees four inches in length. One of these dogs is driveu iuto the side of a post or cap somewhat above the center. The chain is passed over the eud of the timber and the other dog is driven into the opposite side. A spike six or eight inches long, having a five-foot piece of rope attached, is driveu well into the lower skips of the timber, and it is ready to lower into the miue. Beneath the skips are stout chains with rings. An extra chain having hooks at the ends is at hand. This forms the conuecting link between the chain beneath the skip aud that attached to the timber. Having been securely hooked the skip is raised slowly, lifting the timber from the platform. The rope and spike at the bottom are used to bring the timber to a standstill before the skip is lowered. Having reached the level where it is wanted the rope again comes into use in landing the timber at the station.

The Utica shaft is almost vertical. This process, while a conveuient aud quick way of handling these heavy timbers, cannot well be used in shafts departing very far from the perpendicular, unless a slide of plauk be laid between the guides or runway of the skip, and it would then be advisable to line the slides with strips of flat iron. It would appear that timbers might be handled in this mauner in shafts having as low au inclination as thirty-five degrees, particularly if the slide be lubricated. It is certainly a superior method to that of loading the timbers into skips, which involves much difficulty, particularly in lauding them at stations. Most mines have blocks and tackle at the stations, secured to heavy timbers overhead, for unloadiug timbers from skips.

It is always a good plau, where possible, to have complete connection from level to level by means of winzes in veins requiring very large timbers. The timbers may then be unloaded on the level above where they are to be used and lowered through the winze nearest the stope where they are to be placed, and to the particular floor of the stope where they are required. Winzes for this purpose should have, if possible, au inclination of sixty-five degrees. Where the slope is too low for them to run, however, the timbers may be dragged down, which is certainly much cheaper and easier thau hauling them up.

All timbers should be framed on the surface where possible, as it saves much time and trouble. Gang saws are much to be preferred to auy other method of framiug timbers for square sets. The timbers can, iu this way, be framed as exactly, if not more so, than by haud, aud in one-tenth of the tiue.

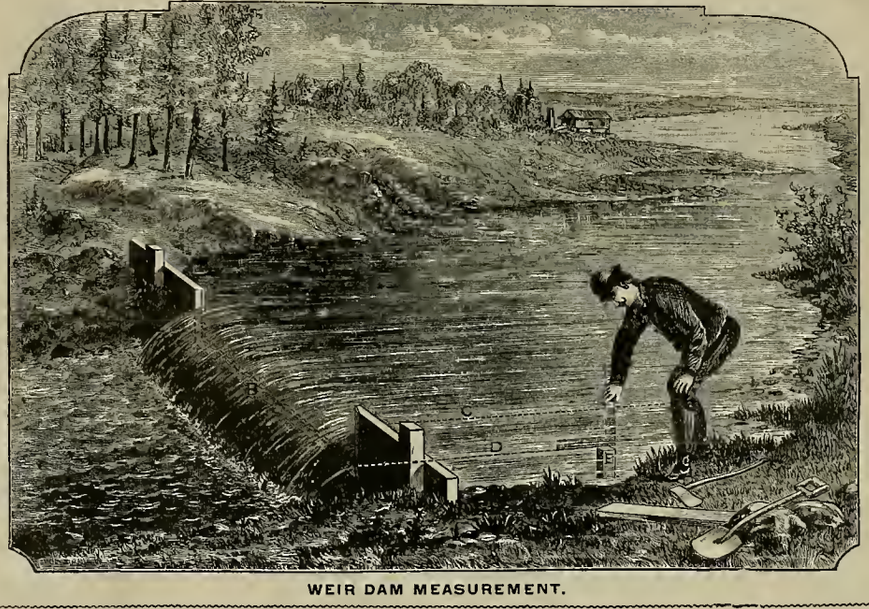
In mines where cages are used, when it is necessary to send long timbers down iuto the mine, as sills for square sets, or long plates, much time is saved by boring an auger hole through the timber near the end and passing an iron bar (⅞-inch) throngh it. The ends of the bar are provided with threads and nuts. These ends pass through the ends of a U-shaped frame, forming a large clevis. The clevis is attached by a chain to the bottom of the cage, and in this manner lowered to the point desired. The principle is the same as that employed at the Utica mine. The drawing herewith will convey an idea of the device above described.

Measurement by Miners' Inch.

"A miner's inch" is not a fixed quantity, the term being iudefinite, its exact applicatiou being of local determination. It is primarily a pressure measure, and it is on that questiou of pressure hinges the difference in the several modes of measuring by what is usually called "a miner's inch." All are agreed that is the amount of water that will pass in twenty-four hours through an opeuing one iuch square, the difference in custom being the amount of pressure or the depth of the center of the openiug below the water line. If four inches, the delivery is calculated to be 538½ gallons per hour; if six inches, abont 600 gallons per hour. While, of course, the greater the pressure the greater the flow, the matter is neccssarily largely one of theory, deducted from the flow occasioned by the laws of gravity, aud influenced by the manner of delivery, the nature of the edges of the hole, the head of water above the hole, etc., so that exactness caunot be reached. Then, again, there are ten, eleven and twelve-hour inches, and a twenty-four-hour inch.

A Smartsville, Cal., iuch is calculated on the discharge of water through a four-inch hole with a seven-inch board top, thus passing through 1.78 cubic feet per minute. The La Grange Ditch Co., Miltou Ditch Co., and North Bloomfield B. G. M. Co.

MINER'S INCH MEASUREMENT.



WEIR DAM MEASUREMENT.

measured an opening 2x1½ inches, six-inch pressure, giving 1.575 cubic feet per minute. Other companies in California measured in different ways, the theoretical number of cubic feet discharging varying from 1.78 per minute in the case of the Smartsville inch to 1.40 in Amador county.

It was long since deemed of sufficient importance to be legally defined, and the State sets "a miner's inch" at that quantity of water which will flow through an opening of one square inch in the bottom or side of a vessel, under a pressure of four inches above an opening. According to this, fifty of the above miners' inches are equivalent to a discharge of one cubic foot of water per second.

To get the number of gallons in miners' inches, multiply the given number of inches by 14.961, pointing off five decimals. The result will be the number of gallons discharged per second.

To get the miners' inch in gallons, divide the number of gallons flow, or discharge per minute, by 8.9766. The result will be the number of inches sought.

One miners' inch in gallons per second is..	0.1496
Per minute	8.976
Per hour	538.56
Per day	12,925.44
Per month	293,418
Per year	4,721,017

It is believed, however, that for all practical purposes it may be assumed that a miner's inch will discharge in one minute 1.57 cubic feet.

The accompanying illustration is of an opening, fifty inches long and two inches wide, in a two-inch board; the opening being from its center to the surface of the water seven inches, or from the top of the opening to the surface, six inches. The opening represents 100 miners' inches, which will discharge 157 cubic feet per minute, ascertained upon reliable and practical experiments by competent engineers. When the opening is narrower or wider, the discharge will differ slightly from that stated; being more with larger and longer openings, and less with smaller and shorter ones, but sufficiently close in estimating for any size of stream adapted to this method.

The illustration shows an aperture fifty inches long, two inches wide, through a two-inch board, the outside lower edge of the board being chamfered an inch. The slot is shown one-half drawn open; but the board or gate, which slides by means of a rabbit or a shoulder upon the top board, carries a piece fastened to its end, which slides back and forth in the slot, making the spill of water more or less in width, to suit the size of stream, or to keep the depth of water over this notch, exactly six inches from the surface to the upper edge of the notch. A colored line may be painted on the up-stream side of the board, giving the exact height above the notch, or the board itself may be so located that the width of it above the notch is exactly six inches. The moment the water begins to spill over the board the gate can be further drawn and the opening increased, until precisely the quantity issues through the opening that will hold the water at the top level of the dam or board, or at the line drawn upon it, to represent the distance above the slot or mortise in the board.

When the gate has been sufficiently drawn, or properly adjusted by means of its handle, so that the upper level of the water will stand exactly at the line, the length of the opening through which the water is passing can be easily measured. This length, multiplied by the two inches opening, gives the exact number of miners' inches. As an instance, if the gate is sufficiently drawn to make the opening thirty inches long, through which the water is spilling, there will be sixty miners' inches. As the notch is two inches wide, multiplying the thirty inches by two obtains the sixty square inches, or sixty miners' inches. Assuming that each miners' inch will discharge 1.57 cubic feet, there will pass sixty times that quantity, or nearly ninety-five and two-tenths cubic feet per minute.

For irrigation purposes water is sold in this State by the cubic foot a second, or the miners' inch, or the thousand gallons, the latter being deceptive and unsatisfactory. With the irrigator, the standard measure of water is the cubic foot a second, or "second foot," as it is often called. In a ditch a foot wide and a foot deep, in which the average velocity (not the top or center velocity) was one foot a second, it would give a cubic foot a second. If the velocity were two feet a second it would give two feet a second, and so on.

On account of the difficulty of getting the average velocity, water in considerable quantities has to be measured with a weir or the fall over a sharp-edged board from a still pond. But this is inconvenient for small quantities, and it is not always convenient to make a pond large enough to deaden the velocity of the stream to a stillness reliable for accurate measurement. It was because of this that the miners in early days adopted the pressure measure—the miners' inch.

A discount of about thirty-six per cent is made for the twisting of the water and other resistance to its discharge, which leaves a flow of 13,000 gallons a day, nine gallons a minute or 540 gallons an hour. These are in round numbers, which will be used all through for convenience. They vary a trifle not worth considering and only make them harder to remember.

This is a convenient measure because it is one-fiftieth of a cubic foot a second. It amounts to 620,000 cubic feet a year, which equals 4,750,000 gallons. This will cover an acre over fourteen feet deep in a year, and cover ten acres about eighteen inches deep. This would give to ten acres six irrigations of three inches each, which would be more effective than six rains of three inches each, as they generally come.

One miner's inch will flood

10.00 acres per year	1.45 ft. deep
14.49 " " "	1.00 ft. deep
18.11 " " "	9.00 in. deep

In the measurement of water in a stream the weir dam method, herewith illustrated, is deemed of value.

It is first necessary to know the amount of head and fall that can be secured. The next step is to ascertain the quantity of water the stream affords. The quantity of water can be closely estimated by the following suggestions and the illustration. Use a board long enough to reach across the stream, with each end set in the bank. Cut a notch in the board, deep enough to pass all the water and long enough to reach about two-thirds across the stream. The bottom ends of the notch *B* in the board should be beveled on the down stream side, leaving the upper edge almost sharp. The stake *E* should be driven in the bottom of the stream several feet above the board on a level with the notch *B*, this level being easily found when the water is beginning to spill over the board.

After the water has come to a stand and reached its greatest depth, a careful measurement can be made of the depth of water over the top of stake *E*. Such measurement gives the true depth of water passing over the notch, because if measured directly on the notch the curvature of water would reduce the depth. The line *D* is a level from the bottom of notch *B* to the top of stake *E*, while the dotted line *C* represents the top of the water, and the distance between the lines gives the true depth or spill over the weir board. The line *D* has the appearance of running over the top of the board, when, in fact, it passes behind it—the reader is supposed to look through the board and the post. The surface of water after passing below the board should not be nearer the notch *B* than ten inches. Neither should the nature of the channel above the board be such as to force or hurry the water to the board, but should be amply wide and deep to allow the water to approach the notch quietly. If it passes the channel rapidly it will be forced over the notch and a larger quantity will pass than is desired.

Suppose the notch in the board is twenty inches wide, and the water at the stake *E* five and a half inches deep. Then 5.18 cubic feet is the quantity of water passing for each inch in width; since the supposed weir is twenty inches, this result must be multiplied by twenty, which gives 103.6 cubic feet per minute.

An important matter in measuring small streams is the possibility of damming or holding the water, and using it a part of the time instead of constantly. If the water is held for twelve hours, and the whole quantity used in the next twelve hours, with the supply that the stream affords in the same time, the power of the stream would be doubled, for the twelve hours, and give a better effect than if used constantly.

Arsenic Mining.

There are many points of interest in the way in which arsenic is obtained from one of the most famous mines in England, the Devon Great Consols. The mine was originally worked for copper alone, and would have been abandoned but for the discovery that the waste thrown out as worthless when copper was sought, proved rich in arsenic. Although copper is still raised, it is in small quantities, and the mine has been resolved into an arsenic works. The arsenic pyrites consist of 25 to 30 per cent. of iron, 12½ to 14 per cent of arsenic, and the rest of earthy matter.

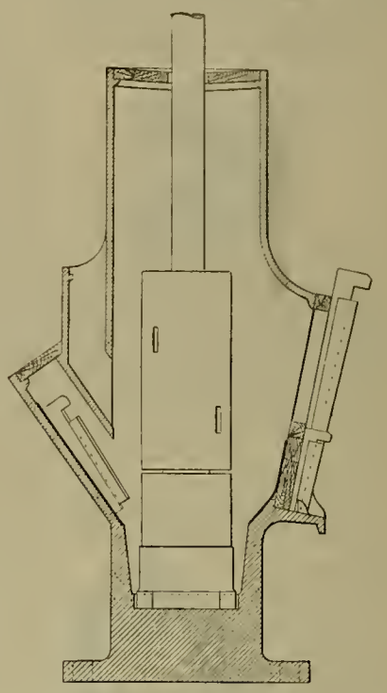
After being crushed this is sorted by girls from 13 to 16 years of age. It is then washed and "jigged" or sifted, and then passed on to the first calciner, where it is burned with low-class coal, and produces "arsenic soot"—that is, arsenic so mixed with smoke from the coal as to be of a gray color.

The arsenic and soot, deposited in combination in the chimney or coudenser, are scraped out and taken to the second calciner for purification. The calciners consist of revolving iron drums, through which a fire of anthracite coal is carried on rotating iron furnaces kept red hot. As the arsenical soot is subjected to the influence of this heat the arsenic is sublimed and condensed. The operation has to be carefully watched, and if the workmen burn the arsenic badly they have to pay for it.

The arsenic is liable to produce sores if permitted to lodge in wrinkles and folds of the flesh, or about the mouth or nostrils. As a rule, however, this only happens when there is carelessness as to personal cleanliness, and the arsenic workers simply have to wash themselves throughly every day on returning from work. Otherwise the work is considered healthy.

A New Gold Mortar.

The accompanying cut represents a combination mortar, manufactured by the Edward P. Allis Co., Milwaukee, Wis., designed for wet crushing, either with or without amalgamation. This style of mortar is desirable especially in custom mills where ores are worked either by amalgamation or concentration, or



both. When used for gold amalgamation, it is fitted with front and back coppers. The front opening or discharge of the mortar is fitted with a chuck-block below the screen frame, to which the front copper is attached. As the dies wear down, this chuck-block is replaced by a narrower one to keep the height of the die and the level of discharge relatively the same, which is an important feature in the amalgamation of gold in a mortar. The back copper is accessible from the back of the mortar, through the covered opening as shown, and is secured in place by a dovetailed key at each end, thus permitting it to be adjusted to the varying height of the dies and relatively to the discharge. When the mortar is used for wet crushing, to be followed by concentration without amalgamation, the chuck-block and coppers are omitted. The outward inclination of the screen increases its capacity and prevents the openings in the screen from becoming clogged by wood fiber, of which there is more or less in nearly all ores. The cuts on the front page of this issue are self-explanatory. The plant illustrated was built by the Edward P. Allis Co.

Miners vs. Agricultural Claims.

TO THE EDITOR:—On a recent trip to the mountains I visited several mining properties, some of which were in litigation with "agriculturists," and one of which belonged to the latter. Never before have I been so impressed with the unscrupulousness of a certain class of men, who seem ready to put their consciences into their pockets and swear to anything as now. In one instance a valuable mining property was being and had been worked to a profitable outcome, and yet it was claimed as agricultural land by another.

Between the railroad and the agriculturist the miner has had a very unjust deal, and it is about time the miners of every county combined to protect their interests, by forming a special fund for sending to San Quentin every perjurer who treads upon their rights. A few men put behind the bars would end this outrage on the miner.

As the California Miners' Association is to hold its yearly convention on the 19th of next month, I suggest that miners, who have a just case of perjury, present all the facts of their cases to the convention, and thus bring forth some more decided attention for the protection of miners than has been had of later years. Of course, we all know this kind of work has been going on for years, more or less, and been "winked at." And now that mining has more value to it than the agricultural idea has, the "agriculturalist" is turning his lands into profitable mining ventures.

It is a possible thing for any miner who can find a good unlocated claim on "agricultural" land, even though patented, to locate and hold it, from the simple fact that the "mineral" is unpatentable, except as such, and that perjury conveys no rights. Mining is now coming to the front, and the prospector will have more protection in the future than in the past.

ALMARIN B. PAUL.

San Francisco, Oct. 3, 1894.

Scientific Progress.

LAST WEEK reference was made to Prof. Dewar's successful experiments in producing intense cold. It was then stated that he had not yet succeeded in liquefying hydrogen, but expected to. Since then experiments lead to the helief that he has converted hydrogen gas, the lightest substance known, into a liquid, and produced a temperature of 240° below zero, Centigrade.

The theoretical hasis of all these experiments is the fact that a volatile suhstance, when evaporating, will produce on the surface of the vessel containing it a temperature which is lower than that of the surrounding air. This effect may he heightened if the fluid first be put uuder enormous pressure hy mechanical means, and also hy having the evaporation occur in a receiver from which as much air as possible has been exhausted. Thus, with liquid nitrous oxide, liherated under those conditions hetween the outer and inner walls of a douhle receptacle, Dewar got —90 C., and reduced to that temperature a more volatile fluid, ethylene, contained in the iuner chamher. The ethylene had also heen put under pressure before heing set free, and gave —145 on evaporation. Compressed oxygen, hrought to that temperature hy the ethylene, produced —210 when liherated.

There, for a time, Dewar thought he was effectually halked. It is not necessary, in order to change a substance from the gaseous to the liquid state, to reduce its temperature to what is known as its hoiling point. If it he suhjected to great pressure, it will liquefy at a higher degree. It must, however, he reduced helow what is called its "critical point." Thus, liquid oxygen boils at —184 C. But its "critical point" is —115 C. Natterer suhjected this gas to a pressure of thirty tons to the square inch; but as he used a temperature ahove —115, his efforts failed. Dewar, on the other hand, not only employed enormous pressure, hut cooled his oxygen helow its critical point. Hence he was able to convert it into a liquid at —145. Now the critical point of hydrogen is —210. The utmost skill of the great experimenter would enahle him harely to reach that stage, hut not go a single degree further. His victory was finally achieved hy making a new substance, a mixture of air and hydrogen, whose critical point was about —200. The old tactics thus became practicahle. His product was sometimes a sort of paste or jelly, and sometimes a white solid with a clear liquid so volatile that he could not capture it. Both theoretical reasons and thermo-electric apparatus enable him to say that it had a temperature of ahout 240° helow zero C. He does not feel disposed positively to pronounce the liquid to he hydrogen, pure aud simple; but he is unahle to say what else it is, and evidently believes it to he that gas iu a new form.

The difficulty which he has in collecting the fluid, owing to its volatility, is not his only embarrassment just at present. These experiments are very costly, and it is intimated that he needs pecuniary help in prosecuting them further. Of the liquid air which he is able to produce, two-thirds evaporates in the handling. But of the liquid hydrogen he gets only from one to five per cent. In other words, it is ahout twenty times as expensive.

This matter hecomes intensely interesting when one remembers that the "ahsolute zero" of the scientists, the degree of cold heyond which it is estimated it is not possihle to go, is only —274 C. (—461 Fahr.). Dewar has almost reached that point already. It is natural to believe that if any one ever gets there within a few years he (or perhaps Pictet of Geneva) is the man to do it. Moreover, if either of these chemists or any one else ever succeeds in completely isolating liquefied hydrogen from other substances, and in keeping it at a temperature of —230 or —240 for a short time, it ought to he possible, by using it in the same manner as nitrous oxide, ethylene, oxygen and hydrogen have been used, to produce still more extreme cold. Hydrogen is the lightest and most volatile substance known. Hence it is the very last resource left, apparently. In his other attempts Dewar has gone down fifty or sixty degrees at a time. Where will the final one land him?

The Big Telescopes.

The glasses of Mount Hamilton, Milan and Pultowa reveal worlds at the present time in all stages of evolution. They may he traced from misty nehulæ to glitteriug suns, from orhs in the high noon of development to those that repose in the sepulchral shadows of the coming night. But, says the Pittsburg *Dispatch*, neither hy analysis or analogy can we conclude that the activity of the universe hegan only when man hegan to evolve on the inconsequent and dimiuutive sphere kuown as the earth. We may not conclude that the myriads of scintillant suns in space—the 500,000,000 of orhs that the great Lick telescope disclosed in the milky way alone—are only celestial lanterns hung out to illuminate terrestrial night. A wider knowledge sustains the conclusion that other worlds long preceded ours and shall long continue when the fretted fahric that we call our glohe shall have passed away. We may, then, dismiss some of our early conceptions and grasp the fact that terrestrial creation, instead of ranking as the event in the economy of the universe was only one in an eternal train of minor incidents. What else may he the meaning of that illimitahle and infiuite field of space where glows diffusiug light and heat, the countless hosts of colossal suns, which, we are compelled to acknowledge, must radiate their light and heat, and must diffuse these into systems that must evoke them.

And wheu the great Chicago telescope is completed, when we may explore the added area and possess the added iutensity and the stellar revelations come nearer to us, and when, heyond that telescopic achievemeut, come others in the coming century with still farther and keener sight, we may he ahle to grasp hut a littlc of the great significance that may he unfolded.

The world is yet young in stellar science. It is not old in any kind of science. It is ouly in the dawn of the significance of knowledge and of making its practical application. We are hefore the sunrise; only in the twilight, and just hehind us is the night. We are still so near our congeneric savagery that the harharous imprint confronts us everywhere; the civilizing telescope, even with ourselves, is almost as nothing to the interest hestowed on some new death-dealing device, and our greatest honors we hestow on those who are most conspicuous in the destruction of their fellows.

AN ENGINEERING JOURNAL, in discussing various popular misconceptions of scientific phenomena, refers to the frequency with which it is stated that large amouuts of valuahle fuel are poured into the air in the form of smoke from the chimneys of factories and the funnels of steamers. Such statements are now declared to he almost entirely without foundation, and it is held that no appreciable economy is likely to he effected hy smoke-consuming devices and that mauufacturers should demand hefore adopting them much more convincing and sounder reasons than those usually given. The analyses of a series of furnace gases made by a committee of the English Institute of Mechanical Engineers showed ahsolutely no carhonic oxide in any one of the eighteen samples taken from each funnel. The city analyst of Glasgow, Scotland, maintains as the result of analysis that in all ordinary coal the heating power of the whole of the hydrocarbons is only a small proportion of the total, and hence, even if the whole of these escaped combustion entirely, the loss would not he so serious as it is commonly stated to he. Even soot contains only about sixty per cent of combustihle material, and samples collected from heavy smoke showed only 51.46 grains of soot per 100 cubic feet of furnace gases. The soot consisted largely of mineral or incombustible matter. Careful experiments show that the solid comhustible matter of the smoke can only account for the very small percentage of 0.71 of the total heating power which can he ohtained from the coal. The conclusion reached is that the real waste in smoke is very small indeed, and the popular helief in immense loss from this cause is simply a fallacy and is decidedly not corrohorated hy experiment.

HEALD'S
Business College,
24 Post Street, - San Francisco
FOR SEVENTY-FIVE DOLLARS
This College instructe in Shorthand, Type-Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our echool hae its graduates in every part of the State. Send for Circular. C. S. HALEY, Sec.

THE JONES ROCK DRILL
IS THE
Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durahle, reliahle, simple, compact, light, easily handled and operated hy one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should he in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

DEWEY & CO., 220 Market St., SAN FRANCISCO,
PATENT SOLICITORS.
ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have ahle and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far heyond those which can he offered home inventors hy other agencies. The information accumulated through long and careful practice hefore the Office, and the frequent examination of patents already granted, for the purpose of determining the patentahility of inventions hrought hefore us, enahles us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Mechanical Progress.

Chimney Draft.

It is generally supposed that the draft of chimneys is due solely, or almost so, to the expanding of the enclosed heated air in the chimney, thereby giving it a buoyant or ascensional power, which is known as draft. But unfortuuately for this theory we find a decided draft in chimneys without heat or fire passing through them.

The fact is as to drafts, like electricity, we know very little as to cause and effect, independent of the fact that all the technical journals are profuse in formulæ to show the amount of work produced by electricity and draft respectively. Should one ask an engineer versed in electricity or draft from the mechanical standpoint, what produces the phenomena, if he is candid he will frankly admit he does not know.

A gentleman of high standing in electrical engineering, when I asked him to define electricity, replied that he did not know, but it was produced in one way by revolving at a high velocity a coil of wire in space, and combing, as it were, the electricity from the surrounding atmosphere. Rather a romantic answer, but one which, in a way, defines the operation.

As to draft in chimneys, although applied in the arts for over 1800 years, yet no one can say with certainty how it is produced.

If any one will look over the transactions of the mechanical engineering societies and read the discussions on chimney draft they will be surprised at the differences of opinion expressed by the learned men who have discussed the subject. But there is one fact as to which there can be no doubt, namely, to produce a good draft in any chimney the height of the chimney is an essential factor for the economic combustion of fuel.

The draft power of chimneys is dependent on their area of cross-section and height, other things being equal. The ordinary tables and formulæ for dimensions of chimneys for various horse powers of boilers is based on the following assumed or asserted data:

First—The draft power varies as the square root of the height.

Second—The power varies directly as the area of the shaft.

Boiler makers as a rule assume the above to be correct. Now as to the facts in practice: The draft power based on the above, and the tables deduced therefrom, a chimney 48 inches in diameter and 150 feet high, would be only sufficient for 425-horse power boilers, whereas the writer has actually produced 1000-horse power (based on 30 pounds of water evaporation) by a chimney of the above dimeusious, and purposes to add a 200-horse power boiler as soon as may be required.

I cite the above to show the fallacy of all the formulæ as to draft power of chimneys. It is assumed, according to the above rule, that their height should be eight times the area of the chimney. The quality or kind of fuel is not stated.

The important factor, grate surface, depends on the different kinds of fuel used, and the conditions under which the fuel is burned; again, the tables are also based on a temperature in the chimney of 600 degrees. A very high temperature, it would seem, having in view proper economy. The intensity or degree of heat evolved by the fuel varies in proportion to the rate at which it burns; the greater the draft is, the greater the amount of work will be produced from the same fuel. The power of draft is directly proportional to the height of the chimney, and the velocity with which the external air flows in to supply the draft depends upon the temperature of the asceuding gases. The higher the temperature is, the lighter will be the gases, which consequently will produce a stronger draft.

That there is draft in a chimney without fire no one will deny. In a great many chimueys the infiltratiou of air through the masoury has, no doubt, a great influence to retard the velocity of the heated gases when in use. The intensity of draft is independent of the area, and depends upon the differeuce between the inside aud outside temperature. The degrees of heat produced by the fuel varies in proportion to the rate at which it burns; the greater the draft is, the greater amount of work that will be produced from the same fuel. This goes to show the importance of tall chimneys; therefore the power of draft is directly proportional to the height of the chimney, and the velocity with which the external air flows in to supply the draft depends upon the temperature of the ascending gases.

Air at 520 degrees temperature expands to double its volume at 32 degrees; therefore, the higher the temperature is the lighter will be the gases, which, consequently, will create a stronger draft.

A rapid draft is, in one respect, equivalent to a large fire-grate area, since it enables more fuel to be burned in a given time, and thus increases the power of the boiler in generating steam. A rapid draft, however, has this advantage, that, inasmuch as the temperature of the furnace is higher when the same quautity of heat is generated in a small space than it will be when generated in a large space, the heat is trausmitted much more rapidly to the water in the boiler in the case of the strong draft, by reason of the higher temperature thus obtained. The maufacturing requirements of modern times demand the building of high chimneys, so as to enable more fuel to be burned in a given space of time, and thus increase the power of the boiler.—W. Barnet Le Van.

Pipe Bending.

Small iron pipes, up to one inch in diameter, may be bent cold and even coiled by wiuding them around a mandrel in a lathe, provided the diameter of the coil is at least nine or ten times the diameter of the pipe to be bent. Short bends in iron, brass and lead pipe are apt to flatten at the bend. This is frequently prevented by filling the pipe with lead, which must be melted out after the bending has been completed.

A set of "bending coils" can be easily made by any machinist for use when occasion demands. A separate coil is ueeded for each size of pipe to be operated upon. Steel wire is wound into a coil which will slide easily inside of the pipe to be bent. One end of the coil should be tapered to allow it to enter the pipe easily. The other end ought to be fitted with an eye turned in the end of the wire. Into this eye a cord or chain must be fasteued so the coil may be pulled out of the pipe after bending.

The pulling out of the coil does not require as much power, after the bending, as would be supposed, because the pulling of the coil lengthwise causes a decrease in diameter of the coil, which permits it to be drawn easily out of the bent pipe. Wire one-eighth of an inch in diameter should be used for a bending coil for a pipe one inch in diameter; for one and one-half inch pipes, one-quarter inch should be used.

A COLLIERY SHAFT was sunk recently at the House colliery in Belgium in an interesting manner by the Pœtsch process, which has been employed once or twice in this country for similar work. A number of metal pipes were first sunk outside the limits of the proposed shaft to a depth lower than a stratum of water-bearing sand nearly 40 feet thick, which occurred at a depth of about 200 feet. These tubes were quite large and closed at the ends, and inside them were placed others open at the ends, so that the interior of each main tube was divided into two chambers. A very cold solutiou of chloride of magnesium was then forced down the smaller tubes, and rising outside them in the larger ones it gradually froze the water in the quicksand until it became hard enough to be worked like rock, so that a shaft could be sunk through it. The water flowing through the quicksand when work began amounted to over 4000 gallons an hour, and to freeze it required eighteen of the double sets of tubes, which were sunk on the circumference of a circle about eighteen feet in diameter.

IT HAVING BEEN FOUND that water meters, like gas meters, sometimes register more than the actual consumption, investigations were made at Mannheim, Germany, which showed that an air sack in the house pipes would produce this effect. It is therefore recommended that apparatus, consisting of an air chamber and clock valve, be placed just inside the meter to take up vibrations due to bad plumbing.

MR. MAXIM'S FLYING MACHINE, which was injured by an accident last July, has been repaired. He now offers to build a machine for crossing the English channel within a year if $250,000 is furnished him for that purpose. This would be the culminating test should it succeed, and a leading British periodical—*Industries and Iron*—thinks that the money would be well spent.

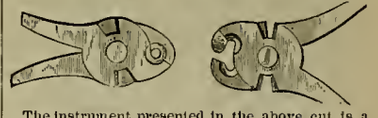
Hyposulphite of Soda,
Sulphide of Iron,
And Other Chemicals.

GIANT POWDER FURE CAP FASTENER.


The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.
MOONEY & SHERWOOD Fresno, Cal.

Practical Hydraulics.
A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators.
BY P. M. RANDALL.
This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.
TABLE OF CONTENTS.
The following brief abstract of the contents will give an idea of the branches of the subject treated: General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water Through Openings; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.
Price, $2.00, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MINING ITEMS—AMADOR GOLD MINE.—*Republican:* The argument in the case of Vincent Neale vs. the Amador gold mine was heard before Judge Davis in San Francisco on September 5th. The case was argued in San Francisco for the convenience of the lawyers. Vincent Neale argued for the plaintiff and Mr. Eikoff for the defendant. The matter is now submitted to the court for its decision. The point in contention is the right of possession of the Amador gold mine. The suit does not involve the title beyond the mere right of possession. Plaintiff claims possessiou by virtue of a sheriff's deed under foreclosure sale. While holding tbis deed the defendant corporation, by its agent, took forcible possession and has held possession ever since. Plaiutiff therefore sues to gain possession under the forcible entry and detainer provisions of the code. We are informed that in the event of the plaiutiff gaining possession, the Euglish company will at once proceed to operate the Amador Queen property, which has been consolidated with tbe Amador gold mine under the English incorporation. There are two suits pending in the United States courts regarding the title to the Amador gold mine, but as far as the Amador Queen is concerned, we believe the title to that property is not in litigation.

LUCILLE.—The mill ou this mine, formerly known as the New London, is being pushed ahead rapidly. Mr. White of San Francisco has charge of its construction. He is the same party that built the mill of the Amador gold mine. The contract calls for a forty-stamp mill. Much of the frame work of the old mill erected for Ballard and Martin will be used. A small force of carpenters is at work at present. A representative of the Joshua Hendy Machine Company is on the ground in the interest of his firm, that company having the contract for furnishing the iron work for the mill. The water for power will be taken from the Hayward ditch.

MISCELLANEOUS.—The Gover mine is still in the hands of the sheriff. The prospect of its startiug up under the arrangement recently made between the company and its creditors is not bright. Robert Doble, the secretary, was in Jackson the past week to effect some change in the agreement so as to secure any money that may be advanced to put the mine iu working order, by a first mortgage upon the property. This the attaching creditors do not seem willing to do, and so the matter stands at present. The supply of fuel at the mine is not more than sufficient to run another week, and when that is exhausted somebody must furnish wood to keep the engine going, otherwise the long-deferred calamity—the flooding of the mine—will overtake the property.

The sheriff's force employed to keep the mine free of water was withdrawn lately, and the court allowed tbe wages of keepers, engineers, etc., and authorized the sheriff to pay the same out of the money in his hands, realized from the cleanups of the mill. The water is being kept out at present hy the Keystone Company, who undertake for a few days to keep the mine from filliug up.

Mariposa.

AN AWAKENING.—*Express:* The English syndicates who are operating in the Mariposa mining fields understand the full value of electric power. They are takiug a lively interest in the proposed Yosemite Valley railroad for two reasons, the most weighty of which is the prospective decreased cost in milling their ore. The item of transportation is not to be sneezed at, and, being men of ideas and experience, they are not slow to appreciate that fact. Several of the syndicate are now negotiating with the projectors of the proposed railway, and with the completion of the latter project, the mining regions of Mariposa, already feeling the effect of recent developments, will become one of the most celebrated coin producing sections in the United States. The good results flowing into Merced as the logical outcome are incalculable. The population of both counties would double in a couple of years with the possession of such advantages.

Nevada.

Transcript: A quartz ledge of good size and remarkable richness was struck a few days ago in the West Harmony drift gravel mine. Free gold can be plainly seen iu much of the quartz, and some of the pieces are literally filled with the precious metal. There are two good ledges in this mine, but as the company are operating for gravel the quartz will not be worked until some time in the future.

Cor. *Herald:* Reports from all the working mines in the vicinity are very favorable, and the outlook for the coming spring is unusually hright for both Washingtou and Eureka towuships. Messrs. Hippert and Foley are putting up a mill on their ledge near Graniteville. The Rainbow mine now has a force of abont twenty-five or thirty men at work. The California has let a contract for 1,500 feet of tunnel and has a number of men taking out ore. The Mountaiu View mine, on Canyon creek, has been increasing its force of employes. The Culbertson mine, in Eureka district, still continues to do well. Iu the spring a large mill will be erected at the Spanish mine below where the present mill stands. This miue is well opened and developed so that it can now be run at a great reductiou iu expense, eveu below the remarkhly low cost on which it has been conducted heretofore. We hear that the Oak Tree mine will have a working force of about fifty men during the coming winter. The Blue Jay continues to look as favorable as ever. Mr. C. G. Fisk & Son, who have returned to the town for the winter, report very encouraging prospects at their gravel mine on Fall creek, and Mr. James Blaine, who has charge of the mine adjoining Messrs. Fisk & Son's, reports likewise. The last named property is owned by Messrs. B Murphy, Jr., & Co. The Fall creek country is a section of our county that has been greatly neglected by mining men, though it has in the past yielded an immense amount of gold to local prospectors.

Riverside.

Gazette: William R. Hearst, of the San Francisco *Examiner*, and J. M. Wilson, a San Francisco capitalist, have taken a working bond of ninety days, with a generous forfeit, upon the Arica group of gold mines in Riverside county, California, located thirty-five miles west of Ehrenburg on the Colorado.

The owners of the claims are Hiller & Gray, Phœnix, J. E. Teeters of this city being also interested with Mr. Gray in one of the claims. The purchace priee, which is to be paid if the mines are accepted, is $175,000, of which $125,000 is to go to Hiller & Gray and $50,000 to Gray & Teeters.

The capitalist investors have placed a large force of miners at work and by the expiration of the bonding time will have thoroughly tested the properties.

Gold is the metal that is to be found in the Arica claims, and there is said to be a fabulous amount of it in the ore so far developed. Something like 500 feet of development work has been done, and throughout free gold ore has been exposed in a broad and well defined lode. Experts who have examiued the property declare it one of the greatest mines in the West, and though the price to be paid is a big one, the general impression heretofore has been that an even million would be none too much.

Col. Gray is exceptionally fortunate in securing good mines. He was one of the first owners of the famous Harqua Hala mines and was a party to the sale to Hubbard & Bowers for about $50,000, a sum ridiculously smaller than the value of the properties, which afterward were sold for three-quarters of a million. It is believed that the Arica claims are fully as good as the Harqua Halas, with even a stronger ore body, and before long its output may be depressing the market price of gold bullion.

Sierra.

RICH DEVELOPMENT.—*National-Bulletin:* The Bull of the Woods is situated near Haskel's Peak, iu Sierra county, and about three and a half miles southeast of Gold Lake, at an altitude of about 7900 feet. Major Mason, J. C. Knickrem, N. Frayer and two other gentlemen each own a one-fourth interest in the property. Recently a shaft was put down forty feet beside the vein and a cross-cut into ore made. The ledge is estimated to be thirty feet wide. Previously Major Mason had ruu a tunnel 136 feet lower than the shaft to tap the lode. This was driven in 600 feet and to within 115 feet of the shaft. The body of ore is said to be immense and is considered to be on the "mother lode" of that country, of which the Young American mine forms a part. About two feet of the vein next to the hangiug wall is a very peculiar ore, embracing galena and copper-silver glance. The owners think it fabulously rich and confideutly assert that it will produce from $50 to $60 per ton.

On Monday, Messrs. Frayer and Knickrem purchased the Huntington mill at the Bushman mine near Quincy and are moviug to the "Bull of the Woods." They will push work on it, and they expect to have it in operatiou in about three weeks. The property is only a few miles south of Mobawk Valley and a short distance across the liue, in Sierra county.

Trinity.

TRINITY CENTER MINES.—*Journal:* J. C. Strode is running his mill steadily on his quartz ledges on Hostetter gulch and is makiug large cleanups monthly. This is probably the most valuable quartz mine in the county that is now being worked. He is working ten men at the mine. In the spriug he will put up reduction works and otber improvements and will have a finely equipped plant.

At the Altoona quicksilver mine in the Cinnabar district, work is progressing rapidly and satisfactorily. All the machinery is on the ground and the furnaces are about half finished. All improvements put up by tbe company are of substantial nature, and are so located that the free working of the mine can never be interfered with. At present all the help that can be used to advantage is being worked. About fifty men are employed in the mine and forty men in the woods getting out timber, etc. One thousand cords of wood have been stored for use and a contract for 300,000 feet of lumber has been filled for the company. The plant will be ready for operation in abont six weeks. In this miue tbere are three paying ore bodies, two of which were found this summer in doing development work. The ore is of very high grade and yields a large per eent of quicksilver. All work done on the Altoona mines this summer has been under the efficient direction and management of Superintendent J. F. Cox. This property is undoubtedly the most valuable of any quicksilver property in the State, and as soon as operations are conducted on a large scale will make a name for itself not confined to Trinity county.

One of the most promising strikes made in the northern part of the county, or in any part of the county this summer, was made last month on Cedar Creek mountain, at the head of Cedar creek, distant from Trinity Center about nine miles. The discovery was made by G. Doty, a prospector in partnership with William Vollmers, and consists of two locations, to which the name of Mountain King has been giveu. The name is an apt one. The ledge has beeu uncovered by three crosscuts 200 feet apart, and shows up an average width of twenty-five feet. Throughout its entire width the ledge prospects in free gold, in some places assaying as high as $40 to the ton. The average grade of the rock is from $8 to $10 to the ton. The owners are running trails and have put up a cabin on the property. A tunnel has also been started to run on the ledge. The mine is favorably situated for workiug, plenty of wood and water being easily accessible. From present indications, this will develop into one of the best properties in the county.

Near the above location McKenzie & Shoemaker have a location which looks promising. They are engaged in running a tunnel on their ledge, which is four feet wide and the ore is of a good milling character.

Mather & Maitland, who have charge of the Nash gravel mine, have twelve men at work getting the claim into shape for next season's work.

NEVADA.

ESMERALDA'S NEW CAMP.—A correspondent of the Dayton *Times* says:

Six months have made a most decided change in the aspect of Silver Star mining district. Then but a few prospectors could be seen scratching around on the surface; now houses, cabins and tents are thickly strewn in the canyons and on the hillsides, and all is bustle. A visit to Douglas reminds an old Californian of the early days of that State. Everything seems to be in common, the property of one being free to all.

Ore is being extracted from about twenty different mines.

The five-stamp mill in course of construction by Douglas & Co. will be completed and in running order by the 17th inst. Its present capacity will be about ten tons per day of twenty-four hours. The ore will be amalgamated in the battery and run over copper plates. The ore being free, it is believed that there will be no necessity for the use of pans, but should tbe same be required it will be an easy matter to put them in. Water is carried to the mill through pipes from a spring 2000 feet distant.

An election precinct has been established here, and sixty voters have been registered up to the present time.

KENNEDY NOTES.—*New Era:* The Imperial mill is uow continuously dropping twenty stamps and reducing over sixty tons of ore every twenty-four hours.

At the bottom of the winze in No. 3 tunnel of the Imperial is an eight foot vein formation containing two feet of $50 to $60 ore.

The concentrators at the Jenkins mill will be in position the first of the coming week, and soon thereafter the mill will be in runniug order.

If a smelter is constructed in Kennedy, the town will gain importance and population by rapid strides and be the foremost mining camp of the West. With the Imperial mill reducing seventy to eighty tons of ore daily, the smelter 100 tons daily, and the Jenkins mill in operation, Kennedy will indeed be a lively place.

Four pyritic smelters are now in operation, and would be more, but for the lack of fields of the right kind of ore. The ore must contain a certain percentage of sulphur and iron, and be capable of fluxing itself as in the ordinary furnace. In Keunedy the conditions are perfect, and no doubt that before long there will be one of these smelters running at full blast in our camp.

Mr. Austin has been in communication with Manager Wardner for many months and has made tests of samples of Imperial sulphuret ore sent to Denver, resulting in a dispatch being received Tuesday to the effect that he would leave Denver on Thursday for Kennedy, prepared to complete arrangements for building a $60,000 pyritic smelter in Kennedy.

The mines in the basin west of town will compare favorably in richness of ore with any on the coast. Wiggins & Wilson are taking out carloads of rock running as high as $500 a ton in free gold. The Shamrock company has a four foot vein of rich ore in the Blacksmith tunnel, and in the lower tunnel is a fourteen foot vein of ore averagiug $18.50 in gold with no silver. The Pride of the Mountain has two to four feet of ledge giving $20 to $100 in free gold per ton. A number of other good claims might be mentioued.

COLORADO.

SAN FRANCISCO MEN INVEST.—*Republican:* The two claims of the Extension Gold Mining and Milling Company, two and a half miles north of Breckenridge, Summit county, have been sold to San Francisco mining men for $100,000, the last payment to be made within sixty days. The company was organized in March, 1892, by Henry M. and George W. Fair, the original locators, who owned the majority of the stock when the deal was closed.

The extension is ou the same vein as the Jesse, which cleaned up $75 ounces last month. The development consists of tunnels and shafts that have exposed over $200,000 worth of ore. With only a ten-stamp mill the cleanup for the first half of September was 125 ounces. It is proposed to increase the capacity of the mill to 50 tons a day, and to make the mine one of the largest producers of the county. The vein is well defiued and extends the full length of the two claims of the company, or 2840 feet. Up to date, it has opened for 300 feet, disclosing a strong and permanent fissure.

SIXTY-FOUR PRODUCERS.—The Durango *Southwest* estimates that there are sixty-four mines and prospects on the Junction slope, most of which have shipped pay ore after paying $20 smelting charges at Durango. A number of these properties are in Oro Fino camp and the ores are decidedly free milling, which meaus plates and tables. A large per cent of the high grade paying properties of La Plata are found in Wall's Gulch, Ruby, and Hefferman, the Junctiou creek slope from Lewis mountain. The sectiou embraces a belt fully six miles long and two miles wide. The veins are large vertical fissures, with a phorphyretic quartz, and spar gangue, the pay streaks varying from six inches to twenty feet. The gold is native aud tellurium. The first grades ruu from $100 to $500 by sorting. The lower grades, below $50, ore remain on the dump, awaiting the advent of cyanide or some other treatment cheaper than smeltiug at $20 per ton.

IDAHO.

THE CLAYTON SMELTER.—The Clayton Mining & Smelting Company started their smelter at Clayton, Ida., last week, for a run of sixty days. The smelter laid idle for a year, and that district was left in a bad shape, with but few men working in the mines. Superintendent Greene, however, put a few men in the mines belonging to the company, and enough ore was taken out to make a short run, and he decided to iuerease the force so as to occupy as much of this fall as possible in smelting. About 2,000 tons of ore is available, and it will be put through. This will require a run of about sixty days. So far about thirty men have been employed the past four months, which with the two months to come and the employment of a full force of men to operate the smelter, the employment of men and teams to produce and deliver charcoal, limestone, etc., will put the citizeus of the district in good shape for winter, so that these operations mean much for the people of Custer county. The mines belonging to this company are in excellent condition, so that if silver should be restored to something near its former value, the district would soon become lively, like it was a few years ago. As it now is, the chief object of the company in makiug a run this fall was to give their old employes an opportunity to earn enough to make it possible for them to remain in the country without suffering for the necessities of life.

MAY USE THE RUSSELL PROCESS.—Boise *Statesman:* The owners of the Golden Star mine have discarded tbeir Crawford mill, and they are talking of treating their ores by the Russell process. A quantity of the ore recently shipped to the Ontario mine, Utah, and subjected to tbat process, gave very satisfactory results.

OREGON.

BAKER COUNTY.—*Democrat:* A one-fourth interest in the Brazos mine has been sold by Thos. Heady for $5000 to Clark Suide.

Messrs. W. O. Reynolds and Thomas Gorman have received $3000, the balance due them on the sale of their Columbian mine to Chicago people. This pays them iu full for the property—$6000 in all. The purchasers will now continue their arrangements for erecting a mill and puttiug the mine in shape as a producer.

MONTANA.

GRANITE COUNTY.—A writer in the Philipsburg *Mail*, in speaking of the promising gold properties at the head of Gold creek, in Granite county, says: Sullivan & Burrier have a group of six claims, the only extensively developed one being the El Dorado. Their assays range between $5 and $150 per ton, gold, and only one or two ounces silver. A very valuable feature of their ore is especially after the recent experience of the Royal Gold Company, whose 200 tons of concentrates yielded $20,000—the adaptability of its sulphurets for concentration, but the bulk of it is free milling.

Inter-Mountain: The principal event in mining circles during the week was the bonding of the Poulin to Silas F. King for $127,500. It is understood that Mr. King is being backed by a rich syndicate and that operations will shorly be commenced on a large scale.

Reports from Whitehall are to the effect that a genuine miniug boom is on in that locality. The framework of the 150-ton concentrator of the Golden Sunlight group is up and ready to be housed in. The boiler and engine are on the ground and everything is ready for the placing of the machinery in position. About eighty men are employed at both ends of the tunnel. The air is said to be bad and slow progress is being made, but when the tunnel is connected there will be no trouble on this account. A tramway will be erected to transport the ore from the mine to the smelter.

NEW MEXICO.

"WITHOUT THE AID OF COURTS."—The Cochiti gold field is disputed territory, and the case is now iu the courts. At a recent meeting of miners there these resolutions were adopted:

WHEREAS, A rumor has been current that tbere are parties contemplating jumping claims that have been regularly located according to the United States and territorial laws, in case the land courts decide agaiust the land claimants; therefore, be it

Resolved, By the members and prospectors of the Cochiti mining district, in meeting assembled, that they do hereby warn such persons that any act of this kind will not be tolerated, and such persons will be punished without the aid of the courts; and be it further

Resolved, That this shall apply to the claims of all persons, whether present or absent, if they have been regularly located.

Bland, N. M., September 28, 1894.

SOUTH DAKOTA.

Pioneer: Captain St. John, of Bear Gulch, was a visitor in Deadwood yesterday. He only visits the city once in a while, and is a man thoroughly posted on all Bear Gulch and neighboring mining counties. Placer mining has been very successful this last summer; the gold produced has paid very good wages. The shutting down of the mines in Terraville and Central caused an influx of people hunting placer mines, and Bear Gulch got its quota of the willing workers. The tin claims in that country have been worked this summer and several good veins have been uncovered which will pay from 1¼ to 2½ per ceut of tin, while lots of sample pieces run from 25 to 50 per eent. Letters are received daily from parties all over the United States, asking about the tin in that country. The Harney Peak Tin Mining Company have advertised this industry of the Hills and Bear Gulch miues have come to the front since the closiug down of that camp. China and Japau are uow using tinware for everything, the cheapness

being its best recommendation, and it will not be long until the mines in the Bear Gulch country are rivaling the gold mines of Yellow creek.

UTAH.

GENERAL NOTES.—*Tribune:* The Bullion-Beck Company has begun to construct the plans for a 200 ton concentrator which is to be put up at once at Eureka. The site has been selected and the contracts let for some of the machinery. The new mill will treat ores after the manner of the big Lead mill at Bingham. The company expects before very long to have its own smelter, as well as concentrator.

The new West Mountain placer mine will be in active operation, with mammoth pumps going, next week. The first pump is now down about ninety feet, and a shaft is being sunk at the rate of fifteen feet a day for the second one. Bedrock will probably be reached within 150 feet.

Down in the Gold Mountain country the Sevier Mining & Milling Company has mastered the water problem and is in a fair way toward turning out some rich ore very soon. A ten ton concentrator is in operation.

The presence of some rich ore is reported from the reservation country.

The Ibex Company is progressing rapidly with the construction of a 100-ton smelter at Leamington. Final completion, however, as also the renewal of shipments from the Ibex mines, will wait upon the extension of a small spur of the Union Pacific Railroad.

New smelters and mills seem to be the order of the week. Besides the Bullion-Beck and Leamington is a 150-ton plant being erected in the Geyser group. A mill with that capacity has recently been transferred from Bingham by the Geyser Company and is now in course of erection at Mercur.

The Centennial-Eureka, which declared a double dividend last week, is about to put in a mammoth air compressor, and only awaits the arrival of the machinery to finish with the work. It is expected to arrive early next week.

In addition to the several definite things mentioned, there are a number of mining schemes of some magnitude afloat, which may not appear in print for some time, but which are of great importance to the Territory and to the mining interests.

BULLION-BECK'S BIG PLANT.—The test of the Lead mill at Bingham has proved so satisfactory to the directors of the Bullion-Beck mine that they have determined to proceed at once with the construction of a mill for the similar treatment of ores at their mine. Yesterday evening Messrs. Beck, Ryan, Cunningham, Knox and Bamberger proceeded to the mine to oversee the inauguration of the work on the plant. They took with them Mr. L. C. Trent, the mining machinery dealer, and a Mr. Kirby, who has been foreman at the Jordan mill at Bingham and who conducted the test on the Bullion-Beck ores. Mr. Kirby is to be made foreman of the new mill.

The Bingham mill will be much enlarged upon in the plant at Eureka. In place of the fifty-ton capacity a 200-ton concentrator will be erected. Owing to the greater hardness of the Bullion-Beck ore the machinery has to be much heavier and more powerful than in the Bingham mill. Of course the construction of new housing will be necessary, together with many other incidentals and accessories. The company announced yesterday that it would erect a new lathe, and install an entire machine shop equipment, the outlay necessary for which will be quite heavy.

Another feature of the new work will be the use of patent framers for all the timbers.

Altogether, the improvements will tend to increase the output of the mine considerably, and to enable the company to profitably treat thousands of tons of ore that has heretofore been thrown away.

MERCUR DISTRICT.—The opening up of the Big Sunshine mine is verifying all anticipations. The sinking of the shaft to determine the width of the vein shows sixty feet of ore. The grade is not high, but it is rich enough to promise big returns. Report is to the effect that a mill will be erected at the mine as soon as the development work is completed.

BRITISH COLUMBIA.

MINES OF THE SLOCAN.—Byron N. White, general manager of the Slocan Star mine, reports the Nakusp & Slocan railroad completed to Three Forks. "The Slocan country is the most prosperous section of the entire northwest, in my opinion," said he. "The output of the mines this winter will be more than double the entire output of the country up to date. The Grady group, on Four Mile creek, is shipping forty tons of ore a day to the railroad at Wilson creek by steamer from Silverton. This ore goes to Omaha via the C. P. R. It is reported to run about 125 ounces of silver to the ton and about seventy per cent lead. The Fisher Maiden is also getting ready to ship a lot of high grade dry ore.

"The people of Three Forks are building a wagon road to the Idaho basin. This will serve the Idaho, Alamo, St. John, Cumberland, Democrat, Young Dominion, Queen Bess and many other mines. The output of this one basin this winter should not be less than 3000 tons. We have 850 tons of ore from the Slocan Star at Three Forks now, and we will begin shipping from the mine again as soon as snow falls. Our output will be 1000 tons or more this winter. On the Noble Four group they are mining and sacking ore now, and will probably ship 2000 tons. The Deadman is being opened up and will make big shipments, as will the Reco, which should be good for 1000 tons or so. The Bluebird has been worked all summer and will have from 500 to 700 tons to ship. S. S. Barley has put up new cabins at the Payne and will ship from 300 to 500 tons. The Idaho No. 2 and Danderberg will make good-sized shipments like their neighbors. The McDonald Bros. are in shape to ship 500 to 700 tons, and the Dardanelles and other big mines in that vicinity will be big producers, but their ore will probably go by Kalso. There are plenty of men in the country and I advise none to go there in search of work."

NELSON.—*Miner:* At Forty Nine Creek the Nelson Hydraulic Mining Co. has struck it rich. The company has been steadily going on piping although the water supply was not quite what it might have been. In the course of their work at the end of the last week a bank of hard cement gravel was uncovered, which on being tested has given excellent results.

Coast Industrial Notes.

—A deposit of phosphates, such as are used in France as fertilizers for vineyards, has been discovered near Reno, Nevada.

—The Carson and Tahoe Lumber and Flume Company is reported to have bought the Sierra Lumber Company's business for $450,000.

—Vancouver, B. C., has decided to borrow $100,000 to erect an electric-light plant, to light the streets and for private consumers.

—Eastern men are negotiating for the purchase of 50,000 acres sugar pine on the Stanislaus, with intent to saw most of it into lumber.

—The California Petroleum and Asphalt Company of Santa Barbara is putting in an entire new plant. It is built by the Vulcan Iron Works.

—M. L. and D. Marsh, of Nevada City, have a contract to furnish 15,000 ties and 500 trolley poles for the new electric railway between Nevada City and Grass Valley.

—The H. G. Layng Machine Works has incorporated. Capital stock, $50,000. Directors—H. G. Layng, John Burke, John E. Layng, William E. Layng and Robert J. Layag.

—A Leadville miner says: "The gold bugs are the real fiat champions, as they offer a paper currency which they tell us will be redeemed in something the Government has not."

—Scott & Greenberg have incorporated, with a capital of $20,000, fully subscribed. Directors—Henry H. Scott, A. H. Greenberg, Marie Greenberg, William Kaiser and Frank Corde.

—The J. B. Cohen Company has incorporated. Capital stock, $20,000, fully subscribed. Directors — B. Cohen, Bruce Palmer, Edgar A. Cohen, A. B. Costegan and Donald A. Cohen.

—The Electric Power Company of Los Angeles has incorporated, with $1,000,000 capital, of which one-half has been subscribed by P. Kehl, E. C. Seymour and W. E. Van Slyke, of San Bernardino.

—Last week the Beason extension on the Arizona and Southeastern Railroad was finished, joining Benson with the Southern Pacific. The new extension parallels the Santa Fe tracks for eighteen miles.

—Northern Pacific earnings from the 1st of January up to September 7th were $8,957,767. For the remaining months of '94 the earnings will possibly reach $5,000,000, making the total earnings close to $14,000,000.

—A Williams, Arizona, lumber company has contracted to deliver by Feb. 1, '95, 1,500,000 feet of lumber to the United Verde Copper Company, and 13,200,000 feet to the Santa Fe, Prescott and Phœnix Railway.

—The Pacific Concrete Company has incorporated, with a capital of $75,000, of which $2500 have been subscribed. Directors—John W. Miller, Walter Foster, Louis Zimmerman, Harry F. Ingerson and Otto tum Suden.

—California produces annually 9,000,000 lbs. of cheese, and 31,116,000 lbs. of butter. The total value of dairy products amounts to $14,425,880, a sum which exceeds the total value of the State's fruit, grapes, wine and sheep.

—The San Francisco Sulphur Company has filed articles of incorporation. Capital stock, $50,000, fully subscribed. Directors—John Reynolds, J. L. N. Shepard, John Stauffer, John A. Wheeler and George T. Reynolds.

—The Southern California Lumber Company has incorporated, with a capital stock of $500,000, of which $2500 has been subscribed. Directors—E. C. Flagg, E. F. Burrell, E. A. Burrell, E. D. Connolly and T. E. Driscoll.

—Interest in the recent new oil discoveries at Los Angeles is unabated. A multitude of wells are sinking and the results in almost every case are satisfactory. Los Angeles is in a fair way to solve the problem of cheap fuel.

—The Ellensburg, Wash., Coal Company has been prosecuting work on its property near Cle Elum, and expects by the 10th to be delivering coal to consumers. They have a vein over five feet wide, and the quality is said to be superior to the coal mined at Roslyn.

—Spokane is figuring on putting in a city electric light system, by substituting dynamos for one of the pumps at the water works power-house. The plant would cost $40,000. The city pays $8 per light for arc lights, and it is claimed it could in this way get them for $4.50.

—A. J. Hayward of Tacoma, Wash., proposes to harness the Nisqually river by means of a thirty-foot dam, and thereby secure power enough to operate the city electric lighting plant and other plants as well. He estimates the cost of carrying out the project at $75,000.

—It is reported that a large packing house is to be started at Portland by Cudahy of Chicago. A recent report of the Department of Agriculture gave the number of swine in the Pacific Northwest, as follows: Oregon, 210,749; Washington, 162,977. The total number of swine in California, the report says, is 435,663.

—The salmon season in Alaska has closed. It is estimated that the catch will aggregate 700,000 cases, which, with what has already been sent down, will consume several months in shipping. Large quantities have been shipped to China and Japan, and other foreign orders have been large. The catch is larger than for some years past, and the fish are of good quality.

—The State Board of Fish Commissioners has filed its report with the Governor, showing what has been done in the past year toward advancing the fishing interests. In connection with the report it is shown that in 1880 the output of oysters for the entire Pacific coast was only 15,000 bushels, valued at $10,000. In 1892 the output of California alone was 178,645 bushels, valued at $698,257. This is the result of propagation and distribution. The Board recommends an extension of time of the salmon closed season.

—A New York dispatch says the General Electric Company has closed a contract with the Sacramento Electric Light and Power Company that calls for the transmission by electricity from a water power at Folsom, California, twenty miles distant, of several thousand electrical horse-power to the city of Sacramento to supply light, heat, power, etc., to an extent that will practically supersede all the present steam plants now in operation. This will make the longest transmission by electricity of power in large amounts installed in the world.

—The Portland, Or., papers say there are 3000 empty houses in that city. A million-dollar fire last Sunday night burned the Pacific Coast Elevator Co.'s main building and dock there, the coal bunkers of the North Pacific Terminal Co., the Oregon Railway & Navigation Co.'s dock, and the new plant of the Portland Electric Co., which had just arrived from Lynn, Mass., and had not yet been unloaded from the cars. Two hundred freight cars, eighty of which were loaded with wheat, 12,000 cases of salmon, and the steamboat Willamette Chief were also burned. The insurance aggregates $600,000. Notwithstanding all these losses and setbacks, Portland is a solid city and is only suffering temporary embarrassment.

Official Award.

Mr. Geo. E. Woodbury of this city is in receipt of the following: U. S. Department E, Mines and Mining: Exhibitor, Geo. E. Woodbury, San Fraacisco, Cal: Exhibit, an improved conceatrator with improved belts and feeder.

AWARD.

The construction is simple and strong. By a number of narrow belts the pulp to be concentrated is equally distributed, and is prevented from running one side to the other by reason of too much pulp on them. By expanded edges of the belts they are prevented from cracking; very good feeding arrangement; self-oiling shafts and boxes. The exhibit consists of a concentrator with seven narrow belts on one frame, which are so arranged as to receive a portion of the pulp on each belt in such a manner as to relieve the machine of its load. Signed: Reiji Kanda, Individual judge. Approved, H. M. Howe, President Departmental Committee; Jas. Boyd Thatcher, Chairman Ex. Com. on Awards.

MINING

DIPLOMAS AWARDED. Courses in other trades, all including thorough instruction in Mathematics and Physics. Send for FREE Circular, stating subject you wish to study, to **The Correspondence School of Mines, Scranton, Pa.**

Gold Quartz Mine For Sale.

MILLING PROPOSITION.

No money down. A 20-stamp mill must be erected and mine can be paid for out of product of mill. The property consists of two claims 1500x600 each. Width of ledge, 1½ feet to 4 feet. Ore runs from $10 to $20 per ton. $75,000 estimated in sight. Two tunnels run in on vein for some distance. Price, $30,000. This is a snap. Owner can be seen in San Francisco.

Further particulars, reports, etc., can be had of

J. F. CROSSETT, 628 Sacramento St.
SAN FRANCISCO.

FOR SALE.

TWO SETS KROM ROLLS, capacity 60 tons per day.
ONE IMPROVED BRUCKNER FURNACE, Revolving Screens, Self-Feeders, Rock Breaker, etc., etc.

—Apply to—

MALTMAN & THOMPSON,
Grass Valley, Cal.

TUBBS CORDAGE CO.
(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. Extra sizes and lengths made to order on short notice

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

Built solely by the

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
South Milwaukee, Wis., U. S. A.

Adamantine Shoes and Dies

—AND—

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 22 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies. Stamp Cam.

Electrical Progress.

The Prevention of Electrolysis.

At the annual meeting of the American Water-works Association, a report from the special committee appointed to consider the matter of the electrolyzation of water mains was submitted by Mr. Benzenberg. The recommendations submitted were:

To accomplish the prevention of electrolysis it is but necessary to prevent the pipe at any point from becoming positive to the rail or any other possible conductor. Whether the pipe is positive or not can be easily determined by a few observations with a voltmeter at points radiating out from the power house and along the line, where, by a perceptible difference in the potential between rails, the existence of poor or defective rail bonds is located. The facts and the points where the pipe is positive having been settled, the railway company should not lose a moment to re-establish the proper conditions for the protection of the pipe.

If not already provided, ample and suitable connection by an insulated cable should at once be made between the pipe and the generator to afford the least resistance for the proper escape of the current to its destination. If this has already been supplied, or the pipe is still positive, the rail bonds at such points should be perfected, and if the couditions are such that an increase of the section or number of such bonds will not entirely remove the difficulty, proper and suitable metallic connections should be made at such places betweeu the pipe and rail so as to permit the turn of the current to the rail until the proper equilibrium, dependent upon the relative resistance, has been established, without the necessity of passing the current through an electrolyte and of developing electrolytic action in the accomplishment of such result.

Insufficient rail section, inadequate return feeders, or especially wet soil, presenting an easy avenue for the current to reach the pipe, may make it necessary to add to the number of such connections, but they should only be made where the pipe is positive, in order to relieve the pipe, and for no other purposes. If this method be followed no damage, it seems, can arise to the pipe, but, to the contrary, the best possible protection given it against an agent whose permeating power it is impossible entirely to escape.

The only question which may arise iu connection herewith is as to the uniform conductivity of the pipe, whether there is sufficient resistance in the lead joints to cause some of the current to pass around and in doing so produce electrolytic action.

In a measurement made recently at the lead joint of an eight-inch water main in front of the power house of the Milwaukee Street Railway Company, through which main sixteen per cent of the entire output of the station (or 421 amperes) is being returned (thirty-one per cent being the entire amount returued through the water mains), a drop of potential of but 0.0198 volt was found to exist between the ends of the pipe, indicating a resistance of 0.000047 ohm, certainly uot sufficient to produce electrolysis even with the most favorable conditions existing at the joint.

But, do any favorable conditions exist? Professor Jackson, by his great number of experiments, has established that "in no case is the corrosive action due to the electrolysis of water; where oxygen is liberated at the anode, it does not attack the iron." And again: "In order to have the first electrolytic process go on—that is, direct electrolysis of iron—a soluble iron salt must be present in the soil, reaching from anode to cathode. The analysis of street soils shows no such salts."

Corrosion at the joints, therefore, can only be caused by the electrolysis of the soluble salts heretofore mentioned, if they exist between the hub end and the adjoining pipe at the joint. A most careful examination of the pipes and the lead joint in the eight-inch main above referred to, did not show the least perceptible action of corrosiou, although the main had beeu used as a conductor for years. It does not seem, therefore, that there is the least call for any anxiety that corrosive electrolytic action may take place at the lead joints, and, hence, a water main of like diameter may safely be considered to possess a uniform conductivity throughout and capable of conducting without injury so much of the curreut as under the law of divided circuits it cannot avoid conveying.

The eight-inch water pipe, where the same is connected by a 500,000 circular mil cable to the generator, was subjected on either side of the connection, in and under the clamps, to a most careful scrutiny and examination, but, notwithstanding the clamp aud the cable had not been touched for fifteen months, not even the least discernible change could be detected at any point. Where the iron pipe had been filed to form a contact with the clamp, the fine markings of the file were as sharp and distinct as on the day they were made. Other connections between the rails and pipe which were examined were found to be in good condition, and all possible information so far indicates that all corrosive electrolytic action on or along the pipes has been arrested.

Undoubtedly, electric street railway companies will soon, if they have not already, learn to appreciate the economy stored in a perfect return circuit of least possible resistance, and perfect, by improved copper bonds and return cable feeders, their present, in mauy instances, inadequate system.

The line of iuquiry and investigation for the water-works engineer to pursue and the remedy, if needed, to be demanded at the hands of the railroad company has been made clear at least by the investigations and experiments which have been made; and he can now, by his own observation, ascertain whether or not any part of his pipe system is endangered.

Ball Bearings for Motor Generators.

According to a description of a uew electric plant in Manchester, England, we learn that the motor generators are fitted with ball bearings. In commenting upon this an English engineer said the object of introducing this form of bearing was to reduce friction. A dynamo, with which he had been connected, had been running at a very high speed for a considerable time, aud the result had been a gain of ten per cent over ordinary bearings. In order to attain a successful result with ball bearings, the balls themselves and the races must be of the highest quality steel, and as hard as possible. Formerly wrought-iron balls had been used, and these had been casehardened, but the material was not suitable for the work, as the casehardening wore off and the iron gave way. It was desirable that the bearings themselves should be self-contained and easy to adjust; in some forms of ball bearing it was necessary to hold the balls in with fat when putting the bearings together. The ball bearing was held by a split cap, which acted as a spring, to some extent, so that it could be set up by tightening a single pair of nuts. The balls varied betweeu one-eighth inch up to two and one-half inches. The larger sizes were not hardened; the reason for this was that with these big diameters it was impossible, at present, to satisfactorily harden the races, and those using large ball bearings concluded that it would be better to keep both the ball and race soft, rather thau harden one and not the other. A lathe spindle was shown which was fitted with a ball bearing, and which had been running for five years continuously without showing any appreciable sign of wear.

In the United States Circuit Court at St. Louis, last week, the case of the Adams Electric Company against the Lindell Railway Company was decided in favor of the defendant. The suit involved millions of dollars and the issue was the validity of several inventions of electric motor devices, as applied to street railways. The Lindell Railway Compauy was the nominal defendant. The real defendant was the General Electric Company.

The law that a conductor cutting lines of force has au estimated motive force developed in it depending upon the number of the lines and the speed with which it cuts them, operates in a motor so as to produce a force in the armature in a direction opposing the excitiug force. On account of this counter estimated motive force the current which cau be sent through a motor armature by a given estimated motive force varies with the speed at which the armature is runuing; if it be forcibly prevented from turuing, the current is greatest, being simply due to the estimated motive force divided by the resistance, but when the armature is allowed to revolve the current decreases as its speed increases. This tends to make the motor self-regulating as to current absorbed in proportion to load and as to speed, for if the motor is having heavy work to perform, the the speed tends to become reduced, aud, therefore, the counter estimated motive force allowing more current to pass the armature, more power is given to do the increased work. Lighter work tends to allow the speed to increase, which develops more counter estimated motive force in the armature, reducing the current and cousequently the power.

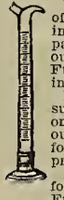
The very latest style of alternating current meter cousists of two vertical electro-maguets, the pole pieces of which are drawn out into peculiar curved horns, so to speak. Around the horns are wrapped at intervals thin copper bauds. Betweeu the horns or pole pieces is placed a light copper wheel attached to a spindle, to which are attached light mica vanes to cause the necessary drag. The current passes through the electro-magnets and causes liues of force to traverse from one horn to another. The passage of these maguetic liues of force, however, through the copper bands, tends to induce momeutary currents in them, and these momentary currents tend to obstruct the passage of the magnetic lines of force, which do not all traverse the pole pieces at their tips, but puff out, so to speak, at every baud of copper, and induce currents in the copper wheel, which cause it to be repelled and continuously rotated. The wheel actuates the usual counting gear. Of course this meter will only register alternating currents.

With constant current supply there has been no difficulty in driving motors, and one of the advantages urged in its favor was this fact; but uow the alternatiug current motors are receiving considerable attention from our electrical engineers. Many attempts have been made to produce such motors from designs like those of direct current ones, except that their field magnet cores had to be laminated as well as those of the armatures. Owing to troubles with self-induction and magnetic lag, motors constructed in this manner proved to be most inefficient. The motors which run with good efficiency, and which are likely to be largely used in alternating circuits, have for their principle the induction of currents in closed or "short-circuited" coils in the armature by an alternating field.

GOLD MINE
FOR SALE.
First class in every respect. Large body of ore in sight. Ten-stamp mill. Producing good profit every month. Former owner dead and heirs desire to close estate. It has a six-foot vein, $10 ore. See
J. F. CROSETT, 628 Sacramento St., S. F.

J. F. CROSETT,
Commission Mine Broker,
628 SACRAMENTO STREET.
I have five customers looking for income-paying mines for London, to be valued from $800,000 to $3,000,000. I also want ten income-paying properties for customers residing in San Francisco, Chicago, Denver, New York and Philadelphia. Owners of mines desiring to sell can make quick sales by seeing or writing me. I also invite investors to consider properties I have to offer.

Selby Smelting and Lead Company,
416 Montgomery Street, San Francisco.
Gold and Silver Refinery
—AND—
Assay Office.
HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.
Manufacturers of
BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.
Also Manufacturers of
STANDARD SHOT-GUN CARTRIDGES,
Under Chamberlin Patent.

John Taylor & Co.
Importers and Dealers in
Assayers' Materials,
Mine and Mill Supplies.
Also Chemicals, and Physical, School and Chemical Apparatus.
63 & 65 First St., Cor. Mission, San Francisco.


We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
M.C.C. BATTERSEA
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.
JOHN TAYLOR & CO.

Krogh M'f'g Co.,
MANUFACTURERS OF
Mining Pumps, Pan Staves, Leaching Tanks, and also the famous

Krogh Mining Hoist!
The best and cheapest on the market, and for strength and durability unsurpassed.
Send for Catalogue. 51 Beale St., San Francisco.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron, Zinc, Copper or Brass Screens for all purposes. CALIFORNIA PERFORATING SCREEN CO., 145 and 147 Beale St., S. F.

W. H. Birch & Co. (Incorporated)
Manufacturers of
Passenger and Freight Elevators,
Improved Steam Pumps,
Improved Corliss Engines,
Mining Machinery,
Cable Railway Machinery.
119 BEALE STREET, SAN FRANCISCO, CAL

QUICKSILVER!
—FOR SALE BY—
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1. - 426 CALIFORNIA STREET,
SAN FRANCISCO.

FOR SALE.
Two Mines of Free Milling Gold Ore.
For particulars address JAMES A. SCOTT, Reno, Nevada.

INVENTORS, Take Notice!
L. PETERSON, MODEL MAKER,
26 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential*.

Practical Information.

The Laboratory of the Oceans.

Whoever used the phrase "the great laboratory of the oceans" must have meant that the sea is the constant recipient of chemical elements carried by contributing streams for thousands of miles, the variety of which must be equal to the differences in the surfaces of the lands traversed by them. A recent writer in one of the reviews said that all the known elements—and even the unknown ones, too—must be contained in solution in the waters of the ocean. Rivers flowing over the land are continually taking up mineral matters in solution, and these substances are all added to the mass of mineral dissolved in the oceanic waters.

The Thames every day carries to the North sea some 2000 tons of dissolved material, and if all the rivers of the globe work at something like the same rate, 20,000,000 tons of mineral matter must day by day be added to the store of materials held in solution by the ocean. Now, all the chemical elements are capable of entering into compounds which are to a greater or less extent soluble in water, and hence we cannot doubt that in the enormous mass of materials dissolved in the vast body of sea water on our globe all the elementary bodies must be represented. It is true that the chemist, by his most refined methods of analysis, is unable to detect the proportion, even if he is able to determine the presence of the rarer elementary substances, which occur only as minute traces in sea water. When a large quantity of sea water is evaporated, we get a mass of chlorides and sulphates that can be separated by analysis; but even the very delicate tests of spectral analysis fail to make manifest many of the rarer metals and other elementary substances that must certainly be present in the mass. In a well-known case, the copper sheathing of a vessel has been proved to have taken up silver from the sea water by electro-chemical action, though it is probable that all our ordinary analytical processes would have failed to reveal the existence of the metal in the water itself.

A Bed of Natural Coke.

In the coal mines at Carbouado a miner, one day in working upward through one of the coal chutes, stuck his pick in the roof and was surprised to find a small deluge coming down upon him, says the Tacoma, Wash., *Ledger*. He was considerably alarmed and, as the water continued to pour through for some hours, it was thought that a hidden lake or river had been tapped. The opening was widened and the water soon drained out, when it was discovered that a surface fire many years ago had burned out the upper edge of the vein, which is tilted at an angle of 45 degrees, to a depth of about 70 feet, for a distance of nearly 200 feet.

Having burned down this far, the tilt of the vein made a sort of oven, in which coke had been formed. Then, apparently, the rainy season had come on and quenched the fire. In succeeding years the earth had closed over the great gap thus made, and above it several very large trees, one of them at least 500 years old, had grown. As the tree could not have grown, or even sprouted, when the fire was burning and, as it would have been destroyed by fire had it existed at that time, it furnished pretty conclusive evidence of the age of the coke. Some hundred pounds were taken out and brought to Tacoma and used. It was as good coke as had ever been found in the country, notwithstanding its extreme age.

CLINKERING depends upon two things —the temperature at which the coal is burned, and the composition of the ash. The fact that a coal does not clinker may be due to its impurity, the poor quality of the coal preventing it from making a fire hot enough to fuse the ash. On the other hand, a very pure coal may clinker, because it burns at a high temperature and melts its ash. A coal must have heat enough to melt the silicates it contains in order to make clinker. Generally the more bases there are in the ash the more fusible it is. Two coals, either of which burns without giving much trouble on account of clinkering, may clinker more if they are mixed, the reason being that the combination of the ashes of both is more fusible than is the ash of either separately.

Deep Mining.

At the recent meeting of the Iron and Steel Institute at Brussels, some interesting facts were recorded concerning the deep mine shafts of that country. As long ago as 1844 the late Prof. Devillez, of the Mons School of Mines, declared that shafts to a depth of 1000 meters could be successfully ventilated and worked, and his assertions are now borne out by current practice.

At Viviers the depth is 3760 feet, at Viernoy 3300 feet, though both these have been abandoned for lack of coal in paying quantities. At Prodict's colliery the shaft is 3800 feet, with an incline reaching to 3950 feet, the greatest depth yet reached in Belgian coal fields. The pumps required for drainage are necessarily powerful though small to come within the limits of restricted room. Foundations are sometimes omitted and the pumps bolted direct to iron beams built into the masonry. The pump at St. Catherine's shaft of the Boscoup colliery forces the water to a height of 1180 feet, while at La Louviere the head of over 1875 feet is handled by one pump on a direct line of piping.

THE money value of hands and fingers has been made the subject of an interesting estimate by one of the German miners' accident insurance companies. According to this, the loss of both hands represents a loss of 100 per cent efficiency, or, in other words, the whole ability to earn a living. Losing the right hand depreciates the value of an individual as a worker 70 to 80 per cent., while the loss of the left hand represents from 60 to 70 per cent of the earnings of both hands. The thumb is reckoned to be worth from 20 to 30 per cent of the earnings; the first finger of the right hand is valued at from 14 to 18 per cent; that of the left hand at from 8 to 13.5 per cent. The middle finger is worth from 10 to 16 per cent. The third finger is valued at no more than from 7 to 9 per cent, while the little finger is worth from 9 to 12 per cent. The difference in the percentages, it is explained, is occasioned by the difference in the trades followed by the injured ones.—Cassier's Magazine.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 4, 1894.

The stiffening in the New York lead market and the limp condition of silver make the chief luterest of the week. Big shipments of silver continue from here and New York to the far East, the New York shipments going via London. Outside of the United States, the circulatory requirements of the white metal continue. From January 1st to September 15,'94, London exported silver as follows:

India	£3,904,315
China	2,119,573
Straits	949,946
Total	£6,973,834
Same part of '93	6,874,255
Increase	£99,579

It will he news to many that from July 1st, '93, to July 1st, '94, the official returns of the exports of silver from the United States show a total for the year of $50,451,265.

The Director of the Mint has estimated and the Secretary proclaimed the present value of foreign coins. The changes are as ollows:

Bolivlars of Bolivia	$0.464
Peso of Central America	.464
Shanghai tael of China	.686
Haikwan tael of Cbina	.763
Tien-Tsin taels of China	.727
Chee Foo tael, China	.717
Peso of Colombia	.484
Sucre of Ecuador	.464
Rupee of India	.222
Yen of Japan	.450
Dollar of Mexico	.504
Sol of Peru	.464
Rouble of Russia	.571
Mahbub of Tripoli	.418

Copper shows firm, and though the output, both in this country and Europe, is on the increase the price has gone steadily up iu the last few weeks. It is quoted in Loudon at £42 5s, the highest in '94. For the first eight months in '94 this country produced 109,285 tons, aud Europe 59,620 tons.

There is some talk of "a new tin syndicate." Contradictory accounts come of lowering wages and threatened abandonment of new enterprises in that dircetion, under new tariff arrangements.

A writer in the Liverpool *Daily Post* says: The principal way in which it has beeu suggested as possible to reduce the cost of making tin plates in Wales to meet American competition, is by reducing the wages of the work people, or by the latter granting "concessions," which comes to the same thiug. To either of these methods the men's union have in the past offered, and coutinue in the present to offer, the most uncompromising opposition, preferring, as has been frequently declared, that the trade should leave South Wales and go to America as the alternative to any reduction of wages.

In coal there is in general a big supply and weaker prices.

For the first nine months of '94, exclusive of Mt. Diablo coal, the receipts here hy water were as follows:

	Tons.
Puget Sound	306,652
Oregon	21,100
Eastern	13,298
Australia	135,885
British Columbia	356,924
Englisb	92,786
Scotch	7,307
Welsh	19,201
Japan	13,137
China	2,500
Total	968,790

New York Prices.

Mining Share Market.

SAN FRANCISCO, Oct. 4, 1894.

The week was livelier in share dealing than for many previous months, there being a larger volume of business and a general advance in prices. The reports from the mines continue encouraging.

Following is a statement of the cash on hand in the office of some of the mining companies on the 1st inst:

Alpba	$3,538	Hale & Norcross	$14,968
Alta	644	Julia	429
Andes	14,669	Kentuck	3,643
Belcher	4,700	Mono	1,187
Best & Belcher	9,618	Mexican	12,674
Bullion	13,906	Nevada Queen	447
Bulwer	3,335	Occidental	609
Bodie	48,452	Ophir	488
Caledonia	5,385	Overman	7,794
Challenge	720	Potosi	30,233
Chollar	16,507	Savage	9,073
Church	17,283	Scorpion	174
Con. Imperial	1,768	Seg. Belcher	6,698
Confidence	3,355	Silver Hill	240
Con. New York	2,672	Silver King	2,025
Con. Cal	135,732	Sierra Nevada	20,217
Crown Point	3,981	Standard Con	31,409
E. Sierra Nevada	243	Syndicate	881
Excbequer	3,508	Union Con	9,310
Gould & Curry	12,991	Utah	189

The indebteduess of other companies on the 1st is reported as follows:

Commonwealth	$26,446	Navajo	$473
Grand Prize	640	North Belle Isle	2,368
Independence	567	N. Commouwealth	2,587
Lady Washington	350		

The monthly bullion statement of the Consolidated California and Virginia for September is as follows: Worked at Morgan mill 1586 tons of ore. Bullion produced — Gold, $88,163.72; silver, $45,715.88; total, $83,879.60. Yield in bullion per ton—Gold, $24.05; silver, $28,81; total, $52.87. Assay value of the ore per ton per battery samples—Gold, $24.13; silver, $35.10; total, $59.24. Assay value of the ore per ton per railroad car samples, $57.89.

In the Savage on the 1100-foot level in the north lateral drift from the east drift they continue to stope ore from the sill floor upward to the fourth floor. The south drift started from the face of the north lateral drift, was advanced twenty-one feet; total length, forty-one feet; face in quartz giving some assays. During the week they have hoisted fifty-seven cars of ore from this level. Car samples average $80.40 per ton.

On the 1050 level the south drift started from the east drift thirty feet from the south ore stopes was advanced eight feet; total length, eighteen feet; face in quartz giving some fair assays. The west crosscut started thirty feet north of the south boundary was advanced ten feet; total length, forty-eight feet; face is in quartz and porphyry. On the 1100 level the north lateral drift from the station was advanced twelve feet; total length, 351 feet; face is in quartz, clay and porphyry. The east crosscut started from the north lateral drift opposite the west crosscut was advanced forty-two feet, when it reached the last clay of the vein, and was discontinued. At a point in the north drift, thirty-two feet back from this crosscut, they have encountered some ore of good grade on the west side of the north drift. Have completed a new working station on the 950 level.

The following illustrates the changes of the week:

MINES.	27	4
Alpha	$ 14	$ 20
Alta Consolidated	20	19
Andes	70	76

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPTEMBER 25, 1894.

526,552.—PRESERVING PILES—C. Arnoudts, Seattle, Wash.

526,622.—WHEEL—H. P. Garland, Petaluma, Cal.

526,485.—BOILER FURNACE—J. Grogan, Prescott, A. T.

526,480.—BED-CLOTHES CLAMP—H. L. Jessen, Watsonville, Cal.

526,666.—BASIN TRAP—J. Marquis, S. F.

526,581.—HOTEL REGISTER—D. F. Riegle, Portland, Or.

526,511.—TEA CHEST, ETC.—C. Toobey, S. F.

526,512.—SEED PLANTER—Weber, Perscbl & Weber, Los Angeles, Cal.

526,474.—FOLLOWER—C. E. West, Santa Cruz, Cal.

526,476.—WRENCH—W. J. Wright, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FAUCET.—Charles H. Dutton, San Francisco, No. 525,948. Dated Sept. 11, 1894. The object of this invention is to provide an automatically closing faucet which is essentially closed by gravitation or the pressure of the water or liquid which it is adapted to control. It consists of a barrel having a vertical chamber at the end, the upper portion of which is larger than the lower, and having a valve seat at the junction of the two and below the passage of the faucet barrel, a hollow plug loosely slidahle in the lower portion of the chamber, a valve fixed to the upper end of the plug adapted to close upon the seat or to be raised therefrom to expose openings in the side of the plug below the valve, an inclined surface situated above the chamber, a yoke having its lower ends swiveled to arms connected with the lower projecting end of the plug, and a traveler adapted to move upon the inclined plane whereby the plug is lifted and the valve opened by moving the handle so that the traveler moves up the inclined plane and is closed by gravitation and pressure when the handle is released.

REVERSIBLE OVERLAP DISK HARROW.—Thos. B. Montgomery, assignee to the Benicia Agricultural Works, of Benicia, Cal. No. 525,960. Dated September 11, 1894. This invention relates to improvements in that class of land-tilling implements known as disk harrows, in which a series of saucer-shaped disks is mounted upon shafts carried upon a main frame, so that the edges of the disk act to dig up and cultivate the soil. The concave-convex disks are fixed upon shafts, the journal boxes of which are attached to the beams of the frame, and these beams have a swivel connection between themselves and the main fixed frame, which connections consist of boxes having ball or other shaped chambers, and spindles passing through them with enlargements to fit the chambers, the spindles having the upper ends passing through and adjustably fitted in slotted ends of the maiu frame, and the lower ends extending into the tops of the harrow beams. The two series of disks, heing mounted upon separate shafts journaled from the beams turnable about the vertical axis with relation to the main draft frame, may be adjusted with relation to the linc of travel, and may be reversed so as to present the concave faces inwardly or outwardly, and the heams are also movable so that the disks will overlap and leave no uncultivated space between them.

PAPER CAN.—Geo. H. Bartlett, Tiburon, Cal. No. 525,937. Dated Sept. 11, 1894. The object of this invention is to provide a can with eomplete pasteboard or paper sides and euds, and a means for unitiug them with the smallest amount of metal, and to provide an opening or closiug device whereby the contents of the can may he easily reached or the can hermetically closed. The can comprises an open-ended pasteboard body, pasteboard ends therefor, metallic rings embracing the adjacent portions of the edges of the body and its ends so as to clasp them togetner, one of the ends having an opening and a corresponding ring having a raised inner portion with a cap portiou in a space under said raised portion, and also having a eutaway portion to register with that in the end, so that the parts are firmly connected together while only the pasteboard is exposed to the interior contents of the can, thus preserving them from contact with metal and at the same time enabling the user to open or close the can at will and keep the coutents practically protected from atmospheric influence.

CIRCULATING TUBULAR BOILER.—Edward L. Martin, Kern, Cal., assignor to the Locomotive Feed Water Heater Co., Bakersfield, Cal. No. 525,958. Dated Sept. 11, 1894. This boiler belongs to that class of tubular boilers in which a supplemental heater located in the fire box is connected with the injector from the cold water tank and with the boiler. The improvement consists, in connection with the supplemental heater, of a pipe leading from it above and entering the boiler, the pipe leading from the lower portion of the boiler aud entering the lower portion of the supplemental heater, and the second or auxiliary pipe leading from the lower portion of the boiler and entering the lower portion of the supplemental heater; the objects of the supplementary pipe being, first, to provide for the continuance of the circulation if the main circulating pipe be clogged up, and, second, to provide a means for blowing off the supplemental heater when necessary. For this second purpose the supplemental or auxiliary pipe has a valve in its lower portion.

Octrooi-Aanvrage

Voor Methode om Goud en Zilver van Hunne Oplossingen in Potasch Cyanide Aftescheiden.

Register-Nommer 683.

Ter algemeen naricht wordt hiermede bekend gemaakt dat William David Johnston van beroep scheikundige op den 31sten dag der maand Juli, 1894, en woonachtig te San Francisco, Amerika, te mijnen kantore gedeponeerd eene aanvrage voor een octrooi voor bovengenoemde uitvinding met bijbehoorende beschrijving.

Nademaal nu de gezegde William David Johnston mij schriftelijk heeft kennis gegeven dat bif met deze zijne aanvrage wenscht voort te gaan, heb ik bepaald dat deze aanvrage en alle bezwaren daartegen zullen worden behandeld te mijnen kantore op Vrydag, den 14den dag der maand December, 1894, ten 3 ure 's middags.

Ik roep daarom alle personen op, die er belang bij hebben zich te verzetten tegen het uitreiken van een octrooibrief voor gezegde uitvinding aan gezegden William David Johnston om ten minsten zeven dagen voor genoemden datnm van behandeling te mijnen kantore te deponeeren een geschrift, waarin zij hunne bezwaren ontwikkelen, daar zij anders uitgesloten zullen zijn, die voor te brengen.

Aldus den 2 den dag der maand Augustus, 1894, te Pretoria, Zuid Afrikaansche Republiek.

CARL UEKERMANN, Sr.,
PAULNEL, Registraleur van Octrooien.
Gevolmoentigde.
Argus Maatschappij Beperkt.

Mining Pipe!

STEEL OR IRON.—We make pipe of either, but recommend STEEL, it being superior to iron in many particulars and inferior in none.
COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Malthu.
COMPETITORS.—Our competitors say we have the best appointed Pipe Shop on the Coast.

SCHAW, INGRAM, BATCHER & CO., Hardware Merchants,
SACRAMENTO, CAL.

Thomas Price & Son,

Assay Office, Sampling Works

And Chemical Laboratory.

524 Sacramento Street, San Francisco, Cal.

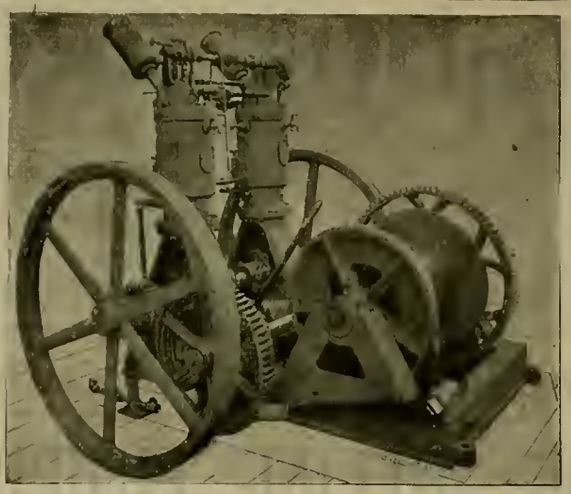
Double Acting Cornish Plunger

Pumps twice as much water as the old Cornish pump and "only one-third the weight."
SPECIAL CONSTRUCTION OF STEEL for packing on mules, only one-twelfth the weight of the ordinary Cornish Plunger.

IMPROVED SINKING PUMP.

Bucket and cluck changed under water, saving expense of putting down another pump when the bucket or cluck gives out under water. Bucket gearing lasts six times as long as the old gearing.
First outlay one-third less and works with ten per cent less power, "paying for itself in one or two years, according to the price of fuel."

WM. NANCE.....Grass Valley, Nevada County, California.



The Golden Gate Gas Engine

is not a new comer, but has not been advertised in the papers as some others. If you are in need of a Gas Engine, just ask anyone whoever has anything to do with them, and they will tell you:

Get the Golden Gate.

USES GAS or GASOLINE.

For a Cheap, Compact and Reliable Hoisting Outfit correspond with

Adam Schilling & Sons,

211-213 MAIN St., San Francisco,

The "GOLDEN GATE" is made strictly according to its own Letters Patent Issued.

STANDARD ELECTRICAL DICTIONARY.

By Prof. T. O'CONOR SLOANE.

Author of "Arithmetic of Electricity," "Electricity Simplified," Etc.

The "Standard Electrical Dictionary" is what the work purports to be, exhausting the subject of electrical terms, giving each title the clearness of explanation necessary to make the understanding of it complete, without unnecessary elaboration. In this work every electrical word, term or phrase will be found intelligently defined.
The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the every-day electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of the greatest science of the times.

624 Pages. 350 Illustrations.
Handsomely Bound in Cloth, 8vo. PRICE, $3. Extra Super Calendered Paper.

What is said of the STANDARD ELECTRICAL DICTIONARY.

The dictionary gives evidence of a large amount of painstaking work on the part of the author, and possesses features which must be commended. Among these, the author, wherever occasion required it, has furnished the synonyms of terms, and the book is given an additional value by an alphabetical index, which enables it to be consulted for terms both collectively and individually. The work will prove of value to the reader, whether professional or non-professional. The definitions are put tersely and concisely, so that the inquiring reader can carry away a defined, net impression as to what is meant. Any student who will spend his leisure hours over the volume will be amply repaid for his time and trouble. The book is very clearly printed in bold type on good paper, and is well bound.—*N. Y. Electrical Engineer*

MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12 X 36 INCHES, THE MINE BELL SIGNALS AND RULES PROVIDED FOR IN the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market Street, San Francisco, Cal.

RISDON IRON WORKS.

Office and Works: Cor. Beale and Howard Sts., San Francisco.

Cable Address: "RISDON'S" San Francisco.

MANUFACTURERS OF

Johnston's Concentrator, **Bryan Mills,**

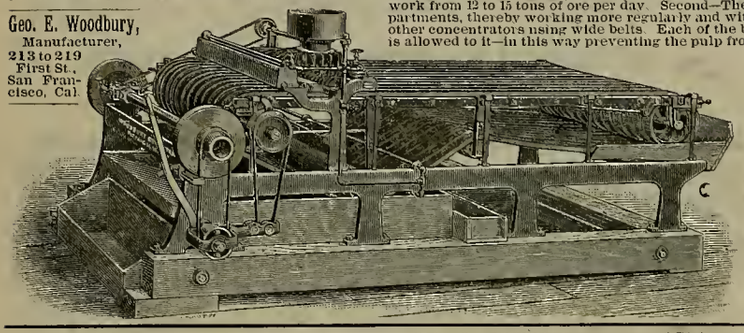
Challenge Ore Feeders, **Air Compressors,**

MINING, MILLING, PUMPING and HOISTING PLANTS.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 213 to 219 First St., San Francisco, Cal.



PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1894.

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXIX. Number 15. SAN FRANCISCO, SATURDAY, OCTOBER 13, 1894. THREE DOLLARS PER ANNUM Single Copies, Ten Cents.

Largest Air Compressing Plant.

The Nottingham colliery at Plymouth, Pa., is the largest producing coal mine in America. Low steam pressures available at the pumps together with the expense of maintaining a safe roof in the passage ways through which the steam pipe ran, the liability to accident and interference with the ventilating currents in case the steam pipe was broken, together with a number of other objections, induced the management of the company to look for some other method of transmitting power.

The contract was awarded to the Ingersoll-Sergeant Co., and work on the plant was commenced at once and pushed rapidly to completion. It has now been in constant use for several months and fully meets the requirements of the work and the expectations of the officials of the company.

Fig. 1 shows a perspective view of the air compressors, erected near the head of the shaft. There are two pairs of piston inlet duplex compressors with steam cylinders 28 in. x 48 in., and air cylinders 34½ in. x 48 in. It will be noticed that the compressors are set side by side, and that the steam ends are of the Corliss type. The fly-wheels weigh 50,000 pounds each, and they are placed between the duplex cylinders. Under ordinary conditions, but one pair of the compressors is run at one time, the other pair being held for reserve.

The perspective view (Fig. 1) shows the method of connecting the governor to the wrist plates. In case the governor belt should break, the engine is stopped automatically by the device shown in Fig. 2. (See page 228.)

In this arrangement the trip collar has two toes, *A* and *B*, the former regulating the cut off, under ordinary conditions, in the usual manner. In case the governor belt breaks, the balls fall, the trip is pulled to the right, the toe *B* releases the block *D*, by striking one arm *E* of the disengaging link or crab claw, forcing it outward so that the dash pot can operate as if it was cutting off. The toe *B* is so located that the block *D* cannot engage again while the balls are down, because the arm *F* of the crab claw is riding on its back, and will not permit the arm *G* to get near enough to the block to engage with it. This shuts the steam off from both cylinders and the engine will stop as soon as the resistance overcomes the momentum of the moving parts. The toes and the part of the crab claw which they touch, indicated by heavy shading, are all made of hardened steel. The cut off varies from one-third to seven-eighths stroke.

Indicator cards show that with a mean effective steam pressure of fifty-one pounds per square inch, the horse power of each cylinder is 410, or 820 for each pair, making the total indicated horse power of both pairs of engines 1640. The water consumption shows a total of 21.78 pounds per indicated horse power per hour. Taking nine pounds of water evaporated per pound of coal as a fair allowance, we have 2.42 pounds of coal used for each indicated horse power per hour—a very creditable showing.

Fig. 3 shows a longitudinal section, cross-section and rear end view of one of the air cylinders. It will be noticed that the piston is hollow, and in addition to the usually solid piston rod, there is a hollow rod which extends through the back cylinder head. This hollow piston and rod afford means for the admission of free air to the cylinder. The method of accomplishing this is an extremely ingenious application of Newton's first law of motion. *H* and *I* are large metallic rings, shaped as shown in the longitudinal section. These rings have oblong

EDITORIALS.—Largest Air Compressing Plant, 225–228–229. Advertising the Mining Industry; State Debris Commissioner; California Platinum; Old Quartz Mines, 226. Sulphur, 226–227. The Miners' Convention, 227. The Late James H. Crossman, 231.

CORRESPONDENCE.—California's Greatest Resource; The Black Sand Gold Question, 230.

SCIENTIFIC PROGRESS.—Pumping Wind into the Earth; A World-Circuit Telegram; A Faded Signature Brought to Light by the Camera; Easy Climbing at Night, 232.

MECHANICAL PROGRESS.—Hydraulic Propulsion of Vessels; Crude Oil as Fuel; Miscellaneous, 233.

ELECTRICAL PROGRESS.—Electricity in War; Interior Electric Lighting; Storage Battery Boats, 236.

PRACTICAL INFORMATION.—A Gun Manufactory in China; Teaching Blind Girls to Cook; Drying Mercury, 237.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 234–235.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 238.

MISCELLANEOUS.—Concentrates; Personal, 227. Boy Stomach Power; The Genesis of Gold Placers; Miscellaneous, 229. Will Purchase the Mine, 230. Mining Operations in Alaska; New Chlorination Works; The Lesson of a Naval Battle; The Pelton Water Wheel, 231. A Simple and Compact Gas Engine; Coast Industrial Notes, 235. Patents, 238.

Advertising the Mining Industry.

The supervisors of Nevada county have made an appropriation to establish and maintain at the State Board of Trade Rooms in San Francisco, a permaneut exhibit of the product of their mines. This is a move in the right direction. The Board of Trade rooms are daily visited by hundreds of people in search of information about California's resources. Thus far the exhibits have been almost entirely of an agricultural character. The mines and manufactures have been ignored or neglected. If Nevada county thus calls attention to her mining interests, other counties will feel called upon to do the same.

The raisin, orange, prune, nut, wine and other industries make extensive permanent displays at the State Board of Trade, yet their combined annual product by no means reaches that of the mining industry, which is not represented at all; in fact, our miuers do not take half the trouble they should in advertising their interests. They keep too much to themselves, unless they have a mine to sell. Very few will ever take the trouble, for instance, to write letters to the PRESS (which is always glad to publish them) concerning the progress of their camps. People looking for investments in miuiug properties have to find out as best they can where to look, for the miners give very little help, indeed.

The State Mining Bureau has a magnificent collection of ores and minerals at its museum in the Pioneer building on Fourth street, but this has been collected piece by piece from individuals. The counties, as a body, have never made any special efforts to provide complete collections of their own mineral products. This they should, however, do, something after the manner it was done at the Midwinter Fair. The Mining Bureau is really the place where the most complete displays should be made, and these could be supplemented by smaller exhibits at the State Board of Trade, with printed reference to the more extensive ones at the Bureau.

Thousands of people who come to this State looking for fields of investment would be attracted to the miuing regions were the resources of those sections properly advertised. The wine, raisin, orange and fruit men keep advertising persistently, and many investments are made in those directions. The miners, however, seldom take the trouble to tell anybody publicly what they are doing, how much they are makiug, or what they have for sale. It is time for the miniug community to wake up out of its "'49" sleep and let people know that it is awake and ready for busiuess.

State Debris Commissioner.

John F. Kidder, the State Debris Commissioner, has filed his report with Governor Markham. The storage capacity of dams already constructed is 21,336,723 cubic yards of impounding reservoir. The Board had sixteen meetings, at the majority of which he has been present, aud he has also visited in company with the United States Engineers a majority of the mines applyiug, some of them being of such a nature as to not necessitate his visiting them.

He thinks that the aid of the Government should be extended to build restraining dams, and begs the Governor to urge the Uuited States to make an appropriation with the $250,000 conditionally appropriated by the State. He also recommends that the Debris Commissioner of California be made a member of the United States Commission and have a vote therein. The Federal Commissioners are in accord with him in that plan. The most cordial relations exist betweeu him and them.

In order to carry out Mr. Kidder's recommendation some Congressional action will be necessary, since uuder present laws he cannot well be made a member of the United States Commissiou. It will be remembered that Mr. Kidder is holding his office under a law which the State makes an appropriation for debris dams only under condition that the United States Government does the same thing. The Government has not done this, so that thus far Mr. Kidder has been working without any money to work with, or even any salary.

It is really going to be a somewhat difficult matter to get Congress to appropriate $250,000 to match the State's conditional appropriation for debris dams in the rivers. Congress would not do this unless the request were backed up by the recommendation of the members of the U. S. Engineer Corps, U. S. A., who now form the Californuia Debris Commission, and this recommendation, it may be confessed, will hardly be made. It is generally understood that the members of the California Debris Commission are averse to any Government appropriation for this purpose, being of the opinion that the present system of each mine paying for its own restrainiug works is preferable and proper.

This being the case, it does not look as if the State appropriation would ever be available. If the miners appeal to Congress for an appropriation, the opiuion of the engineers will be asked before it is made, and if they, through the War Department, report adversely, then Congress will do nothing.

It is just as well to recognize this fact first as last. There is little real use in passing a lot of resolutions and petitioning Congress to do something which there is little or no hope of its doing. It is a fact that this measure of relief must meet the approbation of the local engineers or it will be no further considered. It may be that these gentlemen have not, as a body, come to any decision on the subject; in fact it has not yet come before them in an official way. But it is understood that, as individuals, they see no reasou for Congress to appropriate moneys for the purpose specified. It is possible, however, that they might be brought to see the need of two or three dams at certain points to keep back debris already in the rivers and now slowly moving down, since in their original report they referred to the desirability of such dams. Congress can never be made to set aside money for any dams behind which any mines may deposit their debris, since if it does anything at all it will be for the benefit of the rivers and not for the benefit of the miners. The individual dams will still have to be built in any event.

This matter will doubtless come up before the Miners' Convention, and those who expect to be delegates should give it consideration at this time, so as to be prepared to discuss it thoroughly.

California Platinum.

That rare and expensive metal platinum is found in several places in northern California and southern Oregon, but nowhere else in the United States, and it seems strange that so little effort is made by the miners to save it. It is found in many of the hydraulic mines in Sierra, Plumas, Trinity and Siskiyou counties, in company with the gold; but the whole product of this country is not over one or two hundred ounces per annum. In cleaning up the sluices from these hydraulic mines the platiuum settles with the gold, amalgam and black sand, but it is generally thrown away with the latter.

It is not a very difficult operation to separate the platinum from the concentrated black sands, but very few of the miners pay any attention to its presence. Perhaps this is due to its comparatively small quantity or a mistaken idea as to its value. At all events, there is a very small amount obtained, though its presence is known in many places. In the gold washiugs of Russia, every care is taken to collect this substance, and the world's supply is obtaiued from there.

It would pay our miners who are working gravel claims where platinum is found to take the proper steps to save their black sands and treat them for this substance. It is in great demand and very expensive, beiug altogether too valuable to be allowed to go to waste, as is doue geuerally at present.

Old Quartz Mines.

A very encouraging feature of the present gold mining outlook in this State is the rehabilitation of old quartz mines which were partly opened and then abandoned twenty years or more ago, when the conditions surrounding mining operatious were very different from what they are now. At that time we had very extravagaut ideas as to the profits of quartz mining and the methods of conducting it. Small economies were not practiced or even thought of. Superintendents, with little to do, were paid exorbitant salaries, and the whole system was "top-heavy" with useless supernumeraries in the way of salaried officials. Moreover, machinery and all sorts of supplies were very expensive, and means of transportation inadequate and costly. It took more than twice as much to equip a mine as it does now, and about three times as much to work the ores. In consequence of these conditions numerous mines were opened and outfitted which could not possibly pay under such circumstances and they were finally abandoned.

In these days of economy in administration, cheapness of operation and low cost of transportation of ores, these old mines will pay well, as experience is proving every day. The most noticeable instances are those of the three largest gold producers in the State, the Utica at Angels, Calavaras county, the Kennedy at Jackson, Amador county, and the North Star at Grass Valley, Nevada county. All of these mines were idle for years after having been worked for a time. When they were finally taken hold of by men of means and experience, who put capital into them for proper development and equipment, and managed them on a business basis, they at once began to pay handsomely.

These examples—a few of the many which might be cited—should be sufficient to show what can be done with these old mines. A good many men are looking them up in California in these days, hunting up their records and considering the advisability of reopening and equipping them. Numbers of such claims are in the hands of men without money, and will be useless as long as they remain so; but when capital is interested the mines can be made to pay well.

Sulphur.

Large quantities of sulphur are consumed in this State for sulphuring vines, manufacturing sulphuric acid, refining petroleum, fertilizers, etc., but none is produced here. There are, however, several known deposits, but they are not worked. Formerly considerable quantities were obtained at the Sulphur Banks in Lake county, but it is not now mined there. There are extensive deposits in Kern county but they have never been utilized. In fact, there is now no sulphur miued in the United States except at Black Rock, Utah, where the Utah Sulphur Co., formerly the Dickert & Myer Sulphur Co., is operating.

Those mines produced last year 1200 short tons valued at $42,000—spot value. In 1892 the product of the same mines was 2688 short tons, valued at $80,640. In 1889 the Banner mine, near Frisco, Utah, and the Wise mine, at Winnemucca, Nev., both produced some sulphur. The output of that year was 1150 tons sulphur ore, yielding 450 tons refined sulphur.

All the sulphur used on the Pacific coast comes

from Japan, and it is so cheap and of such good quality that our own produce cannot compete with it, coming as it does by the shipload. Last year we imported at San Francisco from Japan 7766 tons crude sulphur valued here at $125,507; the previous year a little less only; and in 1890, 8819 tons valued at $115,637. The figures for 1891 were 7256 tons crude, valued at $127,797. The Eastern States get all their sulphur from Sicily. The Italian (or Sicilian) imports to this country for three years were: 1891, 101,660 long tons, value $2,140,516; 1892, 90,668 long tons, value $2,147,942; and 1893, 103,146 tons, value $958,303.

The Japanese sulphur is landed in San Francisco for a less price than the freight alone would be from Utah to California, and our own deposits in Kern, Lake and other counties could not possibly pay to be worked under present conditions. This Japanese sulphur, though called "crude," is very pure in quality, running up to 98 and 99 per cent. Even the second grade is 96 and 97. The dealers who sell it as "sublimed" sulphur merely grind it finer, and do no refining whatever. It has driven the French refined or sublimed entirely out of the market, except, perhaps, a very little for chemical laboratory purposes. In Japan they have immense quantities which may be obtained and shipped at very low figures. Neither the Nevada nor California deposits can compete with these abundant supplies. About all that is imported at San Francisco is used on this coast, so the imports stated above indicate the amount of coast consumption.

The Miners' Convention.

The annual convention of the California Miners' Association will take place in this city on the 19th of next month, having been postponed by the executive committee of the association so that it would occur after the elections, in order that politics should cut no figure in the deliberations.

The different branch county miners' associations should see to it that they are well represented at the convention and that only those are chosen as delegates who will attend. It is of the utmost importance to the mining industry of this State that the miners stand shoulder to shoulder and united in their common cause. By this means they may accomplish whatever is needed to advance their interests. If they relax their efforts or fail to realize the advantages of unity of action, they have only themselves to blame should legislation adverse to their interests be enacted.

It is not by any means hydraulic mining alone which needs protection. That interest is now getting on very well indeed. The quartz and drift mines are both laboring under burdens imposed upon them by foolish laws and absurd Department rulings.

The attention of Congress must be forcibly called to the miners' needs. If this is properly done there will be no difficulty in obtaining the necessary relief. But the demand must come from the miners as a body rather than from Representatives in Congress, in order to be properly received and acted upon. At the coming convention several pending measures will be studied up and criticized and it will be well for all the counties to be well represented.

The following circular has been sent out by the executive committee of the State Association:

CALIFORNIA MINERS' ASSOCIATION,
Headquarters—Room 2, ninth floor, Mills Building,
SAN FRANCISCO, October 4, 1894.

To the Miners' Association of ——— County—GENTLEMEN:—At a meeting of the general executive committee of the California Miners' Association, held on Monday, September 10th, it was decided by a unanimous vote to postpone the annual convention of the association from October 8, 1894 (the time it is usually held), to the third Monday (19th) in November.

At that time the elections will have been held and our Congressmen chosen, and we can ask them to meet with us in the convention and express their views regarding national legislation on questions affecting the mining industries.

The platforms of both the Republican and Democratic parties in this State declare in favor of the rehabilitation of the hydraulic mining industry, showing that the popular voice seconds our efforts in this direction.

The daily press of San Francisco, and many of the papers of the interior, have spoken plainly of the necessity of proper legislation regarding the proving of mineral lands before the Land Office, and it is evident that the time is ripe for a reform of the abuses which now exist.

The Newlands mining bill, now pending in Congress, should receive the attention of all quartz and drift-gravel miners, who should support it and urge its passage in every way, and do all in their power to defeat the Stewart mining bill, also pending.

Not only the cities, but the farming communities, look to the gold miners of the State for help to tide over the existing depression in business affairs.

This will be the golden opportunity for the miners of California to show by their numerical strength at the next convention their importance as factors in the industrial advancement of the State, and to urge the necessity of proper national and State legislation to aid an industry the product of which adds such substantial wealth to our country, and gives employment to so many men, and which by suitable encouragement may become still more important and productive.

EXECUTIVE COMMITTEE CALIFORNIA MINERS' ASSOCIATION,
Per W. C. RALSTON, Secretary.

DRILLING CONTESTS seem to be getting fashionable among the miners. We hear of them in all the mining States and Territories of late, and there is evidently a very spirited rivalry among local teams in all the places. These contests are good for the men and good for the employers as well, since after a man has once established a reputation as a rapid driller he will have to "keep up his lick" in everyday work as well as at exhibitions. Superior skill should bring an increase of wages also, but this does not seem to be taken into consideration as much as it should.

Concentrates.

THE New London mine, Amador Co., is being equipped with a new hoist.

THERE are about 500 men now prospecting and working at Kennedy, Nev.

THE specie shipments from San Francisco during September aggregated $2,439,431.

THE Bodie mine cleared up after a crushing 581 tons in 29 days and obtained from the whole run $73,173 in gold.

THE drillers who took part in the Admission Day contest at Sutter Creek have decided to have a "redrilling" on October 20th.

VOORHEIS & BARNEY'S sulphurets works at Jackson, Amador county, have closed down for a while, as they have no more ore on hand.

FIVE THOUSAND DOLLARS in gold was shipped from Silver City, N. M., last week, much of which came from the mines at Piuos Altos.

THE Dunderburg mine, near Bridgeport, has been bonded by a San Francisco company, which will soon commence work under the conditions of the bond.

THE San Francisco Mint coined $1,919,500 in gold in September. The gold coinage at the local mint for the year up to Sept. 30th has been $15,304,500.

THE working force at the Champion mine, Nevada City, is being gradually increased and in a little time as many men will be employed there as before the late injunction was served.

A LOT of ore buyers met at Spokane, Wash., the other day to bid on $100,000 worth of ore from the Slocan Star mine in Slocan district. The Omaha and Grant smelter captured the contract.

WOLF CREEK, OREGON, seems to be doing well this year. Sales are being made and all ground and ledges that are worked properly are yielding good results to their owners and operators.

NEGOTIATIONS are in progress for the erection of a smelter to treat the ores of Trail Creek district, Wash. O. Bergstrom, assayer for the Colorado smelter at Butte, is working up the project.

J. D. TOMLINSON, the purchaser of the Jennings mines on the Hassayampa, A. T., has torn down the Red Buck mill at Walnut Grove and is preparing to move the same at once to its new location.

THE company owning the Lucille, at Plymouth, Amador county, have got control of the old Hendy mine at Nashville, just across the river in El Dorado county, and have a force of about twenty men at work there.

THE Resources Consolidated quartz claims, near Sweetland, Nevada Co., have been sold by the owners, Hon. R. I. Thomas and others, to W. H. Aubury of New Mexico and Hon. M. J. Farrell, formerly of Grass Valley.

W. M. HANNUM has sold 80 acres of placer ground in Grave Creek district, Oregon, to A. A. Davis and Mr. King of Medford, who will lay a 15-inch pipe and be ready for active operations by the time the fall rains set in.

THIS promises to be a winter of peace, industry and prosperity at Cripple Creek. Preparations have been made for steady work, and the monthly output of the mines there will increase right along despite snow and cold.

THE Gutheridge & Thornburg placer ground on the north fork of the John Day river, Oregon, has been sold for $15,000 to Utah men—C. E. Jennings of Salt Lake, and B. S. Kimball, L. P. Kimball and F. R. Davis of Park City.

J. H. READER has leased his Shady Creek mine, Nevada county, to A. B. Driesbach & Co. of Penn Valley, for five years, for $2,500. The mine is a creek bed placer claim, and was worked as far back as 1861 and 1862. It paid well in those days.

AN assayer who thoroughly understands the situation thus defines a "strike" as applied to mining properties: "What I call a strike is when the owner or lessee of a mine takes out the ore, ships it and gets the money in his pocket. That is a strike and one that counts."

THE Standard Consolidated Company, of Bodie, have begun the erection of a big dam across Green Creek above the dynamo. The dam will be from thirty-five to fifty feet high. Four-fifths of a mile of pipe will be laid. Every available man in Bridgeport has been engaged for the work.

THE T. H. Steel & Company mine, situated near Brownsville, Yuba county, has received a permit from the California Debris Commission to begin operations. The Commission will view the workings of the mine when ready to start, and can then decide if it is operating according to law.

THE Horn Silver Mining Company of Utah has elected the following officers: Allan C. Washington (President), Juan M. Ceballos (Vice-President), P. T. Farnsworth, Bache McE. Whitlock, Theodore B. Moore, John Sharp and Frank W. Jennings. Ambrose L. Harrison is Secretary and Treasurer.

THE sale of the Red Chief group of mines at Cable Cove, Oregon, has been consummated, Messrs. Frank E. Plummer and Chas. Cupernell, of Des Moines, Iowa, being the parties purchasing the properties. The parties selling were Major F. T. Glisan, J. B. Taylor, E. L. Giroux, Richardson and others.

BOULDER DISTRICT is a new one, about ten miles southeast of Silver City, Idaho. About thirty men are now employed in the district developing claims which are showing up very satisfactorily. The district covers a considerable extent of territory. The ledges are large and the most of them are gold producers.

ONE HUNDRED AND SIXTY-FIVE THOUSAND DOLLARS in dividends is the record of the Centennial-Eureka Mining Company of Utah, during the past year ? general mining depression. The ore sales aggregated over a quarter of a million and the treasurer now has a surplus of $77,924. This was the showing made at the annual meeting of the stockholders.

THE wages paid on the Randt last year for labor were to whites £1,252,491; to the natives £1,100,855; total, £2,353,346, and yet there are some people who are continually groaning and mouning about the crimes and misdemeanors of the white man in Africa. Why, before he discovered this gold field the Randt was itself a howling wilderness, and certainly no wages were paid.

A CORRESPONDENT has the following to say to those intending to go to the camp at Kennedy, Nev., for the winter: "Stay where you are, for we have plenty of working men here at present, but in the spring when capital erects more mills and smelters, which will be done, then Kennedy will extend and give labor to hundreds of people. Then we will welcome the laboring man."

A STATEMENT made by Southern Oregon papers that the Mollie Hill, one of the big mines of Reuben creek section, had been purchased by Jacob Kamm, of Portland, and that he is putting up a stamp mill there, was, it appears, premature. Mr. Kamm says he was negotiating for the purchase of the mine, but, as there was some doubt in regard to the title, the sale was not made.

THE White Swan mine, Baker City, Oregon, has been purchased by Mr. G. S. Tarbell, the original discoverer of the mine and who realized several thousand dollars in dividends from the property while it was operated by the White Swan Company. It is expected that it will take from twenty to thirty days to clear the mine of water, when a full payroll will be put on and the mine operated to its full capacity.

PLACER mining along the Columbia river is receiving an impetus that promises to develop into settled mining operations. The scene of the present excitement is at Troy, twenty miles north of Wenatchee. The high water in June washed off many bars where Chinamen have been known to mine years ago. The ground is found to be very rich. New camps are being made every day along the river, and that section promises new developments right along.

MESSRS. O. H. JONES and John Dibort are in from the Old Glory camp. The former is going to his ranch at the Oracle, and the latter is doing duty as a juryman. They report the "Old Glory" as a prosperous camp. The machinery will soon be in place and in readiness to move within a week or two. The mine looks splendid and the ore in sight of vast proportions. Everything about the camp is done in a first-class manner, denoting permanency.—Tucson Citizen.

TRINIDAD (Colo.) people are greatly excited over the recent gold finds in Costilla valley, just west of Trinidad, at the camp called La Belle. A town site has been located and about 300 prospectors are taking up and working claims. The ore is easily mined and yields from $8 to $500 per ton. The camp is 30 miles from the end of the Catskill branch of the Gulf road, and 50 miles to the Denver & Rio Grande in the San Louis valley.

THE idea has gone forth that the mines about Mineral Park, Stockton Hill, Cerbat and Chloride have been dug out, and the district has received derogatory mention at the hands of parties who know little or nothing that constitutes the signs of promising prospects. Some few sturdy miners have stood by their properties and have steadily worked ahead, while from time to time new discoveries have been made. At the present time no district in the county can make a better showing, and the recent "strikes" made are astonishingly rich.—Mojave Miner (A. T.)

A MILE above where the Bruneau enters the Snake river an immense dam has been constructed and work is being prosecuted on a great canal, which will turn the water on to the Snake river plains below and reclaim about 25,000 acres of rich land now arid. The water from the canal will also be employed to work thousands of acres of rich placer grounds along Snake river. The completion of this canal, the settling up of these rich lands and the working of the placers, known to be rich, will add greatly to the material prosperity of Owyhee county, Idaho.

THE Marysville *Democrat* says: Thomas Casey, Councilman Kelly and Mark Eckart, who recently returned from Eureka and Bowman's Dam, Nevada county, tell of a valuable quartz lode recently developed at the south side of the dam. The lode is claimed by Gen. A. M. Dobbie, resident agent of the North Bloomfield Company, who has resided at the dam during the past two summers. He calls it the Jeffersonian mine and intends erecting a mill next season, operating it with power furnished by electricity. There is plenty of water power and all the pressure necessary to furnish any quantity of electricity, within a few yards of the mine.

Personal.

SAM CURTIS, the well-known Comstock superintendent, has been examining some of the mining properties near Sutter Creek, Amador Co.

P. DEIDESHEIMER has been up at Sierra City, negotiating the sale of the Oxford mining property.

MR. W. C. RALSTON, secretary of the California Miners' Association, has gone to Baker City, Oregon.

MR. W. L. WATTS, field assistant of the State Mining Bureau, has gone to Los Angeles to study up the oil fields there and on adjacent areas.

Largest Air Compressing Plant.

(Continued from page 225.)

holes in them through which small bolts pass. The duty of these bolts is to keep the rings from moving outward too far.

When the piston starts on its forward stroke to the left, in the direction of the arrows, the rings, not being a part of the piston, tend to keep the position they were in when the piston started. As a result the ring *I* is forced to its seat and the ring *H* from its seat by the forward motion of the piston. When the piston reverses at the end of its stroke the tendency of the rings is to keep up their motion to the left, but the piston, moving to the right, forces the ring *H* to its seat, and *I* away from its seat. The two rings form the inlet valves. If the piston is moved to the left the ring *H* will be in the position indicated. The advancing piston leaves a partial vacuum behind it, and the free air rushes in through the hollow rod and piston into the cylinder, following the direction of the arrows. When the piston movement is reversed, the same thing takes place except that the free air enters the cylinder through the ring *I* instead of *H*. As air has weight, it possesses the property of inertia common to all ponderous substances, and therefore when started in the direction of the arrows, its own inertia keeps it moving in the same direction while the valve *H* is closing and *I* opening. This causes a continuous current of air to flow in *one* direction instead of two (right and left alternately).

The compressed air is conveyed into the receiver at one end, and is conducted from the opposite end through a fourteen-inch pipe to an air shaft 800 feet distant, down which it is conveyed 200 feet to the underground workings. The course of the pipe is clearly shown on the plan designated Fig. 4, which is drawn to a scale of 600 feet per inch. From the foot of the air shaft, the pipe line exteuds nearly straight ahead about 1450 feet to a point where it is divided into two lines.

The descriptive matter is from the *Colliery Engineer*. For the illustrations we are indebted to the Parke & Lacy Co., who are the agents on this coast for the Ingersoll-Sergeant Co.

"MY SON, observe the postage stamp. Its usefulness depends upon its ability to stick to one thing until it gets there."—Boston Evening Gazette.

The Uses of Aluminum.

The uses to which aluminum has so far been put in the arts may be divided into two general classes; one for the fabrication into articles generally classed as "fancy goods," and the other for more staple articles.

The selling price of aluminum was so high (above $16 per pound) up to the first of the '80s, that the metal received very few uses except for expensive philosophical instruments and other such purposes, where the weight of metal used was trifling and the work upon it of very much larger value than the amount of aluminum used.

The cheapening of the process of manufacture of metallic sodium (by the aid of which all the aluminum produced on a commercial scale up to the year 1888 was made), gradually lowered the price of aluminum, until it was selling in 1886 at about $8 per pound. The works of the Societe d'Anouyme d'Aluminium at Salindres, France, which produced the largest amount of pure aluminum, had by that time been enlarged and systematized to such a meritorious extent as to make a very profitable business for the owners.

The use of aluminum in the arts was further encouraged in the years 1887 and 1888 by the investment of large capital in the sodium process of manufacture of the metal by the Alliance Aluminium Co., at Newcastle-on-Tyne, and the Aluminium Company, Limited, at Oldbury, near Birmingham, both in England.

Unfortunately for these concerns, as well as for the older French manufacturers, the new electrolytic method of manufacture of aluminum soon eclipsed the older method of manufacture by the use of metallic sodium as a reducing agent, and aluminum was sold in the latter part of the year 1888 and the first of the year 1889 at the rate of one pound sterling per pound avoirdupois, although the first metal sold by the Pittsburg Reduction Company in 1888 was sold at the rate of $8 per pound. In 1889 the rate for aluminum was further reduced to $4 per pound, and new uses for the metal were brought out, to replace brass, German silver and nickel work in fancy goods articles.

The Scovill Manufacturing Company of Waterbury, Conn., was one of the first and largest concerns to undertake this new development of the use of aluminum. They are to-day one of the largest and most important concerns in this country in the production of stamped and spun articles made from aluminum.

The uses of aluminum up to 1890 were almost altogether confined to what might be classed as strictly fancy goods articles made of the metal. With the

lowered rates of $2 per pound, and later $1.50 per pound, during 1890 and 1891, very considerable uses for aluminum begun to be found.

As the lowered selling price of aluminum had thus far been almost entirely put forward by American manufacturers of the metal, so also the first development of the use of aluminum in the more practical and staple articles was in America; but soon, the foreign manufacturers, keeping pace with the lowered selling prices of aluminum in America, became very much interested in the use of the metal. However, with the middle of the year 1890 and the first of the year 1891, may be fairly attributed the start of the staple uses of aluminum in the arts. By the middle of the year 1891 and the first of the year 1892, the German government became interested in the use of aluminum for military equipments, and the large continental steel works begun to adopt the systematic use of aluminum for increasing the soundness of their steel when cast into ingots or castings. It may be fairly admitted that within the past two years the Germans have outstripped the Americans in the adoption and use of aluminum for staple articles. They have, as well, commenced to manufacture almost countless articles of fancy goods of aluminum. The American public was first apprised of this in a large way at the time of the World's Fair, when there was a considerable exhibit of German articles of aluminum. In this country, the progress of the more staple uses of the metal has been slower than in Europe, but progress is now being made in this direction quite rapidly. Most of the large steel works of the country have adopted the regular use of aluminum in the manufacture of steel, and companies making steel castings are almost universally using it in considerable amounts in their manufacture of these castings.

The Army and Navy Departments of the Government of the United States have not been as rapid in their adoption of the use of aluminum for military and naval equipments as abroad, and yet considerable progress has already been made, and more rapid progress can be looked forward to in the near future. Already considerable orders have been received from the various Government departments by the aluminum manufacturers; and with the recent advent upon the market of hardened "nickel-aluminum" alloys (which show a tensile strength in casting of 25,000 to 30,000 pounds per square inch, and in rolled bars and plates of 45,000 to 50,000 pounds per square inch), many added uses for the metal are being adopted.

The next two years will undoubtedly show a more rapid development of the more staple uses of aluminum in the arts in the United States than the whole progress so far made.—Mr. Alfred E. Hunt, in The Aluminum World.

Boy Stomach Power.

A boy eats two ounces of ice. Let us see, says the *Engineer*, what is the approximately thermodynamic equivalent of the work he has made his interior do, assuming he takes five minutes to eat it. In melting the ice, taking the latent heat of fusion at 143 units, and the specific heat the same for the coloring and sweeting admixture as for the ice, he will require eighteen units to reduce the ice to water. To raise it in temperature to that of his inside, he will require seven more units, or a total of twenty-five British thermal units. Taking the mechanical equivalent as 777 foot-pounds, this will be equal to 19,425 foot-pounds. If the by weighs 100 pounds, he will have called upon his stomach to do as much heat work as would, with a machine having unit efficiency, raise him 194 feet high, or a rate of heat extraction equal to nearly an eighth of a horse power.

DEPARTMENT OFFICIALS of the Ordnance Bureau are giving attention to the possibilities of aluminum. This metal promises to be one of the most important materials in the equipment of modern arms. Already the German armies, which are among the first to accept improvements, have adopted aluminum for a variety of uses, while the War Department is in a measure following the lead of the uavy in giviug attention to the new metal. It is in the liue of small equipments that the army is expected to utilize the metal. Samples are in the Ordnance Bureau of aluminum cups, belt buckles, hooks and horseshoes.

The lessening of marching weight is one of the problems which always is before the officers who superintend the matter of equipments. It is hoped that in the near future it will be found practicable to use the light metal, not only for drinking cups and dishes of the soldiers, but for bayonet scabbards and other accoutrements in which strength is not the first requisite.

THE New York *Electric Review* asks that this be believed: When Edward Smith was passing in frout of the headquarters of the N. Y. and N. J. Telephone Company in Smith street, Brooklyn, N. Y., last Saturday night, he was stopped by some boys, who asked him to throw a bent wire over the electric light wire, none of them, as they explained, being able to perform the feat. He took the hooked wire in his hand, and at the first trial threw the end over the electric light wire. Then an ambulance took him away to be revived. Edward is now suspicious of all small boys and anything wiry or electrical.

The Genesis of Gold Placers.

NUMBER I.

Written for the MINING AND SCIENTIFIC PRESS by R. L. Dunn, M. E.

Gold placers may be delined as deposits in which the occurrence and distrihution of the gold is the resultant of mechanical forces acting on the gold in its solid form, as distinguished from lode deposits in which the occurrence and distribution of the gold is due to the uction of chemical forces on the gold in either of its other states—liquid or gaseous. So far as our knowledge goes, placers are secondary to lode deposits—that is, formed subsequent to and from them.

The mechanical forces which make placers from the lodes find their resultant expression in the denudation and erosion of the surface of the earth. In operation they are both sub-acrial and sub-aqueous, that is, denudation and crosion occur both ou the land surface under the atmosphere and on the surface under the water of the ocean. The gold placers as commonly understood are exclusively sub-acrial in origin. The exceptions are the auriferous sea beaches and the auriferous conglomerates. The gold in the first of these is readily traceable back to lode sources, from which it is broken out in the progress of sub-acrial crosion. Concerning the conglomerates, which have only recently become important as the source of gold, little is delinitely known. The conclusions of investigators differ materially. By some it is advanced, that so far as the presence of the gold is concerned, the couglomerate is a primary matrix eomparable directly with a lode; that it receives the gold directly by sublimation from the earth's interior. This theory has been made the explanation of the auriferous character of the great Transvaal conglomerate reefs, the greatest gold producers the world has ever known. Another theory is that the conglomerates are formed by the direct ocean erosion of auriferous lodes and their enclosing rocks. In the writer's opinion, however, all of the conglomerates containing gold were once sub-aerial uuconsolidated formations, sometimes, but not essentially always, subjected to sub-aqueous denudation and erosion before becoming cousolidated. That is to say, they were once placers mechanically formed by sub-aerial erosion, secondary and not primary depositaries of gold.

If auriferous lodes be examined the gold will be found disseminated through a matrix or gangue of rock, which is almost invariably quartz. It will be noted that by far the larger number of gold bearing lodes contain the gold in miuute graius, which are more often than otherwise so small as to be invisible to the unassisted eye. Also, that in lodes in which larger pieces of gold occur, the bulk of the gold is still in fine grains, a lode containing only coarse gold being a notable exception. On the other hand, in the aggregate of the gold obtained from placers there is probably more coarse gold than fiue. Placers from which coarse gold only is obtained are commou. So marked frequently is this predominance of the coarse gold from the placers, contrasted with its subordinate occurrence in the lodes of the same locality, that the placer gold would necessarily seem to have come from some other source than the lodes, or if from the lodes, that the eroded portions forming the placers must have been much richer in coarse gold thau the portions in place. Neither of these suppositions is, however, the explanation of the apparantly coutradictory phenomena. The fact is, that the relative magnitudes of the eroded and uneroded portions of the lodes is not appreciated. At the best mining explorations only take in a limited volume of the lode in place, and the possible volume of the eroded portion is not surmised by the miner. This eroded volume is, however, of euormous exteut compared with the volume actually mined in place and in it there is ample space for the occurrence of coarse gold in no greater amount than found in the lode mining to cumulate all the mass found in the placers. At the same time the fine gold from the euormous volume of eroded lode, in aggregate weight several times that of the coarse recovered from the placers, is transported to greater distances, distributed over wider areas and into a many times larger volume of earths and stones than the coarse. Much of it is in ground that a miner would not work, and a still larger portion in deposits in which its existence is not even suspected. It is this disappearing fine gold which is frequently respousible for the incorrect opinions as to the source of the coarse gold.

The sub-aerial agencies of denudation and erosion are temperature, water and the atmosphere, acting individually and in concert. Soluable portions of the rock masses are dissolved out. Chemical changes are effected changing insoluable to soluable portions. Unequal expansion and contraction crack the masses and detach fragments. Water in the rock seams congealing also disintegrates the rock. Inequalities of the surface and differences of elevatiou concentrate the euergy of the water and eroded fragmeuts of the rocks into distinct chanuels. Through these chanels the water falling on the laud as suow or rain is constautly finding its way back to the ocean, carrying with it, either solvent or mechanically, portious of the land surface which is being disintegrated. The entire laud surface is thus unequally, as regards time, beiug cut down to the base level of the ocean. With the general mass of the rock in place the auriferous lodes are disintegrated and worn down toward the ocean base level. First, from the lodes as from the rock masses, unsized and irregular shaped fragments are broken off; then these are carried away by water, thus exposing fresh surfaces of the rock in place, and the fragments by abrasion and weathering become reduced to a more or less pulverent condition. The separation of the gold from its quartz matrix does not take place when broken out of the lode in place, though the separation may be effected long before the quartz is reduced to sand. The breaking up of the quartz fragment naturally follows the lines of structural weakness. These are in the surfaces where the quartz and gold come in contact and on the crystal surfaces and through the crystals themselves of the metallic sulphides frequently so intimately associated with the gold in lode deposits. One or more faces of the gold particle thus become exposed on the surface of the quartz fragment as a result of fracturing on the planes of structural weakness. The malleable tenacious gold resists abrasion better than the more brilliant quartz, so the latter wears away from around the gold till the latter is left in sufficient relief to become readily detached by the abraiding forces. During this period of gradual breaking up of the auriferous quartz fragment it is being moved from its original situs at a rate dependent on a number of variable conditious and circumstances; ultimately it may reach base level in one or the other form of pebble or saud. The gold particle does not necessarily go with it unless, indeed, the particle is so small that the ratio of its surface to its volume is so large that its specific gravity is neutralized and the particle floats with the stream currents. If, however, the gold particle is not this fine it stops moving and settles to rest finally where freed from the quartz. Other conditions being equal, the movement of quartz fragments containing gold is in the ratio of their several specific gravities. As soon as the volume of the fragment becomes sufficiently reduced for the higher specific gravity of the gold to raise appreciably the specific gravity of the fragment composed of both, its onward movement will become retarded, aud that retardatiou, by increasing frictiou, will accelerate the rate of abrasion, and that in turn again the rate of retardation. Naturally fragments containing coarse particles of gold will wear away quicker and the gold reach its stopping place with less distauce of movement than fragmeuts of quartz containing fiue particles of gold. Thus coarse gold is, other thiugs beiug equal, always left in placers uearer its lode source than fine gold. Frequently, indeed, the fine gold is moved to such distances and distributed through such masses of material that its original connection with the coarse gold in the same lode seems hardly conceivable.

Coarse gold, and indeed the larger portion of the fine gold, in any particular deposit, is usually found immediately on or very close to the bedrock. Occasionally there is a placer deposit in which the gold is found in a stratum of the unconsolidated drift above the bedrock, sometimes ouly a few inches, but just as often over a hundred feet. Fine gold, however, is frequently found distributed iudifferently through a very considerable depth of material without any marked conceutratiou being observed in any particular stratum. These pheuomena of distribution come from the nature of stream erosion, which, though ultimately tending to cut the entire basin down to base level, is at any particular point within that basin an alteruation of periods of cutting and periods of accumulation of the eroded and cut out fragments of some other portion of the stream basin of greater elevatiou above base level. As between any two points on the same stream basin, the cutting periods are longest aud the alteruation of periods least frequent on that poiut in the harder rocks, and the accumulation periods are longest and the alternations most frequent at the point in the softer rocks. These differences are more marked the greater the difference iu hardness of the rock and the further the erosiou is from the ultimate base level. During the cutting periods the grade of the stream channels is greatest, and during the accumulating periods it is lowest. The velocity and carrying power of the stream currents are in the ratio of the grades. As a consequence, the auriferous quartz fragmeuts remain much longer under couditious favorable to abrasion in the accumulatiou periods than in the cutting periods, and of necessity much more gold is entirely separated from its quartz fragmeut; also in the portions of the stream longest under the conditions of accumulating periods there is naturally the largest accumulation of gold—more, therefore, on the softer bedrock than ou the harder bedrock.

As a logical inference, the reason of coarse gold concentration on soft bedrock in preference to hard bedrock is not, as commonly asserted by placer miuers, that the soft bedrock presents a more favorable surface for retaining the gold than the hard, but it is because the great mass of the gold became free from its quartz matrix while over the soft bedrock. The gold being left there stays there till it is taken out by mining operations, aud what is left on the

hard hedrock stays equally well there only there is less of it left. The coucentratiou of the gold on the bedrock is caused by the alternation of periods of cutting with periods of accumulation. The cutting during a cutting period first crodes away the mass of drift of the preceding accumulation period or a portion of it, and as this drift is ordinarily an uucousolidated formation, the stream sorts it over, sweeping out the lighter particles and fragments aud leaving the coarser and heavier to either first be broken up further and theu moved ou, or, as is the case with the gold, to just settle down to the surface of the bedrock and remain there while the bedrock is heing cut away. The more freqnent the alternations of periods the more complete this coucentration becomes. In some iustances it is evident that for a uumber of cutting periods, the last to occur preceding the last accumulation period which is the existing condition of the placer, the cuttiug does not extend dowu to the bedrock but stops at a stratum some distance above it aud the gold is coneentrated in this stratum just as if it were the hedrock, forming in fact what is known among placer miners as an upper lead.

All the pheuomena of the concentratiou of gold are identical with the phenomeua of the placer mining method known as ground sluicing. In this miuing a stream of water is rnu on the surface of the gold-hearing earthy or gravelly deposit, and gradually disintegrates it, being assisted iu this hy the miner with tools for looseuing the surface ou which the water is runuing. The lighter earthy and pebbly particles are carried away hy the stream, hut the gold simply settles to the bottom of the ent, from which it can be taken out coucentrated in a much smaller hulk of earth and gravel. It will be noted that the water, if left to itself, does not cut the deposit on a uniform grade, but rather in a series of uearly level steps and sharper inclined rises betweeu. This is due to the unequal hardness of the earthy and gravelly mass. Iu the softer portions the cutting proceeds more rapidly thau in the harder, but is limited in depth by the harder seetion immediately below, aud in backward extent by the harder section immediately above. The soft portiou is thus cut to a level and the water cnt extends sideways to widen it while both above and below the stream is confined to a narrow cut on a steep grade. On a tremeudous scale this is the identical process of nature making the channel basins of the rivers. In the softer rock sections the stream cuts its bed down to a hase level limited by the slower cutting iu the harder rock section helow and limited up stream by the harder rock seetion there. Once cut back to this harder rock section, the flat portiou now enters on an accumulation period, during which the softer rock becomes eovered with drift, auriferous or uot, as the case may he, till the stream approximates to its maximum possihle grade in this section. During this accumulation period the stream spreads itself over the wider surface of the accumulated drift, but finally as it reaches its maximum grade it again concentrates itself into a single channel not necessarily identical in situs with the former one and enters ou auother cuttiug period.

The enormous intervals of time covered by the periods of cutting aud accnmulation during which the gold has heeu broken out of its primary lode situs and accumulated iu the placers is with difficulty comprehended. But its possihilities aud signifieauce once grasped, the existiug conditions of distrihution are conceivahle without the intervention of extraordiuary activities in uatural forces at some preceding period or the existeuce of richer lode deposits. The fact is that the existiug couditions of placer gold occurrence and distrihution ean readily he, and in the writer's opiuion, in fact are, the accumulatiou of the natural ageneies acting with no more intensity than at the present time ou lode deposits that were of no greater richness than those uow heing mined.

Most placer deposits, in the hroadest sense all, are the resultant of the accumulatiou periods, not of one channel of the same stream, hut of several channels of portions of it. Bars, benches and flats are, iu fact, nothiug but sectious of old stream ehanuel with more or less of the drift of the last accumulatiou period in place. In the surface of the bedrock underneath the unconsolidated drift can be found all the evidences of the direct erosion of a stream channel. These old channels abandoned by the stream at the close of au accumulation period escape suhsequent erosion by it by reason of the stream having made its new channel on one or the other side of the old one. The several channels of the same portion of a stream are not usually found equally auriferous, though to all appearauces equally developed as chaunels in the same rock and filled with identical drift, at least in geueral appearauce. As a general proposition the older the channel the richer in gold, uot because of its age, hut hecause the chanuel was the result of an erosion extending over the longest period of time, and was the result of the concentration of the largest mass of auriferous lode deposits. Just which of several channels is the oldest, or rather which oue was the concentration of the largest volume of auriferous lodes is not always superficially determiuable. It may or may not he the channel of the existing stream flow. For definite determinatiou only a certain amount of miuing is conclusive. Hamburg bar on the Klamath river is a striking example of two channels cut by the same stream, one rich in gold and the other containing little or none. The bar is nothing but the old channel of the Klamath river filled up and superficially ohliterated by an enormous slide (one of the characteristic phenomena of sub-aerial erosiou and denudation) for three-quarters of a mile. The existing river chaunel is alongside of the old one, approximately parallel and ouly a few hundred feet distant. The beds of both chauels have ahout the same level. The preseut chauel has beeu found to eontain very little gold, uot sufficient to justify mining, though ahove aud helow the har it has been profitahly mined. The old channel under the slide has all beeu mined aud fonnd to be as rich as the existing river hed ahove aud helow. The miners would say that the pay lead ran under the bar in the old channel, and they somehow connected the phenomena with a veritable flow of gold in the stream, saying that since the formation of the new channel there had heen no flow of gold in the river. The true explanation of the difference of gold content hetween the channels is in the fact that the new channel has oecupied bnt a fraction of the amount of time iu its formation that was occupied in the formation of the old channel, aud the volume of auriferons lodes eroded during the formation of the new channel is an insignificant fraetion of the volnme eroded during the time of formation of the old chaunel.

(To be Continued.)

California's Greatest Resource.

To the Editor:—I have for a loug time advocated increased energy in the mining interests of our State, and while so doing I am ofteu told hy the persons I speak to that they are afraid to risk their money in prospecting for, or tryiug to develop, paying mines; that it is an extra hazardous husiness. They pretend to have faith in agriculture, fruit-raising and other euterprises of that kind; yet they admit that, owing to the lack of demand aud the low prices, it is almost impossihle to make a liviug at any of these pursuits. House-buildiug and the lumher husiness is no better, nor is there auy industry that offers as fair a reward for the risk of capital as is done by mining. I firmly helieve that quartz-mining, coudncted on sensihle and economic priuciples, on veins that show gold and have indieations of valne, is less uncertain and much more likely to yield a profit to those engaged in it than any other enterprise that can at this time be suggested—in faet, it is the only resource left hy which the prosperity of the State can he revived. There are mauy quartz mines now heiug ruu at a profit in this State. Only a few of them are ever reported—three only were reported last month as dividend-paying—yet we know there were mauy more; many of them private corporations, who work ou aud on, year after year, and say nothing. This is not fair to onr State. We see grand reports from South Afriea, Australia and other parts afar off, while, with a little more euergy on our part, we could match our California mines against anything these places have to show.

If the papers published near the several miuiug camps of this State would seud you a list of the mines in their localities that are paying a profit, or of those that are being developed hy the proceeds of the mine; also of those which are being worked contiuuously and of which not mueh is known; and the number of people who are making a living directly from gold mining, without counting those in this or other bay cities, it would show our citizeus what is being done in the way of miniug in this State aud would give them eourage to invest in an enterprise that has a favorahle show for success. If the farmer finds the soil, climate and other conditions favorable for agriculture, he is willing to purchase laud and engage in farming, knowing from experience that the indications are all right. So it is in mining. If the ledges are strong, well definecl, show gold, and are in a mining region favorably situated for the working and reduction of ores, the miner knows that the indications are all right and that there will he hut slight risk to he takeu. If persons who engage in mining will be tolerably certain that they have a mine and will stiek to it, working skillfully and with economy, they will be as successful. iu as great a number of cases, as the farmers or those in any other industrial enterprise, and will have the advantage that there has heen no recent overproduction and that the product of a gold miue still sells at par. Yours truly,

San Francisco, Oct. 3, 1894. Boreas.

Will Purchase the Mine.

The directors of the Granite Hill Mining and Development Compauy held a meeting a few days ago and decided to purchase the property which they now have houded. The purchase price is $15,000, of which $1500 has already beeu paid. The original owners of the claim are Martin Ford, Mrs. Johu Ford and quite a numher of small shareholders. The mine is looking well and with proper development will douhtless prove a paying property. The company has until November 10th in which to pay over the moucy.—Nevada City Herald.

The Black Sand Gold Question.

To the Editor:—My attention laterally has been recalled to the hlack sand gold question hy an interesting artiele written hy Mr. E. W. Keeler of this eity and puhlished in the *Bulletin* under the heading of "Seashore Gold." Mr. K. says:

> The great difficulty that for years has met every prospector for gold in these black sand deposits that constantly follow the line of tidal upheaval, is the fact that magnetic iron as fine as the grains of gold, and of nearly the same gravity, are found side by side, with a great preponderance of the iron. In some localities there is found in sand twenty-five to forty per cent of pure magnetic iron that is capable of making a quantity of metal equal to the finest imported Swedish. In all ordinary methods of separation this iron is so fine that it is in the way, and interferes with any system of reaching and reclaiming an equally fine particle of gold.

As I see things, the matter of seeuring "the equally fiue particles of gold" is less a task than to find a paying value of this fine leaf gold, and yet I am a believer in the possibility of this. Mr. K. says further:

> In my washing of sand from the vicinity of Gray's Harbor I found at least thirty per cent was of fine magnetic ore. A fire assay of this ore showed a value of $26 of gold per ton.

This $26 per ton simply shows that it is possihle to find rich spots, as in all other classes of mining. A practical paying average would be way below this amount.

That there is, or will be, a commercial value iu this black saud, or rather magnetic iron, seems reasonahle, in the face of such cheap facilities for separating, aud especially where transportation is cheap. Because it has not heen utilized as a profitable venture is uo sign it will not he, in these chauging times of reduced prices on everything, along with improved facilities for separatiug. On the matter of reducing and valne of their iron Mr. K. says:

> I visited the only one in this country, which had been reconstructed in order to utilize these fine magnetic ores, and some 700 tons of the magnetic ore from the black sands, such as I experimented with, was being used. The muck bar iron was so superior that at that time it secured purchasers at $15 per ton over the ordinary.

On this hlack saud gold question, ten years ago I spent a great deal of time and some coin in investigating the whole matter, and published several articles in the Press on the suhject, hnt heing more actively engaged in quartz mining, and there being no especial attention given to the iudustry further thau the old "eatch as you can" plan, I dropped the matter. At the same time I never lost sight of the practical facts. Mr. K. in his article treats simply of the occan beach sands, while my experiments and results exteud through the whole "hlack sand" question as connected with hydraulic, drift, river and placer mining, as well as the sands of the ocean beach.

That the black sand gold indnstry can be made a very important one for the whole Pacifie coast I am well satisfied, if taken hold of and haudled intelligently in a commou-sense, economical and husiness way.

It could, iu my opinion, be put on such a hasis as to give employment for all the surplus lahor of the coast. As to the value of the black sand in a commercial sense, I know hut little. I deal only with the gold question, leaving the hlack sand as a hy-product. As hefore stated, my investigations and experiments were made ten years ago. During the interim I have learned something, and look upon the assertion of its being so difficnlt to save the fine gold associated with these sands as no difficulty whatever. The difficulty, in my mind, is in a plan of cheap separation, for with cheap separation it would hring forth, as stated above, an industry that could employ a vast army of lahorers. Labor is the main factor after having a reasonably paying deposit. The great rednetion in all that pertains to living and lahor in the past ten years adds a greater chance for a profitahle outcome. On the question of profit in the iron sand, that is only a question as far as time is concerned. What is uot valuable to-day may he of great value in a few years wheu cheaper rates and hetter facilities of transportatiou are secured. That avenues will soon open for utilizing the hlack sands seems prohahle in this advancing age. The iron question applies more direetly to the oeean heach sands, as there the accumulation would be greater, and yet in our hydraulic, drift and placer diggings more or less tons can at all times he secured.

Why the hydraulic, drift and placer miners of this State have not paid more attention to the gathering of the "hlack sand" (magnetic iron, etc., all going and practically understood under the head of "black sand") and gold, has always heen a query to me. At a drift miue I once visited, it did not take long to see that a great valne was in their hlack sands, as there was more or less of what they considered "black sand," really gold coated with iron, and looked to the general eye as iron. I selected one special piece and asked the superintendent what he thought it was—iron or gold? He said, off-hauded, that it was iron. I then requested that he look on the opposite side; I had scraped the iron coating off on this side, and he was astonished to see that it was gold. By permissiou, I went to the end of the sluice aud panned

out three pansful of the material, and from the concentrated "black sand" I obtained $7.35 in gold. I then sought to secure the several thousand tons of tailings, but no; they intended to resluice them in the ordinary rough way, and for every dollar they received there were at least $10 washed off, and so it has been for years. We used to wash our sulphurets away in quartz milling, but we have learned better since; and so it will be as regards this black sand in hydraulic and drift mining especially. I can only account for the reckless washing away of these sands for two reasons: First, unbelief as to their value; and second, that if they believe there is a value, then it must be laziness. Hydraulic, drift and placer miners must get over the idea that nothing has a value but bright, free gold. I will also add that there is a great deal of gold otherwise coated which mercury cannot gather, all of which goes into the tailings.

By the way of causing investigation as to what additional value can be obtained from these sands, I will here append the tests made ten years ago. As nothing has a value unless it costs something, I will here state that my curiosity as to values and the working for the cause, is fully satisfied. It should be understood that every miner who produces $2 or more of gold gives, on the average, a day's work to some one who needs it.

TESTS OF HYDRAULIC, DRIFT, RIVER AND OCEAN-BEACH SANDS.

Hydraulic.	Drift.	River.	Ocean beach.
$852 20	$ 60 00	$10 00	$9 32
80 00	15 80	27 90	2 10
347 00	65 50	15 40	3 50
28 75	271 80	17 78	18 50
168 00			18 00
12 00	Average, $103 25	Average, $14 21	2 30
175 00			1 35
51 00			80
221 80			4 20
210 00			1 75
90 00			
140 00			Average, $6 82
98 00			

$152 05 Average.

The large values in hydraulic mining tests can only be accounted for on the ground that the working is all coarse—on the rush—consequently what iron-coated gold there may be is in coarse pieces. The finer the work the more iron and the less value per ton; at the same time more gold as a total in a clean-up of the whole.

In winter time when hundreds of men are clamoring for food, I have often thought of the possibility, with a small outlay for putting up suitable machinery, how every idle man could earn his daily bread. From the Cliff House for five miles down the coast this black sand carries gold, concentrated. I have had as high as $18.50 in value and as low as $1.35 per ton. Taking the general average, it is simply a bread-and-butter proposition, yet that is better than begging.

Thus we may say "the golden shores of California" is no poetic phrase, but a reality, as where beach sands are, the color of gold can be found along the entire coast.

In quartz mining we are getting things down to a very fine per cent in saving the values. Why not get the full values from our hydraulic and drift and other mines? ALMARIN B. PAUL.

Room 5, Crocker B'ld'g, S. F., Oct. 10, 1894.

Mining Operations in Alaska.

The Alaska *Mining Record* says:

The backward spring and ceaseless downpour of rain this summer has deterred the prospector in his search for new discoveries and greatly retarded mining operations generally. Last winter's snowfall, its tardy disappearance this spring and the amount of rain that has fallen this summer are unprecedented within the time of our oldest residents. Prospectors have been unable to get out; or, having made a start, have been unable to get into the hills in the face of the snow and the elements to do any prospecting, and consequently this season has nearly rolled away without any important discoveries having been made, and in comparison with past seasons but few new locations have been recorded. And, too, the low and uncertain price of silver has caused several promising silver discoveries to lie idle which would otherwise have received a fair amount of development work and shipments of ore made to the smelters below. But, notwithstanding the unfavorable elements, a number of companies and individual owners have pushed work as rapidly as possible, and by the close of the season a good showing will have been made. Notable among the improvements during this season and the steady operation of mines and plants are the completion and steady operation of the Mexican sixty-stamp mill; new and extensive improvements at the Treadwell mill and mine; the completion and operation of the Berner's Bay Mining & Milling Co.'s stamp mill and tramway; the steady operation of the Silver Bow Basin Mining Co.'s hydraulic plant in Silver Bow Basin; the completion of this company's stamp mill and the tramway to the Ground Hog mine; improvements and steady operation of the mill at Arehie Campbell's mine; the lease of the Bennett mine and its operation; the operation of the Takou Consolidated mill; the lease and operation of the Silver Queen mine and mill at Sheep creek, and the sale and operation of the Bald Eagle mine at Sum Dum. Other sales and negotiations are now pending on various properties, some of which will take definite shape before spring, and new enterprises will come into the field; and together with the old ones, the season of 1895 will open out with an unusual amount of work and activity.

The Pelton Water Wheel.

The Pelton Water Wheel Company of this city has issued a handsome new catalogue descriptive of the Pelton water wheel, and embracing in its variations of construction and application the Pelton system of power. The system presented, as is well known, offers so many advantages for the general utilization of water power, that streams favorably situated for power purposes are now eagerly sought for and appropriated. By its use the entire force or highest head obtainable can be made available for all industrial purposes with a greatly reduced cost, wider range of application, and fuller adaptation to varying requirements, than has ever before been realized. Nothing in a mechanical way has so signally and quickly demonstrated its own usefulness as well as its right to the first place in hydraulic power appliances. The transmission of power by electricity has opened up a new field and a wider range for the utilization of such sources of power, than has been possible by any previous methods, and the field is continually enlarging as the science advances. There is a large amount of useful information on this subject in the catalogue, and it is so arranged as to be very readable and interesting.

The new catalogue is finely illustrated and contains much information to users of water power. The literature pertaining to modern hydraulic methods as embraced in the Pelton system is quite meager, but an endeavor has been made in this edition of the catalogue to supply in some measure such information—both practical and technical—as will admit of an intelligent estimate of the principles involved in what is now generally conceded to be the most distinctively new and important development in hydraulics that has been made in this century.

The Pelton wheels are now in use all over the world. The invention is one of the most important ever made on the Pacific coast, and its merits are now everywhere recognized. Peltou wheels are now running, almost without exception, every electric station in this country where conditions favor as to head, and in every instance they have been a most pronounced success, making profitable many enterprises that could not be run by steam power without loss. Every plant of this character, so far as is known, has been a good investment, while many may be referred to that have paid from thirty to fifty per cent per annum on the entire outlay. For mining and milling work nothing has ever excelled them. The descriptive pamphlet will be found useful to all miners, mechanical engineers and others likely to be interested in the utilization of water power.

New Chlorination Works.

Messrs. Miller and Beaulieu, general contractors for quartz mills and chlorination works, have just completed at the Rawhide mine for Messrs. Nevils and company a fine, substantial and unique three-ton capacity chlorination works. We examined them recently and greatly admired the workmanship, close application of recent practical science and suggestive mechanical skill. The building proper is 156 feet long by 40 feet wide. The furnace consists of a smokestack 40 feet high and 5½ feet at the base, and of a brick and iron structure 80 feet long and 11 feet wide containing the furnace proper and sulphurets reception department. The floor at both ends of the furnace structure is made of concrete material well and deeply laid. The inside of said furnace structure is lined with the best of English fire-clay, laid with reference to the conservation of the heat forces. On all sides of the brickwork are broad vertical staves of iron two feet apart, sunk deep into the concrete base. They are drawn tight at the top by buck-rods. In fact the top of the brickwork is lined and cross-lined with great rods and bolts of iron. The floors from the discharge end of the furnace are graduated so that the oxidized material may pass easily and at once into the slack tubs and leaching vats. All the angles and top lines of the brickwork are effectually protected with angle iron. Messrs. Miller and Beaulieu built the entire outfit in six weeks from the day of commencement, and competent experts say that the design and execution are remarkable for completeness, for elaborate details, and that they are superior to the famous Augel's Camp chlorination works.—Sonora (Tuolumne Co.) Democrat.

A recent fresh-meat cargo from Australia and New Zealand consisted of 70,000 carcasses of sheep, 9000 haunches of beef, 150 bags of bullocks' hearts, 550 tons of beef, 550 legs of mutton, 150 bags of ox-tails and kidneys, 7 cases of oysters and 750 cases of butter.

There has not been a total eclipse of the sun in London since 1715, and Prof. Holden says there will not be another until after the opening of the twenty-first century.

The Late James H. Crossman.

James H. Crossman, who in a fit of despondency committed suicide in this city last week, was known to a great many readers of the PRESS through his frequent contributions to its columns a few years ago. He was one of the pioneer mining men of California, who had been connected with all its old-time "excitements," and visited most of the camps on the coast. Like all of this class, he had Fortune within his grasp many times; but he died without any estate. In Nevada, "Jim" Crossman was particularly well known and it was there he acquired the sobriquet of "East Ledge Crossman," owing to his enthusiasm and persistence with relation to a great east ledge of the Comstock. Of late years he had confined his operations mainly to San Bernardino county, where he was identified with the Temescal tin mines and the Gabilan gold mines. He made some $10,000 in one of his speculations there a few years since, and this was his last "stake."

Although he was a frequent contributor to the newspapers on mining topics and had considerable experience as a practical miner, he was not an educated engineer. Nevertheless, for a long time he has figured as an "expert," and reported more or less on mining properties. Like most of the old-time miners he was of sanguine temperament and apt to greatly exaggerate the possibilities of profit.

He had a great many peculiar theories about geological formations, etc., but very little real knowledge of the science of geology, for he was never a student, but "picked up" what he knew on the subject and was apt to be very certain that he was right. He was a very much better mining superintendent than mining engineer.

While returning from an examination of a mine near French Gulch, Shasta county, about a year and a half ago, he was badly injured by an accident with a team on the grade, and was confined to his room for many months. It is only a short time since he was enabled to abandon his crutches, and has not been in a position to do any active work since the accident.

"Jim" Crossman, as he was generally known, was a genial, free-handed man, and made many friends in all the mining camps in the Pacific coast. He had wide experience as a miner, but it cannot be said that his reports on properties carried any great weight, which was largely owing, no doubt, to his very sanguine disposition. His knowledge was of a practical character, however, but more of the kind adapted to every-day work than that required to judge of the prospective value of a mine.

The Lesson of a Naval Battle.

The great naval battle at the mouth of the Yalu river threatens to revolutionize naval architecture. While some of those connected with the construction of our own naval vessels are still holding out for armor-clad leviathans and poon-poohing the idea that a navy can be worth anything whose strength is not based on these monsters, some of the most distinguished authorities in this country and very many abroad are earnest in their advocacy of swift cruisers. Many of them had favored cruisers rather than immense armor-clad ships before the Yalu battle, and the results of that fight confirmed their judgment. Several of the most famous naval experts in Germany and Great Britain are communicating their views to the press on the same subject, and maintaining the same opinions.

They claim that in building immense armor-clad battleships speed must be sacrificed to the defensive features, and that it was demonstrated in the battle between the Japanese and the Chinese that speed is indispensable. The Chinese ships were fought with great bravery, but the smaller and swifter ships of the Japanese had them at a disadvantage. They were able to shift their positions in much shorter time and strike their opponents without exposing themselves, and they could get out of the way so much more readily that practically the fight was one-sided. These are the deductions from the meager reports thus far received of the engagement, and they will probably be confirmed by later particulars. The Japs are quicker and more eager fighters and more intelligent, but they were materially aided by the superior speed of their vessels, which enabled them to outmaneuver the Chinese at every point.

Another very important naval deduction is made from the war as far as it has progressed, and that is the tremendous significance of sea power in waging war, says the Baltimore *American*. The Japs, owing to the superiority of their navy, or, to speak more correctly, the superior use they have made of it, have been able to land troops in Corea at any point with impunity, whereas, had the Chinese navy been put to a proper use, or had it been superior, very few troops could have been landed in Corea, and the Chinese would not now be quaking in their boots for fear that their capital will be taken and the Government overthrown. This feature of the war is being earnestly discussed in the foreign papers, and the suggestion made that more consideration be given in future to sea power. The suggestion is as applicable here as in Europe.—Chicago Journal.

Scientific Progress.

Pumping Wind Into the Earth.

What is known as the Heckert-Rowland plan for generating natural gas in the bowels of the earth is about to be given a practical demonstration in Findlay, O. The necessary pumps and engines are now being erected on the site of the old Wetherald rolling mills in the northeastern part of the city. This is in the vicinity of several abandoned gas wells, which will be utilized for conducting the experiments. The theory, which was evolved by William Heckert, a well known mechanical engineer, at present a member of the Findlay City Council, will work a revolution in the natural gas region if it proves practical.

Heckert proposes, by means of powerful pumps, to force air down into the gas-bearing rocks, which it will permeate, and thereby become infused with the active properties of the gas itself. It is contended that, as now burned for fuel, the natural gas requires an admixture of nine parts of air to one part of gas, and that this mixing can as well be done in the earth as in the stove or in the furnace where it is burned. The great trouble in the gas region is not so much the decrease in the volume of gas as the decrease in the pressure. This has fallen off, in a large portion of the Ohio field, from 400 pounds, at which it started, to 40 and 80 pounds, and this is found to be insufficient to convey the gas from the wells through the system of pipes to the point of consumption. The friction takes up all the initial pressure.

By Heckert's process this lost pressure will be re-established. His air pumps, constantly at work, will force enough air down one hole to create a pressure sufficient to force the remaining gas, mixed with the air, out of several other holes, and gives it a strong initial pressure in the pipes. The gas thus formed, or charged with air, will be ready for burning with little additional mixture of air at the point of combustion. It is also claimed by Heckert that air thus pumped down into the rock, and passing over and through the pools of oil which are now almost universal in the Trenton rock in this section, will take up the volatile gas of the oil and force it up the convenient wells ready for use.

Inside of a month or two the preparations for the trial of this important theory will be made.

A World-Circuit Telegram.

One day last April a telegram was put into the hands of the courteous chief engineer of the British postal service, Mr. W. H. Preece, with the request that he would say whether it could be sent around the world by a certain route, and if so, what time it would take and what it would cost per word. When the person who made this inquiry went a few days later to look after the progress of the telegram, Mr. Preece shook his head. "The whole foreign department are at it," he said, "and they are tearing their hair and protesting, but you shall have it soon." The route planned was rather erratic. It asked that the message be sent by a circuit which would take in the entire telegraphic field of the world, touching at the most remote points, but never leaving the land line or the cable; that is, never being transferred by post or messenger from one point to another. Starting at San Francisco, the route ran across the continent to New York by Vancouver and Moutreal. From New York it followed the world's northern telegraphic boundaries through England, Norway, Sweden, Russia and Siberia. Going south, it touched at Nagasaki in Japan, Hongkong in China, Singapore, Java and Sumatra, crossed Australia and landed in New Zealand. Returning to Singapore it crossed to Bombay, made a detour to Ceylon, then on to Aden, rounded the Cape of Good Hope, leaving the line at Zanzibar to call at Seychelles and Mauritius, mounted the west African coast to St. Louis in Senegal, crossed the south Atlantic to Permambuco, traversed South America from Buenos Ayres to Valparaiso, and then went north through Mexico to New York. In a few days, true to his promise, Mr. Preece had the answer ready. The telegram could be sent. It would require about fifty-six hours, and would cost about ninety francs ($18) per word.—World's Progress.

A Faded Signature Brought to Light by the Camera.

An instance of the use of photography in important legal matters is given, says the *World's Progress*, in what is known as the famous Stubblefield-Munford controversy. It involved the ownership of 1500 acres of valuable land in Fayette county, Ohio. During Monroe's administration this tract was willed by one of the old Munfords to his five heirs, and the present suit was brought on the deed of sale signed by them. The Munford heirs deeded the land to Stubblefield, who afterward sold parts of it to different parties, who had to pay twice for their land. The deed of sale, discolored and yellow with age, showed only four signatures and a space for a fifth, and the closest scrutiny could not discover the fifth. On this signature turned the question at issue. It was finally decided to photograph the signatures and see if the course would disclose the fifth name. This was done under the direction of the court by a photographic expert named Spencer, and under the closest watch of the clerk of the court, who could not allow the original to leave his hands. On the plate he saw traces of the signature, and, on enlarging the negative ten times, the entire name was as plainly seen as when written.—Bostou Journal of Commerce.

Easy Climbing at Night.

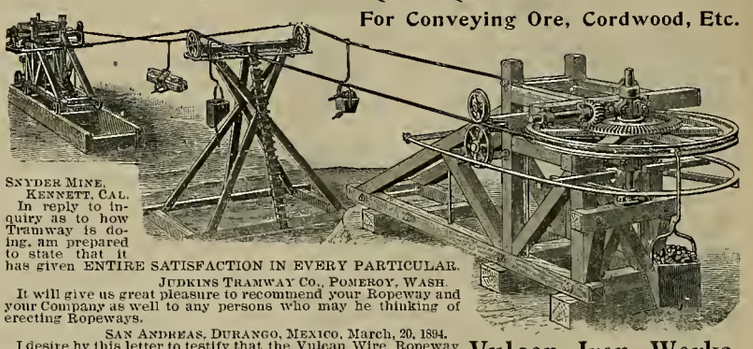
Many bicycle riders have woudered why hills are much easier to ascend in the dark than in the daylight. The simple explanation of this curious fact, as given in the *Bi-News*, is that "what the eye does not see the heart does not grieve over. The brain waste does not go on so rapidly when the eye sees little or nothing to waste it, by worrying about what has to be done before the steep is conquered." The writer adds that if a rider will select a hill just beyond his powers and "have a shot at it when he can see only a yard or two before him," he will find that he can surmount it with ease.

A NEW EXPLOSIVE, manufactured by the government of Great Britain, has lately drawn much attention. It is called "cordite," and is an invention of Prof. Abel. It is in the main a similar product to the smokeless powders of other nations. The name "cordite" originates in the process of manufacture, during which the gun cotton, after being combined with a sort of explosive gelatine, is pressed through a plate with fine openings, thus receiving the shape of fine threads. The object of this process is that by proper selection of the thickness of the threads it offers great latitude in the control of the swiftness of the explosion, which is in other powders attained by the finer or coarser grain of the particles. One can, therefore, according to requirements, manufacture a quickly combustible explosive for mining purposes, or a slowly burning, driving power for projectiles. Cordite can be plated into cords, which naturally increases its availability for practical use. The judicial side of the cordite manufacture offers special interest, as the well-knowu firm of Alfred Noble—the inventor of dynamite—had instituted a lawsuit against the English Government for infringement of its patent rights. But although the modern manufacture of explosives rests mainly on Mr. Noble's efforts, the firm lost its suit because the fundamentary patents had expired.

Stamp Mills!

VULCAN WIRE ROPEWAY

For Conveying Ore, Cordwood, Etc.



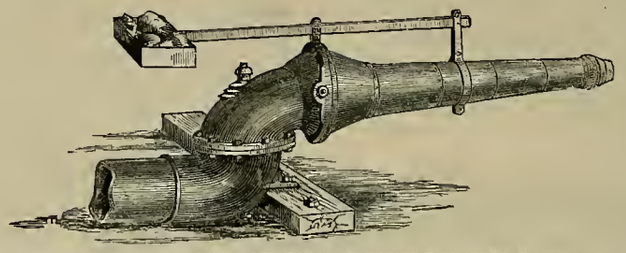
SNYDER MINE, KENNETT, CAL. In reply to inquiry as to how Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR.

JUDKINS TRAMWAY CO., POMEROY, WASH. It will give us great pleasure to recommend your Ropeway and your Company as well to any persons who may be thinking of erecting Ropeways.

SAN ANDREAS, DURANGO, MEXICO, March, 20, 1894. I desire by this letter to testify that the Vulcan Wire Ropeway furnished to this Company by your Works, and erected by your engineer, B. McIntire, is of the very best class, and has given us entire satisfaction since its installation. ANTONIO H. PAREDES, Director S. A. de la S. M. Co.

Vulcan Iron Works,
135-145 Fremont St., San Francisco.

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 51 Fremont St., San Francisco.

The Blasdel Concentrating Belt Co.

OWING to improved machinery we are now able to sell our NEW IMPROVED CONCENTRATING BELTS for the "Triumph" or Frue Vanners at reduced prices; also our Improved Belts six feet in width.

Practical mill men must see at a glance the advantage of our belts over any other.

First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.

Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.

We manufacture smooth belts with our Improved Flanges to order. Send for references.

PATENT MODELS and Experimental Machinery of all kinds.
SHAFTING, PULLEYS and BOXES.
ENGINES and BOILERS.

DRAWINGS, PLANS and SPECIFICATIONS made for new machinery.

JOBBING of every description promptly attended to. FINE WORKMANSHIP GUARANTEED.

Also Pacific Coast Agents for the SHARPLES CREAM SEPARATORS.

DEWEY & CO., 220 Market St., SAN FRANCISCO,

PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Mechanical Progress.

Hydraulic Propulsion of Vessels.

Among recent notable inventions is a device for the hydraulic propulsion of vessels, by Mr. James C. Walker of Waco, Texas, adapted to river craft as well as to ocean and lake propellers. The present invention may properly be considered as auxiliary to one patented by the same inventor some time previously. The two inventions combined represent a vessel propelled by longitudinal tubular waterways (submerged), the water being forced by spiral wheels driven by engine power with great force and ejected in jets at nozzles rearwardly directed, the reactive force of which jets propels the vessel. The improvement also comprises means for the drainage or expulsion of the water that may accumulate in the hold of the vessel. The tubular waterways already mentioned extend fore and aft, being larger in front and tapering toward the stern. Lateral branches project through the sides of the hull, each terminating with a nozzle pivoted in a ball and socket connection. The nozzle is curved to be presented in the plane of progress, and is arranged reversible to back the vessel. The rear nozzles are arranged for lateral swing to serve for steering the vessel as well as for propulsion. Means are provided, embodying a rack bar and pinion mechanism, whereby the side series of nozzles can be reversed simultaneously. The drainage feature comprises a depression or well in the lowest part of the hold. A pipe leads from this to the stern at a point above the water line and projects outward. A branch pipe is led from the propulsion pipe and joins the drain pipe near its terminus, and the junction is outwardly directed. When the drainage is to be effected, a portion of the water from the propulsion tube is directed through the branch, and the discharge of water causes a suction draft that takes all the accumulation from the well in the hold. Fire plugs are also provided at intervals, to which hose can be attached in case of fire, the pressure of water being ample to force the stream for extinguishing the fire. Suitable valves are provided in the pipes to shut out the water in case of any necessity therefor.

Crude Oil as Fuel.

On Friday night last Mr. A. M. Hunt gave an address before the Technical Society in this city on "Crude Oil and Its Use as Fuel." In presenting the subject he said that the output of oil in this State is about 50,000 barrels a mouth, the product being in some cases very light and in others quite heavy. So far oil in any considerable quantities has only been found in southern California.

The cost of transportation he found operated against its use to any great extent outside of the sections in which it is mined, giving coal the advantage. In discussing the methods employed in burning oil he had found that small burners produced better combustion and generally gave better results. He said that it was almost impossible to get a satisfactory comparison of the relative adaptability of oil and coal as a fuel, but from extensive experiments made during the Midwinter Fair he believes that oil was three to one times as valuable as its rival.

In the matter of economy in handling, in cleanliness and in the saving of labor there could be no comparison. He also pointed out the direct advantage gained in the use of oil is that perfect control of the burner exists, thus preventing waste. He had found, too, that its action on the boilers was less destructive than coal. He believed that there was not a smithy in the city which could not make a great saving by its use.

The manufacturers about Los Angeles were, he said, nearly all using it in their plants, and could not be induced to return to the flint fuel. A number of wells are being sunk in that locality.

In the discussion which followed the address one of the members said that the supply of oil in the State was comparatively insignificant, and he thought would have to be increased considerably before it would be used to any extent in large plants. He thought, in view of this fact, that anything like a general adoption of petroleum by manufacturers would have the effect of totally exhausting the supply in short order.

A NEW KIND OF ELEVATOR for use in mines is mentioned by the English mining journals. It is constructed so that one side exactly balances the other. On one side is a large cage on which a loaded car is run, to be hoisted to the top of the mill, and on the other is a huge iron water tank capable of holding sufficient water to raise the car, load and carman to the top. The carman, from his station at the bottom, pulls a rope which opens a stop cock and fills the tank with water, at which the tanks descends, and the cage, containing car, carman and all, rises to the top of the bin, when the car is dumped. The carman then pulls another rope, which opens a valve at the bottom of the tank and lets the water out, and thus the cage and car, now being the heaviest, descends, its movement, of course, being always under the control of the operator or carman. The cage is provided with strong brakes, capable of holding it and the contents stationary at any point, either in going up or coming down, and the whole is hung on an eight-foot wheel by a one-and-a-half inch wire rope of great holding capacity.

THERE is a class of mechanics, says the *Scientific Machinist*, in which is numbered many excellent workmen, who never miss an opportunity to laugh to scorn the knowledge of the "school" bred artisan and the young mechanical engineer from a technical college. They are full of "wise saws and modern instances," the intended deductions from which are that those artisans and engineers are ignoramuses and asses, judged from the standpoint of "practical" mechanics. These practical men are entirely sincere, and would be surprised to be told their egotism is more of an obstacle to usefulness than the alleged impracticability of the objects of their criticism. The manual training, trade and engineering schools are yet young, but old enough to demonstrate the great practical benefit of the training they give.

Washington Navy Yard.

If it were not for the Ordnance Department, the Washington Navy Yard would practically be deserted at this time of year. Of course, the enrollment of marines and the enlistment of sailors goes on all the year round, but in the summer months many of the officers are away on their vacations, and the yard, as a whole, wears a look of peace. The gun shops and projectile departments apparently do not suffer from the depression. It is in these departments that the Government comes more closely in competition with outside manufacturers and outside interests than in any other branch. The employes are paid per diem wages, which are regulated by the wages paid at similar private establishments, and are not allowed leave with pay, as is the case with other Government departments.

Despite the fact that several of the new cruisers are awaiting their armaments, and that other ships will soon be in the same condition, the working force of the Ordnance Department has been reduced one-half since the beginning of the year. Where 2000 men were employed a year ago, there are now only 1000, and it is feared that the force will be still further reduced.

In the south gun shop there are at present twelve guns nearly ready for shipment. Ten of them have been completed and the eleventh is being polished. These guns are among the finest in the world. They weigh sixty tons apiece, are forty feet in length, and have a caliber of thirteen inches. The projectile designed for these monsters weighs 1100 pounds, and when backed by 550 pounds of powder will travel thirteen miles.

It is believed in navy circles that these will be the last guns of this enormous size to be manufactured by Uncle Sam. They are unwieldy, take up too much room, require too many appliances for loading, and are too expensive. The tendency is toward lighter guns, which will fire projectiles having a greater piercing power. It is altogether likely that in a few years no guns will be manufactured in this country with a caliber exceeding ten inches.

THE Panama canal scheme is being revived. Sixty million francs have been raised. The project can be completed, it is thought, with a series of six locks at a cost of five hundred million francs.

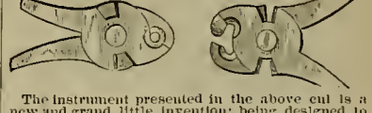
GIANT POWDER FURE CAP FASTENER.


The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.
MOODEY & SHERWOOD Fresno, Cal.

Practical Hydraulics.
A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators.
BY P. M. RANDALL.
This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.
TABLE OF CONTENTS.
The following brief abstract of the contents will give an idea of the branches of the subject treated: General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water Through Openings; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels. Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.
Price, $2.00, postpaid. Sold by DEWEY PUBLISHING Co., Publishers, 220 Market St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

WATER FOR MINES.—*Republican:* The Blue Lakes Water Company are putting in a new pipe line to carry water through Oneida valley, from Tanner hill to Kennedy hill. There are two pipe lines at present, one a fifteen-inch and the other eighteen-inch. Both have been used, as the water required for the Argonaut and Kennedy is too much for one line of pipe to carry. The new pipe line will be twenty-four inches capacity, and will be sufficient of itself to carry all the water required for the mines south of Oneida.

FROM PLYMOUTH.—*Republican:* Everything in the mining line is moving along satisfactorily. A new hoist has been erected at the Lucille. Rapid progress is being made in the shaft, and work is being pushed on the forty-stamp mill.

Negotiations are in progress for the bonding or sale of the Ivanhoe, owned by Wild and Wheeler Bros. A five-stamp mill was erected by the owners, and considerable good paying ore was taken out, but the water bothered, and on account of lack of capital work was suspended.

The new mill at the Bay State is rapidly nearing completion, and sinking is in progress. Everything looks well at this mine.

Dr. Boysou has his machinery all on the ground for his mill at the Pioneer, and it will not he long before the doctor will be crushing rock.

GOVER.—*Republican:* It is reported that James M. McDonald has purchased the first mortgage, held by the Anglo-California bank, on the Gover mine, amounting to $25,000. Whether this will lead to the resumption of work on the property remains to he seen. So far nothing has been done beyond keeping the water out of the mine. The flow of water has abated considerably of late.

DEAD SHEEP MINE.—This mine is situated in Pioneer district, and is owned by A. W. Kimball and three others, owning one-quarter each. They have just completed the erection of hoisting machinery to he operated by steam power. The machinery was obtained from an abandoned mine in Glencoe district, Calaveras county. The shaft of the Dead Sheep is down 170 feet—the deepest in Pioneer district. Several drifts and cross-cuts have been run, showing the vein to be from a few inches to three and four feet in width, the rock being of the high grade character usually met with in that locality. It is claimed that it will go to $160 per ton. The sulphurets are said to be very rich, and all the tailings were run into a reservoir, to be worked over again when better facilities for saving gold could he had. Recently the Gracey mill has been improved by the addition of a couple of concentrators, and it was started up this week on tailings left from the previous run. These tailings assay from $60 to $80 per ton.

BRIGHT.—The delay in the starting up of this mine is due to some defect in papers. There is abundance of capital behind the company. There are 20 men in the enterprise, all men of means, who agree to put up to the extent of $5000 if necessary in the development of the property. This is the way the Kennedy mine was reopened and brought to its present status as one of the leading mines of the State. Several of the parties connected with the Bright enterprise are also heavy stockholders in the Kennedy.

PIONEER DISTRICT.—Mining has taken on a small boom in this, the most easterly district in the county—in active operation. There are three claims upon which work is being done at present: the Dead Sheep, the Grieshach, and the claim which is being opened by Mr. Weeks of San Francisco.

Calaveras.

A GOOD PROPERTY.—*Chronicle:* Work at the Lamphear mine is progressing favorably, and what is still better the ore extracted is paying a dividend to the owners of the mine. The last cleanup, after a thirty days' run, yielded $6341. The cost of getting the ore, milling, etc., was $1000, leaving a profit of $5341. Since the bonding of the mine by the company there has been taken out $10,851, and the total expenses were $1800, leaving as a clear profit for the owners of the mine the neat little sum of $9051. And when it is taken into consideration that all this was done while the work of development was going on in the mine, and during a period of less than six weeks, proves beyond a doubt that the property will be a permanent, dividend-paying proposition. We have been informed by reliable authority that the present company have refused an offer of $100,000 for their property.

THE HERROLD MINE.—Calaveras *Chronicle:* Work on the Herrold mine at Big Bar Bridge on the Mokelumne River is progressing even better than the management expected, considering the brief time that has elapsed since the property changed hands a little over a month ago. Under the new management an adit tunnel 100 feet in length has been run from the south bank of the river in the distance of the ore vein. It is thought that sixty feet more will cut the lode sixty feet below the upper tunnel. In the meantime the four-roller Huntington mill is kept at work day times from a winze that is being sunk from the upper tunnel. Night and day shifts are at work both in the tunnel and winze, and ten men are employed in and about the mine. The first run of fifteen tons from the mine under the present management was cleaned up and proved very satisfactory. The quartz much resembles the Mother vein ores, excepting in the one feature that the galena sulphurets are more generally met with here than on the Mother Lodes proper. The winze is now down twenty feet and sinking is being carried on at the rate of three feet per day. The mill is taking quicksilver for $15 per ton ore.

The Herrold mine is opposite to the Moser mine on the north of the granite horse or protrusion in the Mother Zone. We predict for the Herrold a bright future.

Inyo.

BIG PINE.—*Register:* Mr. Rochford of the Montezuma has lately found a ledge of travertine, a few miles from Big Pine. This stone polishes nicely and is quite extensive.

The developments at the Ibex mine, under the supervision of Sam Thompson, are progressing rapidly. He reports an eight-foot ledge, carrying a good quality of ore.

The mines at Fish Springs are looking well, and the boys are doing fairly well for the season.

Kern.

REDROCK AND GOLER.—Inyo *Register:* We learn that probably 100 men are at work in that section, and doing well. Nuggets of some size are being found, one lately picked up being worth $428. These nuggets are covered with a lime crust. The finder of the $428 nugget did not know that he had picked up gold until happening to rub the chunk on his overalls, thus wiping off the lime, he saw the yellow metal shining. In Goler another lucky miner found a little stack of nuggets in a compact pyramid, looking as though they had been all buried or hidden together at some time. The claims known as the Mexican were sold recently to R. F. Del Valle, the prominent Los Angeles politician. The work being done by the Bonanza Company is expected to make a valuable property, as it will substitute sluices for dry washing, and work the dirt to better advantage than is now done. Good discoveries are reported from Black Mountain, the section in which the Brockman claims are located. Altogether, it seems that while the Redrock excitement is quieting down, that country is proving its worth.

Mariposa.

RECENT INVESTMENTS.—Grass Valley *Telegraph:* Chas. E. Uren, mining and civil engineer, has been in Mariposa county and he has done some important work there. Our reporter interviewed the gentleman and he furnished us with the following interesting news: Considerable capital has been recently invested in the mines along the mother lode in Mariposa county, and the people are naturally rejoicing over the prospect of renewed activity in the mining industry which has remained dormant for nearly thirty years. Within the last few months capitalists have been buying mines outside of the grant.

The Sierra Buttes Company of Sierra county, an English company, has recently purchased several mines at Whitlock and is making extensive preparations to work them in the spring. These mines are reputed to he rich and are situated on the mother lode.

Another company has purchased the Cook mines, situated immediately south of Coulterville, and is also making preparations to work them extensively.

A San Francisco company—the California Mining Company—is at present working the Crown Peak mines, near Bear valley on the Merced river, nearly adjoining the celebrated Josephine mine. All of these are on the mother lode and will unquestionably develop into good properties.

Nevada.

LAWREY MINE PURCHASED.—Grass Valley *Union:* Jas. M. Wishart of Topeka, Kan., and E. F. Aiken of Oakland have bought the Lawrey mine on Winchester Hill. The mine now becomes the property of the Rosehill Gold Mining Company, and work will be pushed on it shortly.

LIVE YANKEE.—*Transcript:* The company having a bond on the old Live Yankee or Fortuna mine, on the Grass Valley road, are getting ready for active work. The machinery is being thoroughly overhauled, and is to be reset upon a concrete foundation. New buildings are to be erected and everything put in good shape.

THE REWARD MINE.—Nevada *Transcript:* It is expected that the drain tunnel that is being run to tap the Reward mine will be completed in a few weeks. About 100 feet are yet to be run. This tunnel will drain the mine to a depth of 500 feet. It is the company's intention to crowd work in the mine as soon as this tunnel is completed and to open up the property in a thorough manner. They have a good ledge, which is thought to be an extension of the old California mine. In running the drain tunnel several shoots of quartz were cut through, but only that which was in a direct line with the tunnel was taken out. Twenty tons of this rock was crushed a few days ago and paid about $20 per ton. The Reward is owned by R. C. Walrath, Joseph Thomas and others, and is located near the old rifle grounds. We expect to see a good force of men at work there before many months.

NEVADA.

Kennedy District.

THE GOLD CAMP.—Reno *Journal:* A *Journal* representative met J. A. Blossom, and had a conversation with him regarding the mining outlook in Lander and Humboldt counties. Mr. Blossom had just returned from Kennedy District, the new El Dorado, which is attracting more attention at the present time than any other mining section of the coast. In reply to a question by a reporter, Mr. Blossom said:

"Yes, the mines in Kennedy District look well and are quite extensive. The Imperial mill has made two successful runs and demonstrated beyond a doubt that the heavy sulphuret ores of the district can be successfully and profitably reduced on the ground. Mr. Austin is prepared to erect works to reduce ores that have been considered too refractory to be worked by ordinary mill process. The Imperial mill is running steadily and the Jenkins mill will be ready to start up about October 6th on Pride of the Mountian ore. There are many mining locations in the district, some of which have been developed to a considerable extent. Besides the Imperial, there is the Gold Note, better known as the Irish Boy's mine.

"The vein has been cut in the lower tunnel, which is 300 feet from the surface on the course of the vein. At the greatest depth attained the vein is three feet wide and the ore averages from $50 to $100 per ton in gold. Wiggins and Wilson have struck the same vein or a similar one in their mine. I am informed that a shipment of ore from this mine yielded about $100 a ton at the Reno Reduction Works. A dozen or more mines are being developed, and besides those mentioned the Crown Point and the Sam & Bloss group give promise of being good properties.

"What are the facilities for working ores in the camp?" queried the reporter.

"There is plenty of ore for milling and domestic purposes," replied Mr. Blossom. "Nut pine wood is delivered in quantity at $5 per cord and sagebrush at $2 per cord."

"It is reported that the town of Kennedy is being built rapidly and substantially," said the reporter.

"Yes," said Mr. Blossom, "there are several two-story buildings already erected in Kennedy. There are three stores which deal in general merchandise, five or six restaurants, two or three lodging houses, two assay offices, two or three blacksmith shops, two meat markets, a town hall, a newspaper office—*New Era*—and several saloons, and there will be 350 or 400 votes polled in November. There are two stages, one daily and one tri-weekly, to the railroad and Winnemucca, and freight is laid down in the town for $15 per ton from the Central Pacific railroad. The town is 35 miles from Bridges station on the Nevada Central, but at present freight is hauled exclusively from Winnemucca and Battle Mountain. The permanency of the mines is assured beyond doubt, and in my opinion Kennedy will within a year he one of the most productive mining districts in the State."

Washoe District.

SIERRA NEVADA.—Virginia *Enterprise:* The north lateral drift No. 2, started at a point 385 feet west from the mouth of intermediate tunnel, has been advanced eighteen feet; total length 168 feet; face in quartz, clay and porphyry.

The northwest drift at a point 100 feet west of the mouth of the Dayton tunnel, is out ten feet; face in prophyry and quartz.

The east crosscut No. 1, from north lateral drift No. 2, at a point 140 feet north of intermediate tunnel, is out twelve feet; face in quartz and porphyry.

S. N., M. & U. SHAFT.—The east crosscut from the north lateral drift, 450 feet north of the west drift, 1520 feet west of the shaft, 900 level, has been advanced during the week twenty-six feet; total length, ninety-six feet; face in quartz, clay and porphyry.

The west crosscut from the Union Con. south lateral drift from the west drift, 1520 feet west of the shaft, 900 level, has been extended twenty-four feet during the week; total length, 102 feet; face in clay and porphyry.

UNION SHAFT.—East crosscut from the north lateral drift, 450 feet north of west drift, 1520 feet west of shaft, 900 level, has been advanced during the week twenty-six feet; total length, ninety-six feet; face in quartz and porphyry. The west crosscut from Union Con. south lateral drift from west drift, 1520 feet west of shaft, has been extended twenty-four feet during the week: total length, 102 feet; face in clay and porphyry.

CHOLLAR.—From the west crosscut thirty feet south of our north line, 450 level, we have run north and south on the ore cut in the crosscut and found it extended twenty feet in each way. We are now raising over the crosscut and are now up ten feet; the pay is four feet wide in the top, and assays from $25 to $60 per ton per face samples.

We are making good progress in the work of cleaning out and repairing the north drift on the 550 level, and in retimbering the 900 station at the top of the main incline.

POTOSI.—Crosscut No. 5, started from the south drift, 450 level, was extended twenty-seven feet; total length seventy-four feet. Face is clay and porphyry.

The winze from the surface 180 feet south of north line, is cleaned out and repaired to the depth of ninety feet; from the bottom of which a drift has been started to the northwest.

WARD COMBINATION SHAFT.—The west drift from Ward shaft, 820 level, was advanced sixteen feet during the week; total length, 1122 feet; face in soft porphyry with a slight seepage of water.

BULLION.—The west drift from the Ward shaft, 820 level, has been extended sixteen feet during the week; total length, 1122 feet; face in soft porphyry and clay with a slight seepage of water.

ALPHA.—During the past week have cleaned out and retimbered five feet of the shaft below the 220 level; total depth of shaft cleaned out and retimbered, 385 feet. We have cleaned out and hulkheaded the 482 station.

ARIZONA.

BULLION YIELD.—Yuma *Times:* The gold yield of Arizona for the twelve months ending June 30th, this year, was more than $2,000,000, and from the present rate of production the output for the year 1894 will reach over $4,000,000. This is certainly most encouraging. The silver output for the same period was over $2,000,000 in value, which, had the old price prevailed, would have reached nearly $4,000,000. The copper output was over 45,000,000 pounds, and there was over 5,000,000 pounds of lead; yet there be those who seem to think that Arizona is not keeping up her quota of bullion production.

PROMISING.—It is reported from the People's Mining, Milling and Investment Co.'s camp, in the Gunsight district, that in the sixty-seven foot shaft, where the ore was broken off, the lead has again been struck and the ore is good. Everything looks promising in the camp.

COLORADO.

A MILLING CENTER.—*Gazette:* Idaho Springs is rapidly becoming a great milling center. It has not been so many years since that a stamp mill or concentrator was thought to be a losing venture here. Now we have not enough of such mills. The Donalson and Silver Age concentrators are taxed to their utmost capacity, and even then cannot handle all their ore, and the stamp mills Viz, Mixsell, Thomas, Wilkie, Bismark, Newton and the Donalson are running full blast day and night. Surely there must be some one taking out money. If we were away on top of the range, or 200 miles from civilization, what a great camp this would be!

MONTANA.

A PROSPEROUS CAMP.—Helena *Independent:* A quartz camp that is attracting much attention just now is that in Lump gulch. It is situated on the west side of Prickly Pear, two miles north of Clancy, or about thirteen miles southeast of Helena, and nearly opposite the old Legal Tender mine, where over a million dollars was taken out in the early days, people having been going over the ground for twenty years. The leads are only a foot wide on top, but increase to two feet at a depth of 300 feet. The ores are refractory, containing zinc and silver, but the zinc runs into lead as depth is attained, and they go about 250 ounces in silver to the ton. The leads run north of east and south of west, and go down perpendicular, running across the granite formation, which mineralogists say are true fissure veins. Two steam hoists are on the Liverpool and Washington claims, which are down 200 and 300 feet respectively. The ores from these mines are shipped to the East Helena smelter. Two lines of railroad pass by the mouth of the gulch, where a townsite is said to have been surveyed. About 100 men are working for wages in the camp, which is probably three miles square, and as many more are prospecting.

THE FREED GROUP SOLD.—*Northwest:* An English syndicate has effected the purchase from M. M. Freed, of Dillon, of his well known group of gold properties situated on the Big Hole river in Madison county and about twelve miles from Melrose. The price agreed upon is $425,000. The first payment of $20,000 is due in thirty days. One of the points in the agreement is that a forty-stamp mill be immediately erected upon the property and that $100,000 be expended in development work, which shall include the erection of mills and their equipment with machinery, electric light plant and all other necessary buildings.

The deal has been developing for nearly a year and most of the negotiations were carried on by cable, one of the minor items in the matter being a bill of $1500 for cablegrams alone. Messrs. Birkin and Yound, who looked after the English end of the bargain, represent one of the richest mining syndicates in England. The title of the new company is the Madison County Gold Mining Company, Limited.

NEW MEXICO.

GOLD.—*Southwest Sentinel:* The Mammoth, Atlantic and Bell mines are all running in Pinos Altos, grinding out gold.

The fourth level has been started on the famous Texas mine at Central, at a depth of 300 feet. Five men are at work carrying ahead development.

A hundred and twenty-five carloads of iron ore were shipped from the Hanover district during September. This is the largest amount yet shipped from Hanover during any one month.

The Barringer syndicate shipped seventy carloads of iron ore from Grant county to the smelter at Pueblo last month. This iron ore is noted for its purity and excellent qualities.

On the Grand Central mine at Central a drift is being pushed east at a depth of 140 feet. This drift is now about fifty-five feet long. A shipment of four tons of first-class ore was made last week which ran $40 in gold and 250 ounces in silver to the ton. Messrs. Potter & Craig, the lessees, are now sorting out a carload of second-class ore for shipment. They expect to sort this ore up so as to run about $10 in gold and eighty ounces in silver

OREGON.

BROWNTOWN NOTES.—Rogue River *Courier:* Baldwin and the Skeeter Bros. are pushing down their incline, with the ledge in full view, showing a compact body of good ore.

Roht. Dieky and others are fixing to open up a placer mine on Johnson's gulch.

Krouse and Frank Floyd have found some good quartz on the Main Divide, which they hope to develop next spring.

The Riese Bros. have found some good placer ground on one of the tributaries of the Rim gulch, and are working hard.

Hopkins, Croshy and Bridges have been doing some development work on the Sunny Side lode, a ledge at the head of Malvania gulch, which, although small on the surface, seems to increase in breadth as it goes down, and which prospects well in free gold.

Clemn is opening a new tunnel on the old Enterprise lode, which will tap the pay chute at a depth of seventy-five feet; here there is a large body of ore, all of which prospects in free gold to the pan.

Gardner is fixing up to work his placer claim on the left-hand fork during the winter. In the spring he proposes to sink deep on a quartz ledge which he opened this summer.

Mr. Ireland with his crew of seven are hard at work on their new ditch and dam. This is a Roseburg company with sixteen members and 320 acres of mining ground.

ANOTHER STAMP MILL. — Rogue River *Courier:* The Bone of Contention owners are busy setting up an eight-stamp mill at the

works. A. Sparlin and son Ira have been hauling the plant, which arrived from San Francisco last week. L. J. Kendrick, the superintendent, reports a tunnel 500 feet into the mountain and a well-defined streak of pay ore four feet wide between walls. The pay streak sometimes narrows to two inches, but the distance between walls averages four feet. Some big developments are expected from this mine.

THE WIMER PLACERS.—The owners of the Wimer placer mines near Waldo have spent several years constructing a free outlet for their tailings and are now on the eve of attracting some of their richest banks and making big money. Perseverance and push have accomplished much in bringing these golden buttes under the monitor's influence and the reward is nigh.

DOC IRELAND BAR.—T. J. Clark and F. H. Riggs have a paying placer on Doc Ireland bar near Grave creek, ten miles below Leland. They have eighty acres of pay dirt and water for six months in the year, with eighty-foot pressure. A ditch and flume bring the water from Rock creek, three and a half miles away.

WASHINGTON.

FROM LOOMISTON. *Journal:* Messrs. Miller, Redpath and Winchell contemplate putting in a winter's work on their claims on Mt. Chapaca. They are now building their cabin and have employed Harry Moore to help them. Their mines lay not far from the famous Rush group, and we predict that their efforts will help to make old Chapaca great.

Messrs. Hunter, Griffin and Wm. Chilson returned Monday evening from a ten days' trip into British Columbia on the north fork of Kettle river. They brought in some exceedingly fine ore—a new discovery of Mr. Griffin's—and they say that they have made a very important find.

Messrs. Miller, Winchell and Redpath will probably make a run of twenty tons or so of their ore this fall. They now have about 100 tons on the dump.

WAGON ROAD TO THE MINES.—Spokane *Review:* C. P. Ondin returned yesterday from the Trail creek mines. He says the wagon road from Northport to the mining camps will be finished in ten days and a large quantity of gold will come out during the coming winter. He brought down a well filled chamois purse as evidence that the five-stamp mill on the O. K. is doing good work.

ALASKA.

GOULD & CURRY.—Alaska *Mining Record:* Mr. D. W. Walker, who has become interested in the lease and bond held on the Gould & Curry mine on Sheep creek together with Mr. John Brogan, returned to the Chilkat from a business trip below, where he purchased a pack train of eight horses. The animals will be shipped up on the next steamer, and will immediately be placed on the trail packing ore from the mine to the Silver Queen stamp mill. The Gould & Curry mine is one of the most promising gold properties in this section. The ore is comparatively free milling, and will average upwards of $30 to the ton in free gold. Enough development work has been done on the mine to show the veins to be permanent for a considerable depth at least, and altogether the indications are good for a rich little mine. It is situated near the summit of the range at the head of Sheep Creek Basin, and its inaccessibility has heretofore been the one damper to its operation years ago, but now with the improved and cheap tramway system, which are able to transport ore from the very clouds, over otherwise impassable gorges and precipices, and with men of energy to back such an enterprise, high-line claims can be worked just as advantageously and with as little expense as those lying lower down.

On the tramway leading to the Ground Hog mine in Silver Bow Basin, operated by the Nowell Gold Mining Company, the terminal stations are now lit up with arc electric lights. There are over 20 of these lights along the line, and they light up the steep mountain side and beetling crags with beautiful effect, and greatly facilitate the work of operating the tramway. The tramway is completed throughout and is now in operation conveying ore from the mine. It has a capacity of 200 tons per day of twenty-four hours, and operates smoothly and without a hitch. The mill will be started up some time during the week.

Superintendent Frank C. Hammond, of the Silver Queen mine at Sheep creek, has increased his force of men by ten, and thinks he will be able to operate the mill for two months more at least. On the last steamer the Queen shipped four tons of concentrates to the Tacoma smelter. Mr. Hammond states that the mine never looked better and was turning out rich ore. The mines of Sheep creek will prove to be a great bonanza to the country when they are systematically opened up and worked.

As soon as the mail boat arrives, the Rustler will leave for Berners Bay with the pile-driver in tow and a crew of men for its operation. It is supposed that the extensive improvements at that place will afford employment for a large number of men during the entire winter.

The air compressor and other machinery for the enlargement of the Berner's Bay Mining & Milling Co's plant at Berners Bay was placed aboard the schooner Onyx on Saturday for transportation to that place.

Work is progressing rapidly on the Bald Eagle mine at Sum Dum Bay, and the management are highly elated over past results. The mine still continues to turn out very rich ore.

Mr. Wm. Ebner is interested in a claim at Shuck Bay from which his two partners, F. Micho and Geo. Dakes, recently extracted some very rich gold ore.

On the down-going Topeka the Berners Bay Mining and Milling Co. shipped 57 tons of concentrates from the Comet mine to the Tacoma smelter.

Coast Industrial Notes.

—The coal mines of the State of Washington give employment to about 3000 men. Coal mining is one of the chief resources of the State.

—A gang of men are busily engaged in the preliminary work of building a new iron bridge for the V. & T. across the Truckee river at Reno.

—The steam wagons are hauling lumber from Foulks & Powning's mill, near Reno, to Verdi, making two trips per day and hauling 70,000 feet.

—J. H. Thies informs the *Journal* that a company has been organized at Lovelocks, to build a flouring mill. He has purchased 40,000 feet of lumber from the Verdi Mill and Lumber Company for the building. The mill will be of the capacity of fifty barrels per day. The latest improved machinery will be put in the mill. It is expected to have the mill in running order about New Year.

The contractors at the Government works at the locks near The Dalles, Or., expect to put 1000 men at work in a few days. It is reported that another electric-light plant will be put in operation, and gangs of men will be worked day and night. It appears to be the intention of completing the canal at the earliest possible date, and it is expected that boats will pass through the canal in the fall of 1895.

—There is a heavy business in copper, with steady prices, the greatest demand being for fine grades. Lake is quoted at 9⅝@9¾, but holders ask 10. Electrolytic, which was offered for 9¼ last week, now commands 9⅝@9¾. Arizona pig is selling at 8⅞@9, while casting brands are held at 9⅛@9¼. Exports are decreasing, but home consumption is rapidly increasing.

—The Carson *Appeal* says: Some time ago the *Appeal* stated that negotiations were pending between the Sierra Nevada Wood and Lumber Company and the Carson & Tahoe Lumber and Flume Company toward buying the former out. The other papers disputed this proposition, but now admit that the Tahoe company has purchased the wood and lumber interests of the other company.

—Leigh Harnett says: "I assert with the certainty born of a long and critical personal investigation that Oregon has whole mountains of marble of as absolute purity, fine texture and beautiful variegations as Italy ever produced. They exist in Wallowa, Douglas, Josephine and Jackson counties, and perhaps elsewhere. In all but the last county I have personally seen them. From these vast deposits I have gathered every variety except the absolutely 'antique green,' as it is called, but as this is the rarest of all known to the world, we can afford to let that go, as it is too costly for general use. In my travels through Oregon, I have found eight varieties, from pure black to pure white. When polished in San Francisco, these samples were pronounced equal if not superior to any foreign marbles in our market, especially the black and white. Of the purity of our Oregon marble, I may say a sample from Douglas county took the first prize for purity in the late World's Fair at Chicago. Such an award ought to satisfy the most skeptical."

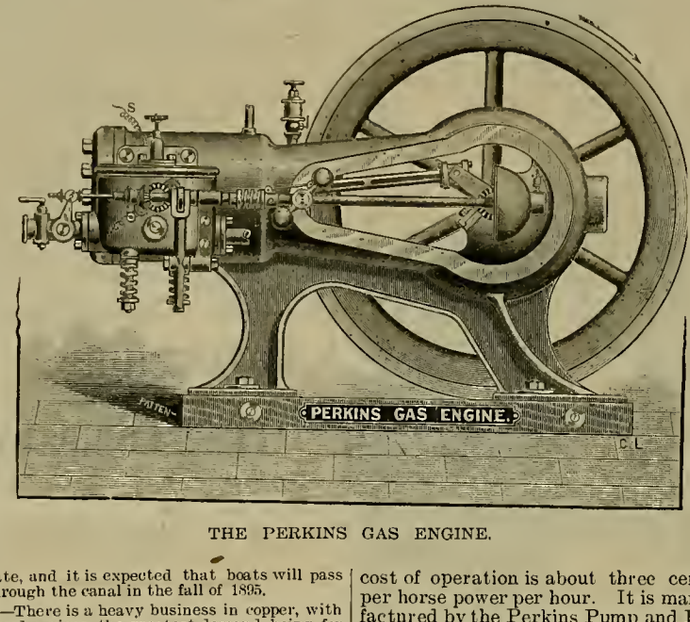
—A San Bernardino dispatch says that A. P. McGinnis, receiver of the Bear Valley Reservoir Company, left that city Saturday morning with a large force of men for Bear Valley lake. D. P. N. Little of Los Angeles has taken the contract to clear the reservoir of standing timber and debris, preparatory to the construction of a new dam next year. A Chicago, English and Scotch syndicate, on the 8th of October, will, at the public sale under the order of the court, buy out the entire plant, backed by a capital of $2,500,000. A new dam ninety feet high will be erected next season, and the canals, pipe lines and ditches will be built this winter. The new reservoir will contain five times the water of the old dam, or a continuous flow of 14,000 inches, with a holdover of the same amount for the next season. This will irrigate every foot of unoccupied land in the San Bernardino and Perris valleys. The new company propose to make a great summer resort of the lake region, and to operate car lines and works with electricity developed by water power at the dam site.

A Simple and Compact Gas Engine.

The accompanying illustration represents the new "Perkins" gas engine. As can be seen at a glance, the engine is both graceful and compact in design. Its claims to superiority cover several points, among which are perfect combustion of gas, cheapness and simplicity of operation, adjustable sparking device by which ignition of the gas is obtained at any point of revolution, easy to start, uniform motion, perfect lubrication of all parts, no vibration, etc.

Another important feature of this engine is that, by a simple exchange of mechanical attachments, it can be adapted to the use of common city gas, gasoline or kerosene oil.

Mechanical engineers say that for accessibility to wearing parts, economy of space, strength and durability, the "Perkins" engine has no equal. The



THE PERKINS GAS ENGINE.

cost of operation is about three cents per horse power per hour. It is manufactured by the Perkins Pump and Engine Co., 117 Main street, San Francisco. Those who contemplate the purchase of motive power for any purpose will do well to give this engine their consideration. An illustrated catalogue will be sent upon request.

Improved Steel Snatch Block.

Attention is called to the advertisement in another column of the "Harvey" Snatch Block. Though the block is in very general use, the cut accompanying the advertisement will enable those who are not already familiar with its construction to form some idea of its advantages over the ordinary kind. One of its chief claims to favor is the guiding ribs secured to the inner surface of the cheek plates, which cover the spaces between the sides of the pulley and the sides of the cheek plate, thus providing a smooth running channel for the cable, without the possibility of its becoming jammed, as is the case with the common block. Another strong feature is that the opening side of the block is a solid piece, easily manipulated under all conditions and giving added strength to the whole. Those who are interested can obtain a clearer idea of the many advantages of the "Harvey" Improved Steel Snatch Block by sending for an illustrated circular to the manufacturers, The California Stump Puller Co., 82-84 Zoe street, San Francisco, Cal.

Removal.

The Judson Dynamite and Powder Company has moved its office from No. 18 California street to No. 200 Market street, at the junction of Pine street.

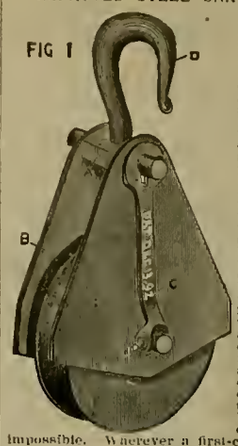
TUBBS CORDAGE CO.
(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. ☞Extra sizes and lengths made to order on short notice

611 and 613 FRONT ST., San Francisco, Cal.

California Inventors Should consult DEWEY & CO. AMERICAN and FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. No. 220 Market St., San Francisco, Cal.

IMPROVED STEEL SNATCH BLOCK.



This is admitted by experts to be the best block of the kind in existence. Being made of the best quality of refined steel, it gives greater strength in proportion to its weight, and the opening side being a solid piece, does not detract from its strength as in other blocks. In using wire cable, the damage to which the cable is subject in other blocks by jamming between the cheek plate of the block and rim of the pulley is entirely overcome, as the guiding ribs B, as shown in the cut, are snugly filled to the inner surface of the cheek plates and completely cover the rim of the pulley, making accidents of this kind impossible. Wherever a first-class block is required, it is superior to any other. *Catalogues sent free.* Address, **CALIFORNIA STUMP PULLER CO., 82-84 Zoe Street, San Francisco, Cal.**

The Russell Process.

For information concerning this process for the reduction of ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

J. F. CROSETT,
Commission Mine Broker,
628 SACRAMENTO STREET.

I have five customers looking for income-paying mines for London, to be valued from $200,000 to $5,000,000. I also want ten income-paying properties for customers residing in San Francisco, Chicago, Denver, New York and Philadelphia. Owners of mines desiring to sell can make quick sales by seeing or writing me. I also invite investors to consider properties I have to offer.

Gold Quartz Mine For Sale.
MILLING PROPOSITION.

No money down. A 20-stamp mill must be erected and mine can be paid for out of product of bullion. The property consists of two claims 1500x600 each. Width of ledge, 1½ foot to 4 feet. Ore runs from $10 to $20 per ton. $75,000 estimated in sight. Two tunnels run in on vein for some distance. Price, $30,000. This is a snap. Owner can be seen in San Francisco.

Further particulars, reports, etc., can be had of

J. F. CROSETT, 628 Sacramento St.
SAN FRANCISCO.

GOLD MINE
FOR SALE.

First class in every respect. Large body of ore in sight. Ten-stamp mill. Producing good profit every month. Former owner dead and heirs desire to close estate. It has a six-foot vein, $10 ore. See

DUCHOW, DRAKE & CO.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Electrical Progress.

Electricity in War.

It is interesting to uote the important part played by electrical appliances in the war now being waged betweeu China and Japan. The Japanese, especially, are quick to turn to account any advantage offered by scientific appliances, and in Corea they have materially strengthened their hands by taking possession of the lines and stations of the telegraph service. Their men are trained in constructions as well as in actual manipulation, and can be trusted to keep the lines in working order as long as they retain control. The Mikado's people have taken very kindly to the telegraph since its introduction in 1870. Their first installation of a couple of short lines, about forty miles long altogether, speedily grew into 4000 miles, and now the wires devoted to the service measure close on 26,000 miles, including several submarine cables of various lengths, one of the longest being that connecting Nipon (the main island) with Tsu-shima, the large islaud midway between Japan and Corea, a position which, as may be readily imagined, is just now of the utmost strategical importance. So well, indeed, have these clever copyists appropriated and used the telegraphic developments of Western civilization, that there is now hardly a point on the coast more than a few hours distant from the telegraph office, so that a fleet runner could convey the news of a hostile descent to the adjacent outpost, and a defensive force be called to the threatened region in less time than it would take the Chinamen to determine upon their point of attack. This was demonstrated very clearly in 1876, when the news of the Satsuma rebellion was brought by a boatman to Kumamoto in one night and flashed to the capital almost before the insurgents' rear guard had cleared from Kagoshüna.

The consequence was that the rebel General Saigo was promptly met and snuffed out before he had reached territory in which his forces might have become dangerous through being augmented by nuuerous sympathizers. But for the telegraph there would doubtless have been serious trouble, for it would have taken a fortnight for a rumor to reach the capital, and the delay would have been all in favor of Saigo. Iu the matter of field telegraphy, too, the Japanese are adepts, their portable instruments, etc., being modeled upon apparatus which they have imported from Europe. The posts are made in sections, with spiked bases to stick in the soil, and the wire runs out from the reels on light handbarrows. The Japanese are entirely undisturbed by any considerations as to patent infringement. When the first telephone receiver reached Japan from America it was received with delight and enthusiasm, and within a week or so there were some Edison receivers of uative make being experimented upon. The police and fire brigade systems of telephonic alarms and calls now established in Japan are complete in every detail. Mauy of the Japanese vessels are furnished with the electric light, and it is stated that the manipulatiou of the projectors is remarkably efficient. Notice has been given that owing to the outbreak of the war, lights on the Formosa coast have been extinguished, and no doubt others, both in Japan and China, will also be put out, or false lights substituted, to suit the purpose of either. It will therefore be necessary for all steamers navigating those waters to be extremely careful, and a correspondent of a London daily suggests that one of the best precautions is to use the "submarine sentry," as by its aid a vessel going at ten knots can be assured that she has at least twenty fathoms of water under her keel, and warning is given ou board if less depth is reached, thus giving ample time for position to be verified. The "submarine sentry" is a recently invented electrical arrangement for giving the warning mentioned.

Interior Electric Lighting.

The importance of a thoroughly diffused light, if injury to the human eye is to be avoided, is a point apt to be overlooked in these days of electric and iucandescent gas illumination. Diffused lighting emanating from not too brilliant sources is better in every way than that which, though equal in absolute quantity, proceeds from intensely bright points. The paralyzing effect and ultimate injury to the eye produced by frequent exhibitions of powerful naked lights of any kind is a proof of this. All lights of great brilliancy should be placed above the ordinary line of vision and ought to be suitably shaded.

It is well known that by mixing two properly chosen spectrum colors white light can be formed, and the whiter the resultant light the more blue and violet there is in its spectrum. There is, therefore, a large quantity of blue and violet rays in the electric light. It has been shown that the well-marked color of light from an electric arc between carbon points is due to incandescence of the carbon vapor occupying the space between the two electrodes. This space constitutes the true arc, the space being filled with the carbon vapor, which has a brilliant violet color. It would be correct to say that the arc light is mainly an incandescent light, as the effect is produced by a layer of carbon being constantly evaporated at an extremely high temperature. Therefore the light of the carbon arc is not and cannot be white, although, as we have just mentioned, the very fact of violet being present iu large proportions gives it an apparent whiteness which is so delusive. The light is really violet-tinted owing to the carbon vapor usually present between the carbon poles.

Storage Battery Boats.

Of the 500 or 600 electric roads in this country, a large proportion reach natural or artificial waters, such as lakes or rivers, and in all parts of the country a large amount of work is now beiug done iu the utilization of the current from the trolley wires for charging storage battery boats to ply on these waters. The success of the World's Fair electric fleet, which carried without an accident 1,000,000 passengers on the lagoons and canals in Jackson Park, directed attention to the subject, and now the fleet is beiug dispersed to all points of the compass for kindred employment. It is pointed out that a street railway which will carry a passenger for an hour for five cents can easily earn from him five times as much for half au hour's trip on the water, with less expense. At Altoona, where an artificial lake of thirteen acres has been made, ten cents is paid by hundreds of delighted passengers for a trip around, lasting only seven minutes. Electrical boats are also being built now for regular ferriage, and a line is projected to ply between the smaller ports on the Gulf of Mexico. Some of the newer boats are of ample proportions, John Jacob Astor beiug the owner of one forty-six feet long.

If Soldiers Were Bullet-Proof.

If there is not some latent but fatal defect in Herr Dowe's system of making a soldier bullet-proof, the result of warfare will be a very remarkable one. Since the object of war is to kill, "to place *hors de combat*" is only a less crude way of putting the fact that new ways of killing infantry and cavalry will have to be devised. The chances of hitting men in the face at long distances with rifle fire will not be good enough. But the only ways of killing effectively that will remain open will be artillery fire, close combat with the bayonet and clubbed rifle, preferably the latter, as the cuirass will make the bayonet difficult to use with effect, and riding men down by cavalry charges. The first of these—artillery fire—has hitherto been regarded as of comparatively little importauce in the matter of killing. It is ofteu declared, indeed, that the chief effect produced by guns is the moral effect. Though not many are killed, men do not like to be within range of artillery. Possibly, however, the effect of artillery fire could be increased. In any case, and since everything is relative, the fact of the falling off of efficiency in rifle fire must increase the importance of artillery fire. It is obvious, however, that the chief effect of bullet-proof soldiers on the circumstances of a battle would be to increase enormously the amount of hand-to-hand fighting. But hand-to-hand fighting means an advantage to the strongest and most athletic force. Now, it will be seen from the bare enumeration of the changes which seem likely to follow bullet-proof soldiers, that a great advantage will be given to England.

Bullet-proof cuirasses will give an advautage to the nation which can only bring a small number of troops into the field. But that nation is England. It will increase the importance of artillery. But this should be in favor of England, for, though we have not the conscription, and so cannot get men in large quantities, we can manufacture as many guns as we choose. Next, the revival of close combat ought to be in our favor, for Englishmen are certainly better at the rough-and-tumble of close fighting than their neighbors. The infantry are naturally more handy and more athletic, and the cavalry are, if not theoretically better riders, more capable horsemen. An Englishman is more likely to get his horse to do the impossible than a Frenchman or a German.—English Ex.

Practical Information.

A Gun Manufactory in China.

Frank G. Carpenter, the noted traveler, in a recent letter from Shanghai, China, describes the government establishment for the manufacture of arms and munitions of war. Of the 2000 men here employed, only two are foreigners, and they are consulting engineers. At these works a number of twelve-inch guns have just been completed, and improved patterns of Armstrong rapid-firing guns are being made. In regard to the mechanical abilities of the Chinese workmen, Mr. Carpenter says:

Some of them are so expert that only general directions and the knowledge of the results required need be given them, and they will straightway make the designs and castings. I was shown one machine—I think it was for the rifling of some of the guns, though I am not sure as to this—which contained a screw of only three inches in diameter and thirty-five feet long, which was designed and cut by a Chinaman, and I took a time exposure of a yellow-faced Chinaman who makes the finest of the improved sights of the Armstrong guns. The work is as delicate and as beautiful as that of a watchmaker, and there is an improvement on the original, which this man has added. The rifling machine for the big guns would have cost $15,000 to import.

These Chinamen were shown drawings, and they made it for half that sum. It is so in nearly every variety of machinery, and among the things now actually being made in these works are all sorts of modern projectiles, from the revolver bullet up to great shots of steel weighing 1000 pounds. The steel works of this arsenal cover about four acres. The men are now experimenting in making ingots for armor plate, such as we turn out at Homestead, and they are putting in a steel furnace which will smelt fifteen tons of steel at one time. If it is a success they will add others. They have made some small ingots, and I saw steel rails for railroads which they turned out the other day to show the Chinese authorities that they could make them. They do all sorts of forging. They are now putting in a 700-ton steel press, which will exert a force of 2000 tons on the ore beneath it.

Up to this time China has been importing the raw material for her arsenals, but she is now experimenting with her own supplies, and the manufacturing China of the future will probably be entirely independent of the rest of the world. The coal and iron formations of the province of China are said to be the largest in the world, and the product is unsurpassed. The iron now used here comes from the province of Hunan, in about the center of China, and some idea of its character may be learned from a test which was recently made here. A shot was cast from this iron for a three-inch rifle, and it was fired against a target with the same charge and the same gun in competition with imported shot of steel.

The target consisted of three iron plates an inch thick, interleaved with boards of wood. The steel shots penetrated the target, but none of them went through it. The Chinese cast-iron shot passed clear through the target and was lost. The process of manufacture of the iron is not known at the arsenal, as it is shipped there in billets. The Chinese workmen excel in the manufacture of cast iron articles, as they make iron castings as large as an ordinary washtub, and have them only one-sixteenth of an inch thick.

Teaching Blind Girls to Cook.

A blind cook would seem to be an anomaly, yet Supt. Lyman Pease, of the Wisconsin School for the Blind, at Janesville, has of late demonstrated that blind girls cannot only be taught to prepare food in an appetizing way and by scientific methods, but they can also be taught the care and management of a stove and the use of kitchen utensils. A course in housekeeping has been one of the features of the school for some time, but cooking lessons have only recently been added to it. This was done not to make professional cooks of the girls, but because Mr. Pease, realizing how difficult it is to secure profitable employment for blind girls, thought it wise to teach them to be valuable assistants either in the kitchen of their own homes or in those of their friends. The girls use a wood stove instead of a gas or hard coal range, and, instead of having hot water boilers, they are required to keep the kettle filled and hot, as country housewives must. They are also taught to be exquisitely clean, and whenever they touch the stove or anything else that may soil the hands, they are obliged to wash them before going on with their culinary work. Knowing that the stove is a dangerous element in a kitchen where a blind girl is at work, particular attention has been paid to it in the course of lessons. The stove is not protected with guards, and the girls are required to learn by close attention and practice how to avoid any danger when making fires or working over the stove.—Milwaukee Journal.

Drying Mercury.

When mercury has been used in physical experiments or in gas analysis, says the *Scientific American*, it often becomes dirty and wet. If it becomes contaminated with zinc or lead, prolonged treatment with dilute nitric acid may be required to purify it. Washing with water has to be resorted to in such cases as these to remove all soluble impurities. Often in experimental work it gets wet with pure water. The drying of mercury in such cases is quite troublesome, unless time can be given to it. Where time is at the experimenter's disposal, the use of porous battery cups is highly to be recommended. The wet mercury is poured into one of these and is shaken about a little and left standing. The porous cup absorbs the water by capillarity, and it evaporates. In a few hours the mercury is perfectly dry. If no porous cup is at hand, the wet mercury may be poured into a tumbler and one or two pieces of thick blotting paper are thrust down between the mercury and the glass, so that several inches project above its surface. These act as described, absorbing by capillarity the water. This evaporates from the paper above the mercury. The meniscus of the metal tends to cause the water to settle down against the sides of the porous cup or against the paper, when it is at once absorbed.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 11, 1894.

No feature of the existing financial situation in all the principal commercial countries attracts greater attention than what is usually described as the glut of money. *Bradstreet's* reports that, as compared with this time a year ago, the Bank of England, for instance, holds specie to the amount of about $65,000,000 more than was in the vaults at this time last year. The reserves of the Bank of France are some $40,000,000 larger than in the autumn of 1893, and the increase in the holdings of the German Reichsbank are but little under that amount. The last report of the Associated Banks of New York displays an increase of $96,000,000 in cash reserves, and, in spite of the recent revival of demands for money, shows an idle surplus of nearly $60,000,000, while some $200,000,000 is lying useless in the Bank of England. Money, in short, is a drug; nor does the end of this situation seem to have been attained. The attempts, whether in London or New York, to institute a speculative movement which would furnish temporary employment for these accumulations have not thus far been successful, and developments of commercial activity and legitimate business in lines which, up to the moment, cannot be clearly foreseen, must furnish the outlet for all this unused and unproductive capital.

A statement issued by the Treasury Department, covering two-thirds of the month of September, shows that the customs receipts at the New York custom house for the first twenty days of this month amounted to $7,411,797, against $4,952,982 for the first twenty days of last month and $5,597,571 for the first twenty days of September, 1893. Still not one dollar of gold coin or gold certificates was received at the New York custom house during the first twenty days of September. The treasury gold reserve continues to grow slowly, however, and the fact that the receipts from importations are keeping up is naturally encouraging to the treasury officials.

Coin in the Sub-Treasury.

C. P. Berry, Assistant Treasurer of the United States at San Francisco, reports cash on hand in the Sub-Treasury at close of business on September 30, 1894, as follows:

United States Notes	$29,514.00
Treasury Notes, 1890	27,096.00
National Bank Notes	15,395.00
Gold Certificates	7,020.00

Mining Share Market.

SAN FRANCISCO, Oct. 11, 1894.

The market has not been as active for the past few days as it was last week. Transactions have been rather light, and no very marked fluctuations have occurred. Advices received yesterday report a fine showing in the winze below the 1700 level of the Con. Cal. & Va. It is also reported that there has been an increase of eighty men in the working force of the Gold Hill mines, fifty of whom have been put at work in the Crown Point and thirty in the Belcher, extracting ore.

The report from the Morgan mill for the month of September is as follows: The mill was in operation fifteen days, and during that time 1586 tons of ore were crushed, yielding bullion of the gross assay value of $83,879.60, of which $38,163.72 was gold and $45,715.88 was silver. The average yield of the ore in bullion per ton was $52.87, and the average assay value of the ore per battery samples was $59.24 per ton. The average assay value of the ore per railroad car samples was $57.89 per ton.

The following illustrates the changes of the week:

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCTOBER 2, 1894.

526,675.—EARTH SCRAPER—A. F. Beruard, San Luis Obispo, Cal.

526,676.—WHEELED SCRAPER—A. F. Bernard, San Luis Obispo, Cal.

526,677.—WHEELED SCRAPER—A. F. Bernard, San Luis Obispo, Cal.

527,011.—MORTISE LOCK—F. P. Burkhardt, Chelan, Wash.

526,969.—REFRIGERATOR CAR—C. S. Hardy, San Diego, Cal.

526,837.—GAS ENGINE—C. F. Hirsch, S. F.

526,972.—CHILD'S CARRIAGE—J. W. Jaimisou, Vallejo, Cal.

526,924.—DOOR BOLT—Jochmus & Boughton, Monterey, Cal.

526,925.—CAN MACHINE—Johusou & Black, Oakland, Cal.

526,787.—CHECK BOOK—Middlekauff & Aiken, S. F.

526,954.—RAILWAY JOINT BRIDGE—C. C. Wells, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes), $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

MINING SHAREHOLDERS' DIRECTORY.

Compiled Every Thursday from Advertisements in the Mining and Scientific Press and Other San Francisco Journals.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TAP OR FAUCET.—M. P. Schetzel, San Francisco. No. 526,327. Dated Sept. 18, 1894. The object of this invention is to provide a simple closing device for casks containing beer or other liquids, with an insertible, removable bushing, and a valve so closed, with relatiou to the bushing, as to allow the interior of the cask to be pitched without removing the bushing and valve, and, at the same time, to prevent any obstruction to the opening of the valve afterwards. It consists of a bushing adapted to be secured in a cask having a cylindrical outer chamber; an inner chamber of smaller diameter forming a shoulder between the two for the receptiou of an elastic washer; an interiorly projecting flange surrounding the inner chamber midway of its length; elastic washers seated upon opposite sides of said flange; a disk valve fitting the inner eud of the bushing and forming a seat upon the end of the bushing; a central stem projecting inwardly from the valve, having a cross fixed to its inner end which rests upon an elastic washer, so that the elasticity of the washer retains the valve normally closed; a faucet barrel having a longitudinally and diagonally connected slot formed in one side, adapted to move over a pin within the bushing, so that the turning of the faucet barrel in one direction will force the valve open, and, turning in the opposite direction, allows the elastic washer to close it.

SASH FASTENER.—James Seadler, Sacramento, Cal. No. 526,268. Dated Sept. 18, 1894. This invention relates to a check and lock for sliding sash screen, blind or other device, in which the weight and momentum of the moving appurtenances are utilized to operate upon the lock to hold it at any particular point, to prevent wrapping. It consists of a casing; a dog therein provided with a cam; a double-acting spring for holding the dog projected and retracted; a spindle for operating the dog; a chambered face-plate having an opening through which the spindle projects; a knob on the spindle; a toothed disk within the face-plate; a collar clamping the disk against the hub of the knob, and a sliding dog on the face-plate to engage the toothed disk and lock the spindle.

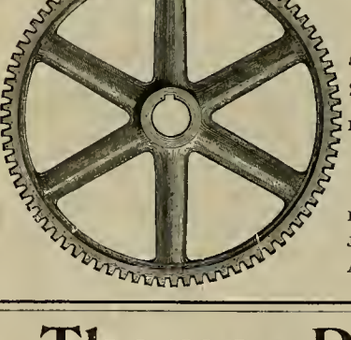
CURTAIN ATTACHMENT FOR WINDOWS.—J. M. Freeman, Oakland, Cal. No. 526,306. Dated Sept. 18, 1894. This invention relates to an attachment for windows for the support of curtains in such a manner that the curtain may either be moved with the sash or remaiu connected with the window frame, so that the sash may be moved independently of the curtain. It consists of a rod or sash from which the curtain is suspended, with plates upon which the ends of the shaft are journaled so as to be rotatable thereon, said plates having angular projections extending into channels between the window sash and the stop, so that they are slidable vertically and guided by the channels and hooks; and loops fixed respectively to the rod and shaft, so that the rod may be connected with the sash aud be movable up and down therewith or disengaged therefrom, to remain in position while the sash is moved independently.

EXPLOSIVE ENGINE.—Henry F. Fraser, Antioch, Cal. No. 526,348. Dated Sept. 18, 1894. This is a double acting explosive engine. It has a main cylinder with a single piston and an exhaust at each end. There is a compressiou cylinder at one side, having a single piston and an inlet for the charge at each end. The two cylinders communicate at each end by passages having valves. Betweeu the two cylinders are explosive chambers, exterior to both and located in the communicating passage. Within these chambers are the electrodes for affecting the explosion. These are normally separated and each is controlled by a spring. A pivoted lever has its free end adapted to contact with and withdraw one of the electrodes, whereby, upon said eleetrode being relieved, it will spring into contact with the opposing electrode and will be caused to instantly rebound and become normally separated therefrom.

HOISTING APPARATUS.—Louis Rosenfeld, New York. No. 526,263. Dated Sept. 18, 1894. The object of this apparatus is to hoist the load preliminarily to clear its immediate surroundings, and then to automatically and by the same continuous movement of the hoisting power hoist it outboard or sidewise to the point at which it can be dumped or lowered away. The apparatus consists of a support with guides located on each side, a double hoisting rope or cable directed from its bight to and by said guides and having its ends attached to the load receptacle, said cable or rope having in one of its sides an obstruction adapted to arrest the movement of that side at a predetermined point while the other side is still moving, and a hauling block in which the bight of the cable freely runs.

Back Files of this Paper Wanted. Send price, etc., to A. TUTHILL, 220 Market St., S. F.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Messrs. J. S. Gould and F. M. Spencer in the Holloway mine, near Gibsonville, Plumas Co., Cal., and to impound tailings behind log and brush dam in a ravine below the mine; from W. A. Morse in the Mugginsville mine, near Eureka North, Sierra Co., to impound tailings behind a crib dam in Eureka creek; and from John R. Jones in the Waukshaw mine, near Relief Hill, Nevada Co., to impound tailings behind rock dam in Logan canyon, gives notice that a meeting will be held at Room 82, Flood building, San Francisco, Cal., on October 29th, 1894, at 1:30 P. M.



Van Drake & Taylor,
MACHINISTS
—AND—
MECHANICAL ENGINEERS,
523 and 525 Mission Street, San Francisco, Cal.

SPUR, BEVEL AND WORM GEARS,
ANY SIZE, CUT TO ORDER,
FROM ONE-EIGHTH INCH TO FOUR FT. DIAMETER.

PATENT MODELS and Experimental Machinery of all kinds.
SHAFTING, PULLEYS and BOXES.
ENGINES and BOILERS.

DRAWINGS, PLANS and SPECIFICATIONS made for new machinery.
JOBBING of every description promptly attended to.
FINE WORKMANSHIP GUARANTEED.
Also Pacific Coast Agents for the SHARPLES CREAM SEPARATORS.

Thomas Price & Son,
Assay Office, Sampling Works
And Chemical Laboratory.
524 Sacramento Street, San Francisco, Cal.

NEW METHODS. **STORAGE BATTERIES.** NEW RESULTS.

THE HOUGH STORAGE BATTERY opens a new era in electrical development. We are now prepared to fill orders for complete plants for lighting or power. Residence lighting now an economical success. Stores, warehouses, mines, mills or street railways at reduced prices. Estimates furnished. Correspondence solicited.

EUREKA ELECTRIC CO.,
42 SPEAR STREET .. SAN FRANCISCO, CAL.

Double Acting Cornish Plunger

Pumps twice as much water as the old Cornish pump and "only one-third the weight."
SPECIAL CONSTRUCTION OF STEEL for packing on mules, only one-twelfth the weight of the ordinary Cornish Plunger.

IMPROVED SINKING PUMP.

Bucket and clack changed under water, saving expense of putting down another pump when the bucket or clack gives out under water. Bucket gearing lasts six times as long as the old gearing.
First outlay one-third less and works with ten per cent less power, "paying for itself in one or two years, according to the price of fuel."

WM. NANCE..... .....Grass Valley, Nevada County, California.

Send for Price List.

THE JONES ROCK DRILL

IS THE

Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, lessee, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

FRANK T. SUTHERLAND, M'g'r Pacific Coast Agency,
Office and Warerooms: 9 FREMONT St., San Francisco, Cal.
Or, Address the Company at its Denver Office.

FRANCIS SMITH & CO.,

—MANUFACTURERS OF—

SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

Adamantine Shoes and Dies

—AND—

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 220 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.

Stamp Cam.

UNION IRON WORKS,

CORNER FIRST AND MISSION STREETS, - - - - SAN FRANCISCO, CAL.

—MANUFACTURERS OF—

MINING AND MILLING MACHINERY,

Automatic Cut-Off Engines, High-Speed Engines, Hoisting Engines, Quartz Mills,
Manty Chill Mills, Rolls and Concentrating Machinery, Dodd Sigmoidal Water Wheel,
PUMPS--Cornish and Other, Copper and Lead Furnaces, All Classes of Marine Work.

SHIP BUILDERS. ★ BUILDERS OF U. S. WAR SHIPS. ★ HYDRAULIC LIFT DOCK.

PARKE & LACY COMPANY

21 AND 23 FREMONT STREET, SAN FRANCISCO, CAL.

MINE BELL SIGNALS.

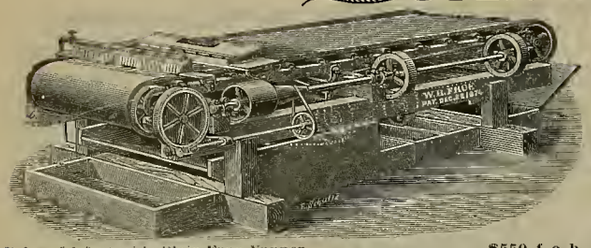
Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12 X 36 INCHES, THE MINE BELL SIGNALS AND RULES PROVIDED FOR IN the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market Street, San Francisco, Cal.

FRUE ORE CONCENTRATOR.

OVER 4000 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; March 31, 1891.



Price of 4-foot wide Plain Frue Vanner.....$550, f. o. b.
" " " Improved Belt Frue Vanner..... 700, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 700, f. o. b.

(Successor to ADAMS & CARTER,)
AGENT FOR THE
FRUE ORE CONCENTRATOR,
132 MARKET ST.,
San Francisco, Cal.

GLADSTONE MINING COMPANY, FRENCH GULCH, Shasta Co., Cal.,
C. J. Clark, M. E., Gen'l, Supt. Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to to mention. In order to give an idea of the work they are doing here, I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill.
C. J. CLARK, Gen'l Supt.

RISDON IRON WORKS.

Office and Works: Cor. Beale and Howard Sts., San Francisco.

Cable Address: "RISDON'S" San Francisco.

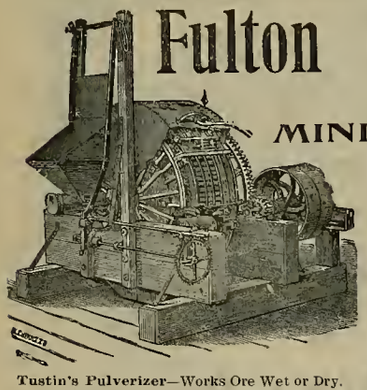
MANUFACTURERS OF

Johnston's Concentrator, Bryan Mills,
Challenge Ore Feeders, Air Compressors,

MINING, MILLING, PUMPING and HOISTING PLANTS.

Fulton Engineering and Ship-Building Works.

Successors to FULTON IRON WORKS (Hinckley, Spiers & Hayes), and F. A. HUNTINGTON.
Office and Branch Works, 213 First Street; Main Works, Harbor View, San Francisco, Cal.



Tustin's Pulverizer—Works Ore Wet or Dry.

MINING ✦ AND ✦ MILLING ✦ MACHINERY.

Adapted to every description of Mining and Milling.

Manufacturers of the TUSTIN PULVERIZER; adapted to Wet or Dry Crushing,

Also the well-known HUNTINGTON CENTRIFUGAL ROLLER QUARTZ MILL.

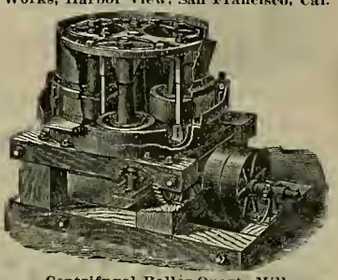
Special Descriptive Circulars of these Mills sent on application.

Specialties manufactured by us—"HUNTINGTON" BLAKE ROCK BREAKER; "FULTON" BLAKE ROCK BREAKER; FRUE VANNERS; "BOSS" CONTINUOUS SYSTEM.

Manufacturers of all kinds of ELECTRIC LIGHT AND ELECTRIC R. R. AND CABLE R. R. PLANTS. STEAM ENGINES—Plain Slide Valve, Corliss High Pressure, Corliss Compound Condensing and Non-Condensing.

Agents and manufacturers of the DE LA VERGNE REFRIGERATING MACHINES, FILTERS OF THE NEW YORK FILTER COMPANY.

Sole Agents for THE DEANE STEAM PUMP, ARMINGTON & SIMS ENGINES, LEFFEL WATER WHEELS.



Centrifugal Roller Quartz Mill.

THE ✦ PELTON ✦ WATER ✦ WHEEL!

—EMBRACING IN ITS VARIATIONS OF CONSTRUCTION AND APPLICATION—

THE PELTON SYSTEM OF POWER.

The most simple and efficient water power appliance for mining, electric or other service. Full and reliable information given regarding any proposed application upon receipt of the necessary data

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

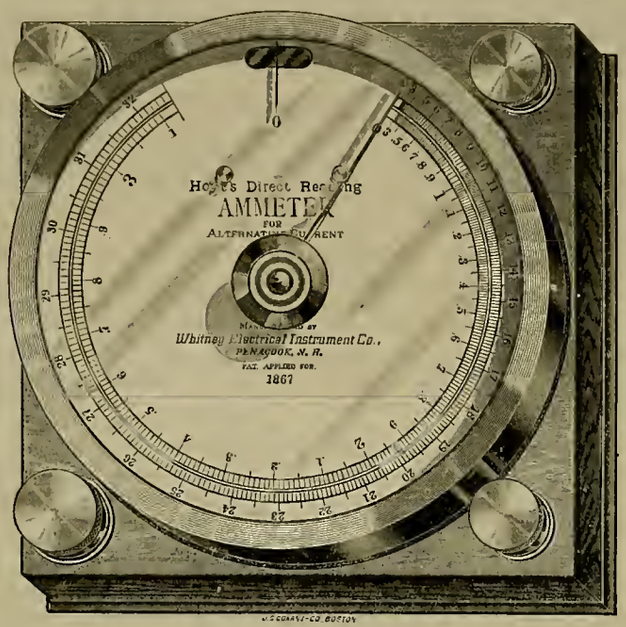
VOLUME LXIX. Number 16. SAN FRANCISCO, SATURDAY, OCTOBER 20, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Hoyt Ammeter.

Since alternating currents have come so generally into use for lighting purposes, electrical instrument manufacturers have been at work trying to devise accurate measuring instruments. The efforts of the Whitney Electrical Instrument Company have been crowned with success and they are now placing upon the market an instrument absolutely correct and reliable in every respect. One of the principal features of the above instrument is its adaptability to the reading of high or low currents. Lighting companies have long needed an instrument to take single lamp measurements. With the Hoyt ammeter they are readable to one one-thousandth of an ampere. This type of instrument is operated similar to the dynamometer but is direct reading, thus doing away with the necessary tables. It is on the principle of a balance, the armature acting against a double spring torsion.

A brief description of the method of taking the readiugs may be of interest.

The armature needle and index-pointer should stand at zero when the instrument is not in circuit. When the current to be measured is passed through the instrument there will be a deflection of the armature ueedle. To obtain a reading, turn the index-pointer until the armature needle is brought to zero, when the value will be indicated upon the scale by the index-pointer. These instruments may be seen at the California Electrical Works, No. 35 Market street. This house is the Whitney Electrical Instrument Company's agent for this coast.



THE HOYT AMMETER.

ST. PAUL, Minn., capitalists have purchased the Eagle, the Lane and other black-sand mines, near Coquille, Ogn., for a total of $70,000. These are all old claims which have been worked intermittently for years. A mill and other improvements, costing in the aggregate about $100,000, will be erected on the premises near the river, and work will be prosecuted at once and employment will be given to a large number of people. It is said careful tests of the sand have been made from time to time for more than a year past, and that the principal object of the work is not to get the gold but other metals in the sand, although the gold will be taken in. This will uudoubtedly stimulate matters and give a new impetus to black-sand mining in that section.

A Fine Combination Mill.

The accompanying plate illustrates a plant recently erected on the property of the Eureka Hill Company. at Eureka. Utah, and is described in the Salt Lake *Tribune* as the "best combination mill in the world." The structure rests on the hillside above the hoisting works of the mine, in eight benches or steps. Only on one of the benches was it deemed importaut to put in a retaining wall, and that was largely precautionary, because it was thought that the vibrations from forty stamps might possibly in time weaken this point, and hence a wall so solid that it cannot be shaken was placed there.

The visitor, of course, first reaches the boiler room, a large structure containing three separate uests of boilers of two each, so arranged as to use only part at any one time. Back of this are the large coal buuk ers, to be filled by means of a tramway extending from the railway below. Next, of course, comes the engine room, 40x40 feet, ceiled throughout, and which will be as neat as a parlor. The engine, of 350-horse power, is a compound, the high-pressure cylinder being 22x48 inches and the low-pressure cylinder 32x48 inches, with arrangements for condensing when desirable to do so. The twenty-foot diameter wheel, weighing 39,000 pounds, has eleven grooves for ropes, which will carry power to the line of shafting which is to drive all the machinery at the mill. In the engine room are the dynamos to generate electricity for lighting, etc. From the boiler room upwards extends the building a distance of 240 feet, with a rise from bottom below to top of ore house of 144 feet, while the building is 180 feet across in the other direction, making a very large structure. Still above this is the salt house. In operation, ore will be hauled to the highest part of the mill by means of double tramway, extending from the mine hoist 850 feet, with a rise of about 300

(*Continued on page 244.*)

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 254.

THE first pure copper ever sent from Utah was shipped last week to Chicago and Pittsburg. The amount was 61,832 pounds, and is the first product of the new copper plant. Of copper matte the shipments last week were 130,950 pounds.

THE placer gold fields of the Cape Horn country seem to be identical in nature with the ocean-beach sand diggings of the California coast. The gold is all found in the black sand in small particles, and the patches along the beach are soon worked out. The men wait for bad weather and a heavy surf, after which fresh layers of black sand bearing gold are found. No settlements have sprung up on the shores of Tierra del Fuego, as the diggings are soon exhausted and the men move from beach to beach.

Notice of Good Faith.

It will be remembered that in July last Congress passed a bill suspending for the year 1894 the provisions of the Revised Statutes which require that $100 worth of labor per annum shall be performed or improvements made on mining claims.

By filing with the proper recorder a notice that the claimant intends to hold and work his claim in good faith he is exempted from the annual assessment work this year. This "notice of good faith" virtually takes the place of the assessment work, but it must be given in writing and filed before the end of 1894. Those who neglect to make and file the notice endanger the title to their claims.

The California Miners' Association, through its Secretary, Mr. Wm. C. Ralston of this city, has issued a blank form of this notice, which is in compliance with the law and is as follows:

NOTICE OF GOOD FAITH.

Notice is hereby given that the undersigned owner.. of —— certain mining claim or location— known as and called the ——, situated in the —— Mining District, in the county of ——, State of ——, being desirous of taking the benefit of the Act of Congress entitled "An Act to amend Section numbered Twenty-three Hundred and Twenty-four of the Revised Statutes of the United States relating to Mining Claims," approved July 18, 1894, hereby declare.. that —— in good faith intend.. to hold and work said claim...

Dated —— A. D. 1894.

It is a very simple matter to make out and sign this form and file it with the district recorder or recorder of the county in which the mine is situated, and the mine owner is thereupon released from doing the assessment work. But as stated, the filing of such a notice is requisite and should be promptly attended to by all claim owners.

California Gold Mines.

Reports from Arizona, Colorado, Montana, Oregon and other mining sections all indicate a material increase of the gold product this year over that of 1893. This was only to be expected when so many miners had to give up operating in silver and turn their attention to prospecting for and developing gold properties. It shows, too, that the injection of capital into this branch of the mining industry was all that was needed to impart activity. Mine investors are not looking in these days for silver, silver-lead or copper claims, but they are all in search of gold.

Whatever may be the claims of other States with respect to their gold output, none of them have ever yet been able to equal that of California—the Golden State. Ever since the discovery at Sutter's mill, this State has led all others in the production of the yellow metal, and it so continues to-day. The close of the present year will show the same comparative record, as, while others are increasing their output, California is doing the same. It has the advantage of by far the most extended gold fields in the United States, and the greatest variety of sources of gold. It is found to a greater or less degree in nearly all of the fifty-seven counties of the State. The mountain, valley and coast counties all yield it in some form.

Gold mines are worked in the extreme north, extreme south, in the high Sierras and on the coast. It is found in sections rich in agricultural resources, and upon the barren deserts. The glacier-crushed rocks of the mountain peaks and the sands of the ocean beach reward the search of the patient miner.

Gold is found in California, not only in the quartz rock, but in vast beds of gravel which underlie the old red hills, and which are only partially touched as yet. In quartz, hydraulic and drift mines, river bars, river benches, river beds, dry creeks, wet and dry placers, sea-beach sands, and in fact in whatever way gold is found, so it is found in California.

Some of the other States, and notably Colorado, have had the advantage of California in their abundance of capital in mining enterprise. And, moreover, the people there understand the advantage of advertising their mineral resources. In our own State the policy has generally been to keep very quiet indeed about the producing mines, and very little is made public concerning them. The greatest gold mine in the United States—the Utica of Calaveras county, California—is scarcely heard of publicly even here, much less outside our borders.

The reason for this seeming lack of enterprise is that our gold mines are never stock operations. The stocks of our gold mines are not sold in open market, and the stock exchanges know them not. The mines are owned and operated by individuals or private corporations, who keep their business to themselves. They have no reason to herald rich strikes or amount of product, and endeavor to conceal rather than publish the result of operations.

This may be a mistaken policy as far as the general advancement of the mining industry is concerned, but it is one long followed in this State. Even in the famous days of mining-stock excitements in San Francisco, when millions changed hands in a day, not more than a dozen of the gold mines of this State were dealt in at the stock exchange. The transactions were all in silver stocks. When the brokers not long since offered to list gold properties free at the stock exchange, there were not more than half a dozen mines which took advantage of the opportunity. From this it will be seen that our gold mining in California is conducted rather as a legitimate business proposition than as a speculation. We have been in this branch of the business so long that its details have been thoroughly mastered, and all the economies are recognized and practiced.

While there are very many developed gold mines, there are yet in this State thousands of prospects or undeveloped claims needing capital to make mines of them. People cannot come here and find the mine they want in a week, nor can they buy it for a song, but those with money to invest in gold mining, and who are looking for properties, can do better in California to-day than they can in any other State in the Union.

California Petroleum.

The recent strike of oil at Los Angeles emphasizes the growing importance of the petroleum industry of California. There are now about seventy wells in the Second-street district of that city, with an estimated output of 500 barrels a day. The largest output of any one well is thirty barrels per day, and the average about eight barrels. It is not at all likely that this is a mere local isolated deposit, but it is probably part of the oil belt which runs from Ventura county to Puente. The oil-bearing territory of the region is now being investigated, under the direction of J. J. Crawford, State Mineralogist, by Mr. W. L. Watts, field assistant of the State Mining Bureau, author of the recently published bulletin on the petroleum-bearing formation of the central valley of California.

There are several oil belts in this State, but the one most largely developed and the greatest in point of production is that beginning in Santa Barbara county and continuing through Ventura and Los Angeles counties. It is on this belt that the wells of Newhall, Los Angeles city and Puente are situated. The most important of the districts are the Santa Paula region, in which are found the Ojai, Sespe, Ex-Mission (which includes the Adams and other districts), the Torrey canyon in the San Fernando mountains, twenty-two miles west of Newhall, the San Fernando district, including the Pico, Wiley and Elsmere fields, and the Puente district, in which only one field, the Puente, is found. The wells in the Santa Paula sub-district of these southern fields are in Ventura county; the Puente and Pico districts are in Los Angeles county.

There is an oil field in Humboldt county, but practically no development has been made; and the same may be said of that in Kern county. Another field is in Santa Clara, San Mateo and Santa Cruz, extending along the coast into Monterey and San Luis Obispo, and thence over the Coast Range into Fresno and Kern counties. It will be seen that, though oil has been found in many other parts of the State, the fields where it is obtained in merchantable qualities are mainly confined to the southern counties.

The petroleum fields of California are the most interesting in the United States, differing, as they do in many respects, entirely from other fields yet opened. The oil, with the exception of that from Santa Clara, and one or two isolated wells, has usually as its base, asphaltum, instead of paraffine. The strata in which the oil is found are tilted at a high angle. Drilling is difficult and expensive, owing to the character of the rock and the angle at which the oil-bearing strata stand. The oil, while carrying but a small proportion of the illuminating hydrocarbons, finds a ready market as fuel, owing to the high price of coal here, and contains practically no sediment.

California now stands seventh among the list of oil producing States of the Union, being exceeded in annual product by Pennsylvania, Ohio, West Virginia, New York, Indiana and Colorado. In 1889 it was fourth in rank of production, but other States have exceeded it since. The production in this State last year was 470,179 barrels, valued at $608,092, which was larger than any year since 1888, when it was 695,333 barrels. The total production of this State since 1875 has been 4,769,450 barrels.

Our present production, however, is not sufficient to meet the demand for fuel, and considerable is brought from Peru. The addition of the product of the new oil field at Los Angeles city, while gratifying, can be readily consumed locally, no doubt, and will aid the manufacturing interests of that place. As petroleum becomes more abundant and cheaper, it will still more greatly take the place of coal as fuel, and an abundant supply is needed on this coast. The discoveries at Los Angeles will doubtless lead to further prospecting for oil in that and adjacent regions, where there is a good field for such operations. The discovery at this point is the most important thing which has happened in connection with the mineral history of California this year.

THE grub-staked miners who have been out in the hills all summer are now returning to the camps for the winter. They all have half a dozen or more prospects on which they will begin work in earnest in the spring.

Co-operative Mining.

Mr. Huntly, of the Morning mine, near Mullan, Idaho, has taken his workmen into partnership, in a measure, and there is considerable interest in seeing how the proposition will work. The mine is to be worked on the co-operative plan.

By the terms of the lease twenty-five per cent of the net proceeds of the ore or concentrates produced goes as a royalty to the Morning Mining and Milling Company, who will pay all taxes, insurance, legal expenses, Milwaukee office expenses, assessment work, and all special improvements, new buildings and mine development work. The remaining seventy-five per cent of the proceeds of ore or concentrates will be used as follows:

First—To pay the company $1300 monthly toward expenses of mine development. But the ore mined by the company in doing development work will not be kept separate, but go with the other without extra charge.

Second—To pay operating expenses of mill, railroad, office and general repairs to mill and railroad machinery.

Third—The remainder shall be divided among the lessee and the entire undergrouud, surface and tramway mine force in proportion to the number of days each has worked, and according to the class of labor to which each belongs. The division shall be so made that carmen, shovelers aud general surface laborers shall receive five-sixths as much per shift as a miner.

Blacksmiths, carpenters and head timbermen shall receive one aud one-sixth as much as miners per shift. Shift bosses shall receive one and one-half as much as miners. The foreman shall receive twice as much as miners. The manager and lessee shall receive two and one-half times as much as miners.

Provision is made that the mine shall not be "gouged," but shall he timbered, stoped and worked in the ordinary way. In the agreement there are arrangements for settling the amount due to men leaving or who may be discharged. Men can hoard and trade where they please. A committee of three on behalf of the men is to have facilities for inspecting the hooks. The men are required to sign an agreement releasing the lessee from claims for damage from iujuries, and also to accept as full pay their proportioned shares of the month's receipts.

For a fully developed mine that will pay steadily, this plau of Mr. Huntly's may work all right. It is doubtful, however, how far it would he carried out, unless operations were at once profitable. Men would not care to do much mere prospecting or developing work on such a hasis. Still, Mr. Huntly's experiment in starting up the mine again on this new system will be watched with interest.

A Great Tunnel Completed.

A notable piece of miuing work was brought to completion at Park City, Utah, last week after over six years of constant labor. This is the Ontario drain tunnel, which will drain the Ontario, Daly and Daly West mines, with which it has direct counection. It is expected that it will also reduce the water in the Silver King and other properties. The flow through the tunnel before its connectiou was made last week was about 13,000 gallons per miuute. As soon as the cleaning up is all done the great Cornish pump will he stopped, aud all the water will flow through the tunnel. The mines are capped at a depth of 1500 feet.

This tunnel is 15,490 feet long and it took six years and three months to run it. The average cutting per day was six aud three-fourths feet. The completion of this tunnel will effect an enormous reduction in the operating expenses of the mines. The great Cornish pumpiug plant, which represents an outlay of nearly $500,000, will now he stopped, and no fuel will be required except for hoisting. It is estimated that the cost of ore production will be reduced about $5 per ton. On the basis of last year's production—56,000 tons from the Ontario and Daly—this would effect a saving of $280,000 and the tunnel would more than pay for itself in two years. Add to this saving the amount that has been expended yearly in the tunnel and it will be seen that the mines will be in a position to resume dividends. The mines will continue to be worked notwithstanding the low price of silver.

Concentrates.

THE Red Rover mine, at Acton, is working twelve men.

THE plant at the Good Hope miae, Perris, is to he increased.

THE Zirn claim at Pine Nut, Nev., is producing considerable gold.

Two gasoline hoists are in operation ia Pinacate district, in southern California.

BRITISH COLUMBIA wants a Mining Bureau so as to advertise its mining resources.

THE Homestake mine, in the Black Hills, has eight year's supply of ore for its mill in sight.

CRIPPLE CREEK, Colorado's best gold camp, is turning out over half a million dollars a month.

SOME forty claims have been taken up for "quicksilver" a few miles west of Perris, Riverside county.

A PYRITIC smelter is to be erected at Kennedy, Nev.; the site has been selected opposite the Imperial mill.

THE Morning Star gravel mine of Iowa Hill, Placer county, has declared its forty-sixth dividend of $1.50 per share.

IF the work now intended is carried out, there will be 250 more stamps next summer in the vicinity of Juneau, Alaska.

SOME of the principal owners of the Mercur mine, Utah, are negotiating for a gold property in Siskiyou county, this State.

MONTANA papers claim that the product of gold from that State this year will he seventy-five per cent over that of 1893.

THE Needles Reduction Works have been attached for $28,000 by the Nevada Bank of San Francisco. The mill has been idle for several months.

MINING ASSESSMENTS delinquent this month amount to $136,000, of which Nevada mines call for $102,000, California mines $4000 and Arizona mines $30,000.

CHLORIDERS in and around the Julian and Banner districts, San Diego Co., are keeping twenty stamps in two custom mills dropping on ore averaging from ten to forty dollars per ton.

AT Ogilby district, San Diego county, water is pumped from the Colorado river, twelve miles distant. The Golden Cross mine has a large body of ore, which is quarried out, and is paying well.

MANDERVILLE & RICHARD are running a tunnel to tap a channel about a mile northwest of the Metcalf mill, near Nelson Point, Plumas Co. It will require about 350 feet of tunnel to do the work.

ADVICES from Cooks Inlet, Alaska, indicate an increased output of gold from the heach sands in that vicinity. There are also rumors that another stamp mill will be erected there the coming summer.

HENRY COOK, of the Silver Cloud mine, Dragoon mountains, A. T., has ordered a one-stamp mill for use in crushing the ore and a horse-power to run it. He expects to crush two tons per day with the mill, which he can concentrate.

A GUTTENBURG mill has lately been put in at the Golden Rule quartz mine on Horseshoe Bar, south of Newcastle, Placer Co. A 300-foot drift has been run, twelve men are employed, and the rock is being milled with good results.

T. P. MOUNTER, formerly of Sierra City, has been appointed at the Nevada City mine, at Nevada City, to take the place of T. J. Benney, who has been appointed superintendent of the Contact mine, otherwise known as the Live Yankee.

THE gold mines at Deep Creek, Utah, are operated very slowly, as they are so far from railroad connections at present that costs are quite heavy. There is also great scarcity of water. There are five mills, but only water enough for three.

CAPTAIN MILES STANDISH of Salt Lake has purchased the Placer Basin group near Seven Devils, Washington county, Idahe, for $150,000. The property consists of four quartz claims owned hy E. M. Barton, J. A. Dimick and Harry Siskrow.

T. A. STARRH, lessee of the Star mine, Wood River, Idaho, has made a good strike in the lowest working level of the mine. The vein showed eleven inches of solid galena, judged hy miners working there to he worth hetween $300 and $500 per ton.

DURING the month of Septemher the price of copper advauced nearly half a cent per pound, aud the market closed firm at the advance. Exports were somewhat larger than in August; production about the same, while home consumption is considered good.

THE Mercur Mining Co. of Utah are making extensive improvements at their mill. The machinery for the new mill and the more extensive leaching tanks are in the East ready for shipment, as soon as the company finds that it will be in shape to put them up.

MR. GRAY, superintendent of the Gladstoue mine, French Guleh, Shasta Co., is trying to settle up the affairs of the company. The Union Iron Works put on the last attachment. It is said that the stockholders have decided to start the mill and mine again.

EVERY report from the South African gold fields is to the effect that so far as concerniug men who work for wages, that country is a poor place for white men. Native labor is so very cheap, and many men who have gone to South Africa in search of work at living wages are reported destitute and desirous of getting away.

SOME of the largest gold nuggets ever sold to the Citizens' Bank were hrought to Nevada City the other day. The lumps were irregular in shape and varied in size, some of them heing over two inches long and a half-inch thick. There were over $300 worth of the nuggets and they were taken from a gravel mine above Washington.

IT is estimated that the act of Congress, suspending for the years 1893 and 1894 the clause in the United States mining statutes requiring $100 worth of labor to be performed annually on unpatented mining locations, has resulted in a saving of more than $10,000,000 to the owners of such claims in the various silver-producing States and Territories.

THE superintendent's report of the Homestako mine, Black Hills, for the fiscal year ending Juue 1, 1894, shows the total net proceeds to have been $1,489,961.18. Of this, $1,372,669.35 was from hullion, $17,944.27 from concentrates and $99,350.56 from ether sources. The dishursements aggregate $1,162,744.55. Of this amount, $811,499.63 was paid out for labor and $181,250 in dividends to the stockholders. For the purchase of mining properties during the year $103,780 was expended. The item of taxes foots up $20,012.74, $7,403.25 represents the cost of candles, while the item of powder foots up $38,879.07. The company started the new year with the comfortable balance of $327,216.63 cash on hand.

AT the annual meeting of the Mayflower Gravel Mining Co. of Placer county, the following officers were elected: F. Chappelet, president; H. F. Green, vice-president, and Chas. Mayne. F. W. Zeile and H. Bendel, directors. D. M. Kent was re-elected secretary. A dividend of ten cents a share was declared and the annual statement shows a credit of $29,000.

ADVICES from New York say that the sale of the Lost Confidence mine at Iron Mountain, Shasta Co., is an assured fact. Immense reduction works, having a capacity of 4000 tons per day, will be erected near Copley, and seven miles of narrow gauge track will connect the mine with the railroad. Although the distance is but three miles the grade will be 350 feet to the mile.

THE board of directors of the Bullion-Beck Mining Company of Utah held a meeting and by unanimous vote rejected a proposition from the Almo Mining Company to compromise the suit recently instituted by it, praying judgment in the sum of $100,000. The Almo Company's claim is that its lines have been invaded and ore of the value of $100,000 mined from it. The Bullion-Beck people deny this.

THE Dayton *Times* says that the Ninety-Four Company of Dayton has put up a horse-power hoisting apparatus for the power of raising the gravel from their shaft. This will enable the company to handle the material more rapidly than hoisting by band. The company has taken hold of a lot more placer ground that has been lying idle for many years and is making wages out of it now for eight or ten men.

THE rich find of mineral at Salina, Levier Co., Utah, is attracting considerable attention, though some are inclined to be skeptical concerning it. A great many claims have been taken up, and the locators are sanguine of good results. The ore is in sandstone, in the shape of carbonates, and is very rich in copper and lead, with a small per cent of silver. Of course this is only what the surface croppings indicate, and to get at the direct proposition much development work must be done. There are many who think that Salina is on the eve of a great awakening, and that another Silver Reef has been discovered. The discoveries are four miles east of Salina, near the mouth of Soldier canyon.

ANOTHER factor in the prosperity of the town is the cyanide process of working tailings. The plant put up by the Standard for this purpose is going right ahead with its work, and the results are said to be entirely satisfactory. A conservative estimate would place the amount of available tailings in the town at 100,000 tons, and an average valae of $5 per ton would not be a high figure. If, as is claimed, an extraction of from 80 to 90 per cent can be obtained by the cyanide process, it can he readily seen that there is a lot of money in these tailings alone. The Standard tailings mill has a capacity of 100 tons daily. J. S. Cain, A. J. McCone and A. Soderling, who own between 40,000 and 50,000 tons of tailings on Booker Flat, will probably put up a plant to work them next spring.—Bodie Miner.

JOHN MCCUSH, Billy Bughee, George Martin, O. E. Nash and Wm. Jackson are interested in a gravel prospect across the river from Redding, on land owned by Martin, and just above the Hudson & Martin ranch. For some time McCush and Bugbee have been pushing a tunnel through cement and sandstone, and are now in 175 feet, and making an upraise to an old shaft. There is known to be an old river channel heneath the lava formation on top, and gravel in the shaft prospects a cent to the pan. It is expected that after making twenty-five to thirty feet on their upraise they will strike this hed of gravel. Just how deep it is is not known, but once in the river channel it is hoped that good pay can be had by drifting. A short time will demonstrate how good the prospect is.—Redding Free Press.

Personal.

J. A. AND A. S. CAMERON are looking at mining properties in the White Hills, A. T.

CHAS. A. PEACH, of the Marguerite miue, near Auburn, has gone East ou a business trip.

ROSS E. BROWNE returned to this city this week after an extended trip on mining business.

LOUIS FALKENAU, the well-known assayer, has removed from the Safe Deposit building to his new office, 434 California street.

LOUIS JANIN JR. left this city this week for Australia, where he will remain a few months and then extend his trip to the South African gold fields.

J. M. B. PERRY, the metallurgist of Aspen, Col., has brought five miuers from Leadville and is to work the mines at Chloride, A. T., purchased from Stephen Smith.

C. S. BATTERMAN, mining engineer, and C. S. McHenry, both of Aspen, Colo., are in Alaska making an inspection of the various available mining properties in the vicinity of Juneau.

ON Monday evening a dinner was given at the University Club in this city to Director Wolcott of the U. S. Geological Survey. Among the guests were President Kellogg and Professors Le Conte, Hilgard, Bacon, Christy and Lawson of the University of California, State Mineralogist J. J. Crawford, Louis Janin Sr., Louis Janin Jr., Jno. L. Howard of the Oregon Improvement Co., Chas. G. Yale and Sidney V. Smith. Mr. Wolcott lectured at the Stanford University on Tuesday evening and left on Wednesday for Portland on his way back to Washington.

MR. WHITFIELD PRICE PRESSINGER, whose brochure on the "Widening Use of Compressed Air," issued a few months since, was so extensively noticed by the engineering and scientific press, has just returned from a visit to Europe. Mr. Pressinger is connected with the Clayton Air Compressor Works, New York, and although he went abroad solely for recreation, he did not fail to avail himself of every opportunity offered of studying the air compressor practice of the larger cities of the old world, and while in Paris had an extended interview with Mr. Victor Popp, president of the Paris Compressed Air Power System.

A Fine Combination Mill.

(*Continued from page 241.*)

feet. On reaching this floor the ore is thrown into the largest size Comet crushers, through which it passes and drops into the large ore bin ready to be run down into the self-feeders and on into the batteries.

The eight batteries are of the most massive and best design made, while the forty stamps weigh 850 pounds each. These batteries have single discharge from which the wet pulp runs over silver plates, where most of the gold is caught and saved by quicksilver. From the plates the pulp runs to the twenty-four six-foot Frue vanners, which save the concentrates ready for market or for further reduction in the mill. The tailings here go to the numerous sand-tanks, where the water is drained off. After this comes the work of twenty-four amalgamating pans and twelve settlers, which perfect the treatment of ore, after which it goes to the tailings dump. A mill of this class and capacity, built in the most substantial manner, is no small affair, especially when of the best of materials and the latest and most substantial machinery. The mill site occupies nearly six acres, and besides the mill there are other buildings and features of interest. The blacksmith shop stands by itself away from the mill, as does also the milling-room, assay office, two retorts, etc., in a building 30x40 feet, part of which is two stories, the upper one being used for storage of assay supplies, etc. At a convenient point a fine eight-room residence for the superintendent has been erected.

To operate such a mill requires a large amount of water. Tintic district in the past has suffered much because of the scarcity of water for all purposes. The Eureka Hill Mining Company was fortunate in securing an ample supply at Homansville. To get this to the mill required the putting in of powerful pumping machinery to send water through nearly 20,000 feet of six-inch pipe, with a rise of about 500 feet. To pump water that distance and maintain an ample supply at the mill at all times, made it expedient that there should be large tankage at the mill. A reservoir to hold 600,000 gallons is being constructed. A deep excavation has been made for this purpose. On the upper side the conglomerate is firm enough for this purpose and will be simply covered with cement while heavy walls are being put in on the lower side. Such are the more important details of this newest and best combination mill in Utah, and which will be in full operation in a few weeks. It was built by Fraser & Chalmers of Chicago.

The Coal Deposits in Washington.

The magnitude of the coal deposits in the State of Washington is little realized away from the Pacific coast. Not all the Atlantic States combined contain such a supply. Workable veins are known to exist in eighteen out of thirty-four counties, and they cover an area of more than 1,000,000 acres. The coal ranges in character from cannel to semi-anthracite, through all grades of domestic, gas, steaming, cooking and smithing coals. With the exception of the Roslyn mines in Kittitas county, the productive measures lie west of the Cascade range. They are all lignite and bituminous. Anthracite has been found in the Olympics and in the Cascades, and there is a fine deposit at the base of Mount Rainier. These, however, have not been developed sufficiently to judge of their values. The lignite measures extend from British Columbia on the north to the Columbia river, and east from Puget Sound fifteen miles. The area covered is estimated at 800,000 acres. Less than two per cent of it is owned by companies prepared to open up veins as soon as the market is ready for the output.

Grant's Pass Gold.

A Grants Pass man well versed in our resources estimates our annual output of gold at $500,000. As most of our mines are owned here this money stays amongst us and helps everybody in the community. It is lucky in these times of depression to be able to export something which does not depreciate and which adds to the world's wealth without making any individual in it poorer. This half a million of dollars is a conservative estimate. Our gold, unlike other products, goes out silently and secretly. No string of freight cars is necessary to haul it away; no great hurrah is ever made by the miner as he brings in his dust to sell in the city or express direct to the mint. For obvious reasons those interested in gold dust withhold information as to the amount of exportation or means of sending it away, but the many channels of outgo have been carefully figured and the result is at least a cold half million a year.—Rogue River Courier.

Eisleben, the birthplace of Martin Luther, is sinking into the moor upon which it is built. Measures have been taken in recent years to drain the bog without avail, and the inhabitants are seriously thinking of abandoning the town.

The Genesis of Gold Placers.

NUMBER II.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by R. L. Dunn, M. E.

Very fine gold that can float in a moderate velocity of current of water is rarely concentrated to an extent compared with coarse gold, but considerable amounts of it accumulate with the stream drift during accumulation periods. Hardly appreciable even to the cubic yard, yet this fine gold amounts to an enormous aggregate when the tremendous masses of the drift accumulations are considered. In the cutting periods this fine gold is moved on with the mass of drift, very little of it getting down to the bedrock and remaining there with the coarse gold.

Primarily the formation of the placers is due to sub-aerial denudation and erosion. In the end this formation is more or less modified by the action of forces acting from the earth's interior. These last find their expression in regional elevation and regional subsidence and in the direct covering up of the sub-aerially formed placers by lavas and other volcanic flows. Except as to the last noted, the influence of these interior forces is apt to be unsuspected, even where it is very considerable. Many placers that would, under sub-aerial conditions alone, be temporary unconsolidated formations, become relatively permanent as a result of the action of the earth's interior forces. In its simplest form the placer is an unconsolidated formation of the existing geological period, and such placers have been formed in every geological period of the earth's history during which there was a sub-aerial erosion of auriferous lodes. Such remains of these geologically ancient placers as have been discovered and identified, owe their preservation and more or less altered condition to the action of the earth's interior forces, and it has become necessary to broaden the significance of the term "placer" to include them. The auriferous region of California contains within it examples of placers of several geological periods in several conditions of modification of situs and character by reason of the action of the interior forces.

The placers of the "Recent" existing geological period consist of the deposits made in the direct formation of the existing stream basins by sub-aerial erosion. These are the present stream beds and sections of older beds of the same streams commonly known among the miners as bar and bench placers. Their gold content has been derived not only from the direct disintegration of auriferous lodes in place, but from the secondary erosion of the placer deposits of preceding geological periods. Generally speaking they are shallow deposits and very rarely even cemented. As a rule they are readily distinguishable from older placer formations by their relative position alone. There are, however, some unconsolidated shallow placer deposits of limited extent in Siskiyou and Trinity counties high up on the summits of the mountain ranges, which seemingly ought to be of "Recent" origin, yet on that hypothesis the manner of their formation is hardly comprehensible. The fact is, that despite superficial appearance, they are not of "Recent" origin, but are very likely the fragmentary remains of stream channels of Tertiary, or even greater, age. Their apparently inexplicable position is due to a considerable regional uplifting, which has at the same time protected them from complete obliteration by the general denudation and erosion of the Post-Tertiary age.

The old channel placers proper of the Sierras are of Tertiary age, Miocene and Pliocene. While sometimes found unconsolidated, they are more frequently lightly cemented and occasionally so compacted as to be a conglomerate. They have been protected from denudation and erosion both directly by being covered by enormous masses of later tertiary and quartenary lava and other volcanic flows, and indirectly by the subsequent regional uplift of the same geological period. This latter has had the effect of minimizing the denudation and erosion on the higher portions of the surface, very generally the lava filled old stream channels, and of concentrating and intensifying denudation and erosion in the lower portions of the surface, the channels of the existing streams. To these conditions is very largely due the table land and canyon topography so characteristic of the Sierras. To this regional uplift is also due the preservation in part, at least, of the bars and benches of the existing streams. Also it is the explanation of the otherwise inexplicable gradients of many of the tertiary channels as determined in the course of mining operations. The axis of the uplift being north of the channel region, the effect has been that wherever the flow of the old channel was northward the original downward grade has been flattened and even reversed in some instances, and wherever the flow was southward the grade has been increased. This phenomena has been very clearly elucidated by Waldmar Lingren, Field Assistant, United States Geological Survey, in a paper entitled, "Two Neocene Rivers of California," (Bulletin Geological Society of America, Vol. IV). The Tertiary placers are generally considered to be the stream accumulations of Miocene and Pliocene rivers, and there are evidences of some of them being older than the miocene (Cretaceous), and others more recent than the Pliocene, (Quartenary). The fact that the geological evidence is conclusive as to the Sierra region not having been below the sea since the Jurassic period would sustain the presumption of Cretaceous or Eocene origin to some of the placer deposits. The period of lava flows and channel obliteration by volcanic action, not of one system of channels, but of several systems of channels formed successively in the intervals of quiescence of the volcanic activity, extending into the Quartenary period would bring the probable formation of some of the placers as late as that period. It is notable that all these Tertiary, lava-filled channels are not auriferous, but the evidence that the channels of any particular system of the several were not auriferous as a distinctive characteristic is not conclusive. What have been termed "Cement Channels," being channels in which the lava comes in direct contact with the bedrock, without a stratum of auriferous gravel between, are not necessarily the channels of one particular system, but may be, and doubtless are, portions of the channels of all the systems. The absence of gold would indicate that that particular channel made no primary erosion of auriferous lodes above the point being examined, but would not necessarily be conclusive that it was not at some point above auriferous by reason of its erosion of the unconsolidated drift of some older channel. The fact that the gold in the older deposit was free would preclude its being moved very far in the second erosion.

The two described classes of placer deposits, those of the existing streams and those of the Tertiary streams, were long since identified, and the literature regarding them is extensive and accurate. It has been quite generally assumed that they include all of the placer deposits of California. Only during the last two years has this been disproved. There are, in fact, two additional distinctive classes of placer deposits considered both with reference to occurrence and geological origin. The writer, for the California State Mining Bureau, in 1893 made an extended examination of and a report on a peculiar conglomerated auriferous gravel deposit in Siskiyou county. (Unpublished, but will appear in the January, 1895, report.) This deposit proved to be the gravel-filled bed of a Cretaceous or possibly even Jurassic river. This conglomerated gravel bed lies unconformably in a depression of the older metamorphic rocks and is conformably covered with sandstones, identifiable as belonging to the Chico group of Cretaceous sediments. These sandstones in turn are capped with basaltic lavas, part of the flows of the later volcanic activity of Quartenary times. The conglomerate is exposed by the recent erosion which has swept away the lava and upturned edges of the tilted sandstones, and which has cut out and broken up some of the conglomerate—sufficient of the latter, indeed, to furnish an enormous amount of gold to a small area of shallow placers in the vicinity of Henley and to the Klamath river for twenty miles below where the old channel deposit was cut. Though this old channel has been deformed by tilting, the distribution of the gold is identical with the distribution found in existing and Tertiary channels. It is coarse, heavy channel gold, waterworn and free from quartz. The explanation of the unusual phenomena of occurrence of this deposit is not difficult, once the geological changes that have taken place in the locality are comprehended. The United States Geological Survey has covered the Cretaceous formations of northern California pretty thoroughly. From the publications of Mr. Diller, who had charge of most of the work in that section, it appears that the stratigraphic evidence is to the effect that during the Cretaceous period nothern California was subsiding, and with it an undetermined area of southern and central Oregon, and that the sea was gradually advancing northward from what is now the Sacramento valley. This is shown by the successive overlapping of the later Cretaceous formations northward. The ancient Cretaceous river occupied an erosion basin sloping southward. At first it contributed to the enormous thicknesses of the early Cretaceous formations known as the Shasta and Horsetown series. Ultimately it disappeared itself and became covered by the inflowing debris from the north and west which now forms the covering Chico beds. It escaped dispersion and obliteration as it was sinking simply by reason of the rate of subsidence being more rapid than the rate of beach erosion. It is now far above the sea level as a result of a reversal of the regional movement from subsidence to elevation. The phenomena of a river bed disappearing beneath the sea without any dispersal or disturbance of its bottom gravels is not unique to this Cretaceous example. The Klamath river of northern California is at the present time furnishing an example of this. What is known as Gold Beach, on the coast of California a few miles south of the outlet of the Klamath river, is nothing but an old drift-filled bed of the Klamath. This old channel can be traced thirty miles back into the mountains to a junction with the present channel. It is filled with an unknown depth of drift, sands, gravels and clays, and the old channel bed at Gold Bluff is so far beneath the sea level that the channel rims exposed are several miles apart. The sea erosion, which is limited to the surface at the shore line, is slowly wearing away the upper portions of

the drift, but is not disturbing the lower portion. If it should be consolidated and reappear as the result of another reversal of the earth movement, the auriferous deposit would be similar to that of the Siskiyou auriferous conglomerate.

In the Chico sandstones are conformably bedded some seams or strata of conglomerate. Nothing conclusive is yet determined as to the auriferous character of these seams in Siskiyou county, but farther to the northward in southern Oregon, in the vicinity of Ashland, beds of this stratified Chico conglomerate appear which are sufficiently auriferous to pay for working. So far the developments made are limited, owing to difficulties of extraction of the gold by the usual methods, but there is no reason why, with better methods, they should not be largely utilized as a source of gold.

Another exceptional placer deposit exists near Redding, in Shasta county. It is a small channel deposit, containing fine gold. It is not sufficiently developed to estimate either its extent or economic value. Its peculiarity is that though of unquestionable Cretaceous age and buried beneath hard sandstone beds it is an unconsolidated formation.

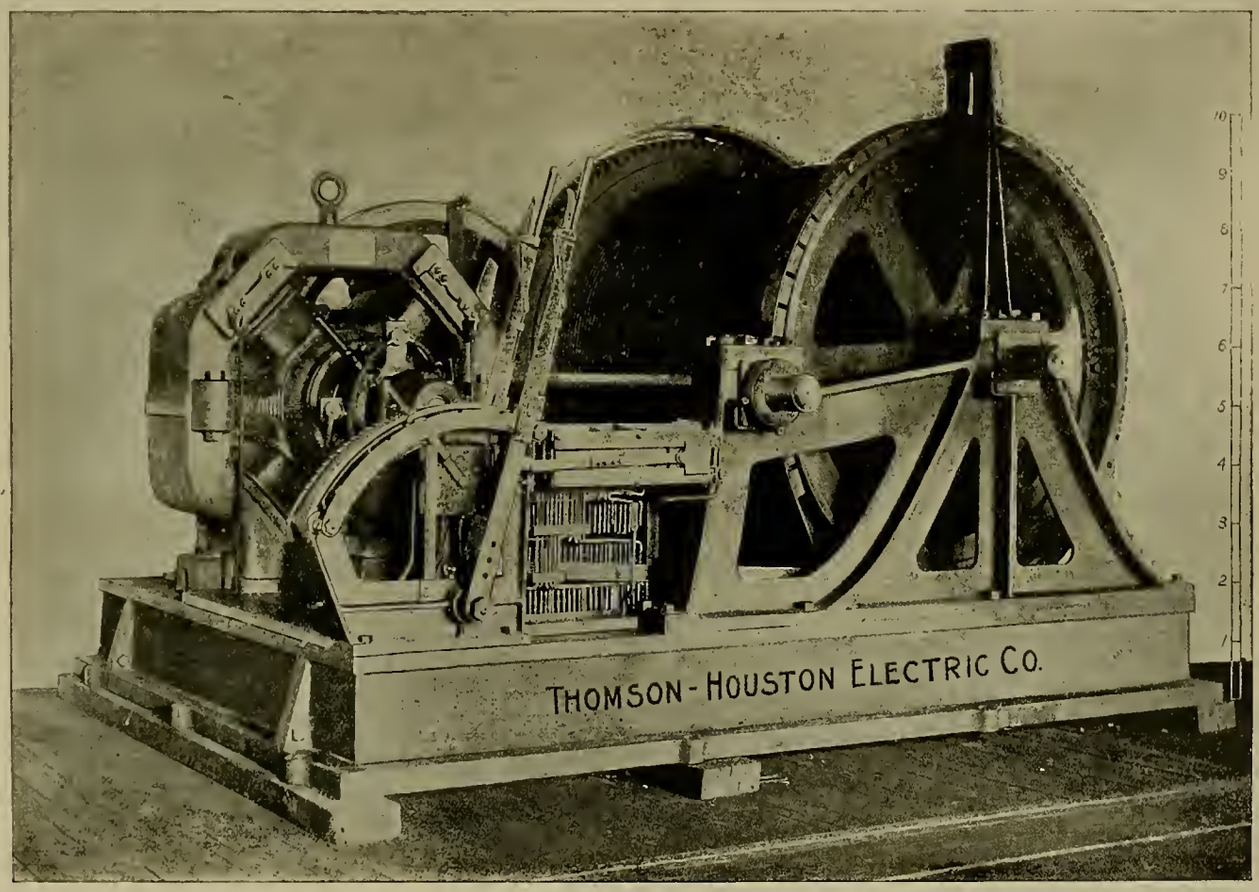
Since the identification of the Cretaceous auriferous conglomerate in Siskiyou county, the writer's attention has been called to two discoveries of auriferous conglomerates in the Mariposa slates formation of Jurassic age. It is in the Mariposa slates that the mother lode and other auriferous quartz lodes are found, and the occurrence of these auriferous conglomerates is conclusive in establishing the fact that there must have been a still earlier period of auriferous vein formation, the erosion of which furnished the auriferous deposits consolidated into these conglomerates. Both of these auriferous Mariposa conglomerates attracted the attention of miners to some extent. Shafts were sunk in them and a limited amount of mining done. Neither seems to contain sufficient gold to be of economic value. One of the identifications was of a conglomerate in Amador county, close to the mother lode. The other, with which I am personally familiar, is of a very extensive deposit fourteen miles northeast of Auburn, in Placer county. It is described by Mr. Lingren, of the U. S. Geological Survey, in the September number of the *American Journal of Science*. Both of these conglomerates, though of marine formation, were probably derived from the sub-aerial erosion of lode deposits. Their identification furnishes an explanation of the origin of auriferous slates independent of theories of gold deposition by chemical force. The gold in such slates being extremely fine, there is no improbability inherent in its being deposited with the fine sediments which ultimately become slates.

As a conclusion from the preceding, it may be safely affirmed, that there has not been a distinctive auriferous gravel forming period in the geological development of the California gold placers. On the contrary, there have been whenever there were auriferous lode deposits exposed to sub-aerial erosion—and that condition has been practically continuous from Pre-Mesozoic times—placer deposits formed. The backward range in time of the remains of these placers is specially instructive in reference to the times of lode formation. What has been in this article stated in this connection is intended to be rather suggestive than as expressing positive conclusions. A more detailed investigation of these varied placer deposits, not alone in California, but as well in other gold-bearing regions, will very likely lead to substantial economic results. Once the possibilities of distribution of gold in sedimentary formations becomes understood, an intelligent search can be made for it through a much greater range of rocks. This is specially so in relation to the conglomerates in auriferous localities. There is no geological reason why the auriferous conglomerates so extremely extensive and rich in the Transvaal in South Africa should be limited to that locality. The auriferous conglomerates of northern California and southern Oregon in superficial appearance are almost identical with the South African. A thorough exploration may prove them to be as rich and as extensive in range. I have not had the advantage of a personal examination, but am told there are similar conglomerates in British Columbia, but whether or not auriferous my informant could not say. There is, however, a strong probability that they are auriferous, sufficient to justify exploration and prospecting.

A clear understanding of the phenomena of placer gold occurence and distribution, as presented in the first portion of this paper, will likely prove of considerable assistance in determining the probable gold content of placers. Though it is not at all probable that any set of rules would prove conclusive in application to determining the gold content of every placer deposit, yet it is possible to so apply an exact knowledge of the formation of particular deposits as to have an added certainty to the correctness of conclusions relating to its mining.

Electrical Mining Hoists.

This style of hoist, of which an illustration is given on this page, is of strong and simple construction. The motor is of the regular stationary or M. P. type, mounted on the same bed plate as the hoist, and to which all bearings, levers, quadrants and other connections are attached, making the machine complete within itself and insuring great strength. The drum is provided with a powerful band or post brake, lined with wood and operated with a lever and quadrant. The motor is furnished with a reversing switch, so that in lowering, the load can be kept under control of the operator should it not be thought advisable to rely entirely on the brake. The speed of the hoist is regulated by a rheostat and controller of the latest pattern, actuated by a lever and quadrant conveniently placed. The steel pinion on the armature shaft, and the intermediate gear wheel which engages it, have machine-cut teeth, and all the gears are furnished with guards. The large pinion engaging the drum gear is bushed with hard brass and fitted with a clutch, so that the intermediate gears and motor armature need not run when quick handling and rapid lowering are desired.



ELECTRICAL MINING HOIST.

Improvements in the Cyanide Process.

The success which has of late been obtained in the recovery of gold from the tailings of stamp batteries represents a matter of the utmost importance to the immediate future of gold mining says the London *Mining Journal*. Nothing less than a revolution in the prospects of gold bearing deposits resulted from the practical application of the principle that cyanide of potassium can be used to dissolve gold, and that the precipitation can be effected by means of zinc shavings. For the past few years the burning question in gold mining has been how to work out this cyanide process so as to get the best possible results. It is only quite lately that details have become so far perfected through the experience gained in its actual working as to give results anything approaching those which were expected. In the first place, it has been found impossible to work the cyanide process successfully with inefficient crushing appliances. Upon the perfect pulverization of the ore depends very largely the degree of efficiency obtained in the working of the cyanide vats. To this fact are to be attributed in some measure the failures which have followed the adoption of cyanide in many gold mines in the United States and in Australia, and it is one strong influence in the marked movement now proceeding for enormously increasing the weight of stamping heads—up to 1050 lbs. each in the latest instances. Then the appliances, and even the methods of the cyanide works, require a careful attention to details and a special knowledge only acquired by long experience of the process. There is at the present time hardly a cyanide plant in the Witwatersrandt—the home of the cyanide process—which does not include much that is purely experimental. At the same time, there is a striking advance in the latest plants to those which have been only recently erected. The recovery of gold by the use of cyanide of potassium is, however, now extending largely in many other gold fields than that of the Randt; and amidst the rivalry of engineers and managers in different countries there should certainly develop many important and valuable improvements

in practice. Trials upon a more scientific basis are to take place again in America and Australia, and we are glad to hear that capital is being provided—though, unfortunately, from the United States—to treat the gold bearing ores of British Columbia with cyanide of potassium.

One of the principal economic difficulties of the cyanide process has been the transport of the tailings. So far as we can judge it will be fouud cheapest to utilize mechanical wire rope haulage. Then the expeditious discharge of the tailings is a most important matter, as upou the rapidity with which the plant can be worked must depend largely the amount of capital required in the first instance. Large improvements have been made in this direction lately, especially at the Langlaagte Royal, where the time of discharge has been reduced from five hours to three, or three-and-half, by means of patent doors. What is now wanted is a light dredging apparatus for facilitating the emptying of the fixed tanks, and there can be no doubt that the ingenuity of mining engineers will be fonnd equal to providing this. Tailings pumps, though they have been largely adopted do not seem to have met with any success over a protracted period of working. Undoubtedly, it would be a most valuable step in the progress of the cyanide method of ore treatment if efficient pumping appliances could be obtained to get rid of the tailings, instead of depending upon gravitation for their discharge. Apart from this important question, a good deal in the efficiency of the process depends upon the means used for distributing the tailings in the vats. There are many systems at work for doing this, rangiug from revolving arms of different lengths to ribbed disks with a spraying motion. Continual improvements are being made by practical men in these details which, of course, deal rather with the reduction of working expenses than with any especial increase in the efficiency of the process. But cheapness must be after all the primary quality of any process which is intended to deal with the residuum of low grade ores, and thus make their working a matter of profit. Shareholders in Transvaal gold mines will know how bitterly they have been disappointed in many cases with the results of newly erected cyanide plants, which were expected to make dividends practicable. They should, therefore, be gratified to receive our assurance that inventiou is active in this detail work upon which the ecouomic success of the process depeuds.

At present the efficieucy of the process is very much compromised by the fact that the amount of cyanide used is greatly in excess of the theoretical quantity necessary for the treatmeut of the ore, and as no means have yet been found for utiliizng the cyanide over again, this represents a considerable item of loss to the shareholders. Apart from this, it is seriously a question whether some steps will not have to be taken before long to prevent the escape of the liquid which has converted the vast heaps of residuum outside the mine into mountains of prussic acid. So far, no inconvenience seems to have been felt at this presence of poisonous deposits in the midst of a growing populatiou, but the danger is one that will have to be considered in the future development of the Witwatersrandt mines. It is almost certain, however, that the difficulty will be overcome very shortly either by an improvement of the cyanide process or by the invention of some new method of treatment. While the owners of the cyanide patent are able to reap such enormous profits from their discovery, it is not surprising that other inventors should seek a fortune in the same way. By the aid of electricity it has been songht to prevent the waste of cyanide by using it over and over again, and an attempt was made some time ago to replace the process by another in which the basis would be aluminum. So far but little has beeu done in this direction, though the advances made lately in experimental work would lead to the belief that the time is not far distant when the ore will be treated in a more economical manner thau is now possible. At present, the cost of treating tailings ou the Randt may be taken as an average for new and properly coustructed plants at 5s. a ton, and if the experimeuts uow being made should prove successful upon a large scale, this sum will shortly be reduced to 3s. 6d. per ton, thus leaving a balance of 1s. 6d. per ton as a clear profit to the shareholders. This refers only to working details, but there is besides the very important question of concentration of tailings to be considered. Experiments recently conducted at the Ferreira mine confirm the opinion which we expressed some time ago, in opposition to the rather discouraging attitude assumed by the Witwatersrandt Chamber of Miues, that it was perfectly possible to take out the rich ore in the coucentrates aud treat them separately. All these things should be most satisfactory to mining engineers, managers, and shareholders in all parts of the world; but, after all, they are by no means the most hopeful of the teudencies which are at present developing towards the more economical treatmeut of battery tailings and slimes. We have dwelt ou them, for the purpose of forshadowing benefits that many be shortly realized, but the advantages promised by the discovery of the actually new cyanide processes are more far-reaching. There are two or three such processes of which the theoretical success, at least, is said to be fully proved.

The Los Angeles Oil Developments.

The Los Angeles *Commercial Bulletin* has this to say of the new petroleum developments in that city:

About half a mile west from the center of the city, on the hills between First and Temple streets, there may be witnessed a sceue of rare activity. The profusion of derricks, boilers, steam engines and oil tanks cannot fail to convince the most skeptical that an exceptional development is in progress there. Evidences are within sight of the existence of not far short of 100 wells, and the field of operations is being rapidly extended. Conflicting views are entertained concerning the relative importance of the oil discoveries. Some conservative experts, more or less interested in neighboring oil fields, express the opinion that what has been tapped is a mere seepage, and not an oil deposit proper. They state that the net surplus yield of oil from this new source over and above the amount consumed in boring and pumping probably does not exceed 175 or 200 barrels daily, and that of a low grade; and that this product can be disposed of in the city for ordinary purposes without even affecting the previously established market price; and that its chief value consists in the contained asphalt. Others more sangnine, though not apparently concerned personally, say that, on the contrary, the daily output already exceeds 500 barrels; that the value of crude oil has in consequeuce declined to $1.40 per barrel from its previous level of $1.75; and that the new supply includes various constituents of special value, such as benzole, naphthalene and basic acid. They allege that coal is no longer fetched here except for domestic aud railroad use, and that new employments must be sought for the increasing oil product. The local yield, secured at a considerable elevation, it is apparent can be easily piped to convenient stations, even at considerable distances, and it seems not improbable that the railroads may be the next to turn it to account in the interest of economy. Southern California has now three main sources of supply of mineral oil—the Ventura county wells, situated uorthwest of and partly within Los Angeles county, the Puente wells eighteen miles southeast of this city, and the most recent source in the city of Los Angeles itself. Sau Francisco draws its supply by means of a tank steamer from Peru in South America. The daily consumption of Los Angeles City is said to approximate 700 barrels, and there are outside manufactories and establishments that consume large quantities, such as the Chino sugar factory, that takes five carloads, or about 660 barrels, daily. There appears, however, a good prospect that the latest oil discoveries, those in the city of Los Angeles, may lead to a considerable increase of manufacturing industry in this neighborhood, for it must be remembered that the present development has been accomplished for the most part within three or four months. Indulging, therefore, in no more than a reasonable amount of anticipation, we may say that after an extension of the business already carried on here, such as iron rolling, the manufacture of structural iron, of iron pipes, steam and gas engines, etc., it would seem to be an easy transition to the smelting of the various ores that abound throughout our tributary country; and it is expected that the increase in our fuel supply will hasten the extensiou northward of the Nevada Southern railroad, which will place at our disposal the finest iron deposits in the world, only 300 miles distant. From smelting naturally results the manufacture of various staple chemicals, such as arsenic, sulphuric acid, boracic acid and caustic soda, and from the oil itself can be extracted vaseline, neutral and lubricating oils, axle grease, inks, lamp black, electric carbous and aniline dyes, all of which can be shipped everywhere. Competent authorities allege that the supply of the various minerals from which the most essential and useful chemicals are manufactured is unbounded. It is to be expected that the command of such a variety of valuable resources will attract properly qualified specialists to their development here, and that in the language of one of the best informed local authorities, Mr. Sutherland Hutton, this city may become after a time, "the Pittsburg of the West." It is also well kuown that there are ample and conveniently situated deposits of potters' clay and kaolin, as well as of sand adapted for the manfacture of glass, the utilizatiou of which has hitherto only been prevented by the absence of a sufficient local consumption for the manufactured products, but which may now soon be set in motion, while it is hoped that the general increase of activity accompanying the oil discoveries may assist in advancing our claims for the construction of a local harbor capable of accommodating the largest sea-going craft. In this last respect they are particularly timely, seeing that a visit from the Senatorial Committee selected to advise upon this business is daily expected.

Such is the barest sketch of the attractive possibilities that the development of a local oil field appears to open up to this city aud surroundings. Its further progress will be followed with the liveliest interest; and while local residents will have general sympathy in their efforts to abate the smoke nuisance, it should be understood that any interference with the pursuit of such a promising industry in the public interest cannot be entertained for a moment. It may be well to remind our readers that whereas ten years ago the use of oil as fuel, beyond the production of the power employed in the operation of the Eastern wells, was unknown, and the suggestion of its general employment in that capacity was received with alarm and reprobation, to-day its daily use as fuel in the United States is 30,000 barrels; and that no little part of the hard work expended in bringing about the required transformatiou of public feeling on the subject, and in procuring the appropriate adaptation of furnaces, was put in right here in Los Angeles, and was instigated by the pressing necessity for some cheaper fuel than coal, either imported or hauled long distances from the interior, for any considerable developmeut of local industry.

The present total daily yield of petroleum in southern California is approximately figured at 1750 barrels, composed as follows:

	Barrels.
Union Oil Co.	500
Pacific Coast Oil Co.	250
Lacy Manufacturing Co.	200
Los Angeles City	500
Miscellaneous sources	300
Total	1750

Three aud three-quarter barrels are equal to one ton of the best coal, and the whole of this product, it is said, could be consumed on the one line of railroad between National City and Barstow; but the yield, we are told, conld be doubled within six months, aud besides the Union Oil Co. holds a stock of 92,000 barrels. The coal market has gone all to pieces. Large buyers, we learn, can now supply themselves at $5.50 per ton, a condition which is due to the geuerally depressed state of trade throughout the world.

Special advantages of the recently broached city supply are its moderate distauce from the surface—the average depths of the wells, we understand, being but 650 feet, though in some cases exceeding 1100 feet—and the soft and permeable character of the intervening strata. These peculiarities, along with the comparatively high valne of the location, no doubt account for the great number of the wells snuk within the present limited field, as well as for the scarcity of gas in the deposit, its lack of expansive force or gush, and the consequent necessity for bringing nearly the whole of it to the surface by pumping.

The Canadian Asbestos Industry.

J. T. Donald writes to the *Engineering and Mining Journal* as follows:

The following particulars of the present condition of the Canadian asbestos industry have been obtained by the writer in a recent visit to the mining district. There is at present no prospecting for asbestos, and with one exceptiou, to be noted hereafter, no business in buying and selling mining properties. After a somewhat prolonged period of dullness in the crude asbestos market, there are now decided indications of a legitimate improvemeut. Evidently stocks in the hands of manufacturers are running very low, and there is a moderate demaud from all parts of the world.

With the asbestos miner it is not now so much a question of finding buyers as of finding a margin on the prices offered. Sales have recently been made at the following prices f. o. b. at the mines: No. 3, a round lot at $40 per ton; No. 2, $65 to $67.50 per ton; No. 1, $115 to $140 per ton.

Nos. 2 and 3 are the grades mostly called for, and these are more largely produced by the mines. No. 1 quality is apparently not as much sought after as in the past, and as a consequence there is a notable stock of this grade in producers' hands. This is doubtless due to the very high price asked for the first quality during the speculative period of three years ago, which caused manufacturers to devise improvements in plant and methods, which enabled them to replace the costly fiber by lower grades. At the same time there is a limited demand for fiber of the very fiuest quality as to length and color and freedom from impurities; for example, a leading dealer recently was offering $150 per ton for thirty tons that would answer to certain specifications by no means beyond the choice product of our mines.

As a consequence of the improved inquiry for crude asbestos, the large and well-equipped mines, with two or three exceptions, are being worked, not to their full capacity, but yet to an extent that will make the output of 1894 a decided advauce on that of 1893. Fully 3300 tons have been exported during the first six months of this year.

The old Jeffrey mine near Danville, on the Quebec brauch of the Grand Trunk railway, has long been of geological interest from the fact that it occupies a knoll of asbestos-bearing serpeutiue, distant from forty to fifty miles from any other known deposit of asbestos. This mine, which has also possessed a local interest, inasmuch as it has been owned and actively operated by the oldest miner in the province, a veteran of some four score and seven years, has recently changed hands. It is now being vigorously worked by two of our most enterprising Canadians, who are at present employing 150 hands. These new owners have the great advantage of being in close touch with manufacturers of asbestos goods, and it

is probable that this well-known mine will become even more prominent than it has been in the past.

The old problem of separating the lower grades of fiber from the enclosing rock is still to the fore. A special feature in this connection has been the installation by Messrs. W. G. Costigan & Co., of Montreal, of their cyclone fiberizing machine in three of the most important mines; viz., the Jeffrey mine mentioned above, the Anglo-Canadian mine at Black Lake, and the Bell mine at Thetford. In this cyclone machinery the low-grade asbestos, which is rock and fiber in intimate association, is introduced in small lumps, which, meeting two rapidly revolving discs running in opposite directions, have their non-fibrous particles reduced to powder by attrition, while the liber, by reason of its nature, escapes injury, which is by no means the case when rolls or crushers are used. After leaving the cyclone the grit or gravel is separated by means of a series of screens, which, to a certain extent, also separate the fiber of different lengths.

Electrical Surface Haulage.

The cut on this page illustrates the largest and most powerful electric locomotive built up to date. It is shown hauling a train of loaded freight cars, weighing over 200 tons, up a three per cent grade and on a curve of 150 feet radius. This locomotive

ELECTRIC LOCOMOTIVE, BUILT BY THE THOMPSON-HOUSTON CO.

has been constructed by the Thompson-Houston works of Boston, for the Whitin Machine Company of Whitinsville, Mass., where it is used for hauling freight cars from the factory to the main line of the railroad. One motor, having a maximum capacity of 125-horse power, supplies the motive power. This motor is geared to the forward axle by a train of powerful cast steel gears. Parallel rods connect the two axles. The distance between the centers of axles is six feet four inches, and the diameter of the drive wheels is forty-two inches.

The motor is made with a waterproof finish throughout, specially designed for the purpose. The armature makes 1000 revolutions per minute when the car is running at a speed of five miles per hour. This speed is reduced by the gears in the proportion of from twenty-five revolutions at the armature shaft to one at the axle. All the gears are of steel and entirely enclosed in oil-tight iron cases filled with heavy oil to insure quiet running and thorough lubrication. The largest gear, that attached to the axle, has an eight-inch face.

Hydraulic Dam.

The Omega Mining Company are having the lumber necessary for the construction of a dam on Scotchman's creek delivered. The dam will be a dirt and brush dam, and is the most extensive operation of the kind that has been undertaken in this county. The work of actual construction will begin next Monday.

The dam will be built under the supervision of a representative of the Debris Commission, and when finished will permit the operation of the Omega hydraulic mine, which is a very rich property.—Nevada City Herald.

The Miners' State Convention and the Silver Question.

TO THE EDITOR:—It may be said that California has no especial interest in the silver question and that, being mainly a gold-producing State, we are working against our own interest in advocating silver; but this would be rather a contracted view to take. Anything that brings more money into general business channels, benefits every branch of industry; and silver is money or rather would be if the laws were so amended as to replace it on the footing it once had. The civilized nations of the earth are all satisfied with silver as money, while the Eastern and Indian nations prefer it. The only enemies of silver are the bankers; they have become so wealthy that they see no room in their vaults for so bulky a money as silver. They have forgotten the needs of the poor and of the value of silver to the general community.

It is unnecessary to enter into figures to prove this position, as it is an every-day matter and not pertinent to what we started in to speak of, which is, that our California gold miners should not overlook the benefit the resumption of silver mining would be to them, and in the way of bringing into circulation more money.

The California Miners' State Convention which takes place next month should give the silver question more consideration than has been given to it at any convention previously held, and, to that end, delegates from every section should be instructed by their organizations on the subject. For or against it, as may be, silver is one of the vital questions of the day. Why all the vast silver fields of the various States and Territories should be lying idle while the whole world is clamoring for more money, can only be accounted for by the fact that the monied powers of the world hold in slavery the people, and to break through this usurpation of power the people must act, and in acting define the monetary laws for universal good and self-protection.

History shows that the slavery of the Dark Ages was brought about in part by the decline in production of the precious metals, and in proportion as any country destroys its gain, in such proportion is the downward trend of comforts and civilization.

We have only to review the prosperous past to comprehend what would be the future as compared with the present, if silver mining could be re-established, which laws of our own making could do. It behooves the gold miners of California to stand by the silver miners of the silver-mining States and Territories. ALMARIN B. PAUL.

San Francisco, Oct. 18, 1894.

Alaska Beach Sands.

The *Alaska News* of October 4th says: Tom Ashby and Geo. M. Mason arrived here from their ruby sand beach diggings, near Cape Fairweather, on the schooner Nellie Martin, last Saturday. The men employed by them, namely, J. Pennypacker, Jas. White and Cornelius Edwards, also returned. Tom Ashby states that they had built three houses—one 18x18 feet, and the other two 12x14 feet. They cut and surveyed the flume line of 2500 feet, so that next spring they would be able to start building the flume and three lines of sluice boxes, to wash the gold-bearing sand. In trying to float two rafts of 8000 feet of lumber across the creek to their diggings, the rapid water floated half their lumber into the surf, which was broken up and lost. This loss prevented them from building the flume this season. The beach averages 400 feet wide, the pay sand extending into the woods and runs up and down the beach for two miles. In some places prospect holes showed the ruby sand in layers five feet deep. They will return next spring and work the entire season. Their flume will be eight inches deep and twelve inches across, and will tap a large stream of water about 2500 feet from the beach.

Tule Canyon Gold.

The *Silver State* says: Near Death valley, in Tule canyon, Nevada, some rich gold mines should be opened. In this canyon, rich dry diggings were discovered some fifteen years ago. In 1880 a few men were at work there. They had no machines for dry washing, and did not even winnow the dirt by tossing it up in the air, Mexican fashion. They simply dug over the ground with picks, collecting such pieces of gold as they happened to see. In this way they made good wages in ground from two to four feet deep. Working in this rude way they found one nugget that weighed five pounds, and very many worth from $5 to $75. Pieces of gold worth about fifty cents were the smallest saved working in this way—"by eye." With water or even dry washing machines, such ground should have paid immensely. As all the placers in the great basin region are of local origin, Tule canyon must cut one or more large and rich veins of gold-bearing quartz.

Reduction Works in Sacramento.

A few months previous to the strike a project was under way for the establishment in Sacramento of reduction works for the oxidation of rebellious ores and the utilization of the other constituents besides gold. The project has been revived again and promises to become a certainty, as half the necessary amount is pledged, says the Sacramento *Record-Union*. The plan is to put up machinery capable of handling ten tons per day, and buy outright the concentrates from Nevada and other mines, instead of reducing them on a commission. It is calculated the concentrates or sulphuret ores can be roasted at a cost of $3 per ton and the gold extracted. Those from certain mines are rich in iron sulphurets, which will leave a residue which, when ground to powder, makes a high-class fireproof paint, and when treated by washing also produces large quantities of sulphuric acid. Ten tons of these ores, it is calculated, will turn out, in addition to what gold they may contain, seven tons of mineral paint and ten tons of sulphuric acid. The promoters figure, therefore, on an absolute certainty of large returns for their outlay, and a speedy enlargement of their plant. If their expectations are realized the industry will prove a great addition to the city's prosperity.

Scientific Progress.

The Greatest of Modern Problems.

Mr. Newton Harrison, E. E., in writing for the *Electrical Age*, states that the problem of mankind—the economical production of energy—has been attacked on all sides by some of our most eminent scientists. It is openly confessed that some other method than the mere combustion of a fuel is necessary in order to obtain a greater percentage of its stored energy.

Osmose—hitherto a superficially treated subject—is a rich field for the investigator. The pressure set up by a body when dissolving in a liquid, or a solution when mixing with water, may assume an enormous value. Common sea water acts with a pressure of 300 pounds per square inch in its tendency to mix with pure water. It is the substance in solution that causes this pressure and is true for all dissolved substances.

The resolution of the theory of the primary cell to such a basis places us on a more substantial footing than ever before. Dr. Ostwald shows the parallel relationship existiug between osmotic and electrical pressure. In other words, to obtain great E. M. F. from a cell, we must select two materials as elements with the greatest difference of osmotic pressures.

As Dr. Ostwald states, "The zinc and copper of the Daniell cell are two such sources of current of different potential and the difference of their electrical pressure is based on the difference of osmotic pressure with which the zinc ions and copper ions are respectively endowed." A factor that will affect these conditions is the electrolyte. An electrolyte must be chosen whose reactive effect when charged with zinc ious will be least, while for the other electrode it will be greatest. By this means we are best prepared to make the most efficient combination with the elements at our command.

In this introduction to the subject of cousumption, the inefficiency of a steam plant, the loss of ninety per cent of the energy of the fuel is due to the difference in temperature between the fire and boiler.

Upon presenting this fact to our recollection, Dr. Ostwald points out a method for obtaining the chemical energy of the coal without heat. He shows that the application of an acid to the zinc in a zinc and platinum cell is not productive of the greatest E. M. F. The greatest electrical effect is produced by the acid being applied to the passive electrode.

From this principle he contemplates the possibility of oxidizing coal, not by the oxygen in direct coutact with the coal, but by the interposition of an unconsumable electrolyte. By this unexpected means the entire chemical energy of coal may be utilized, and in a manner so subtile and refined that no visible sign will appear of such an intense action.

The searchers after gold—the plodders of an early age—have been succeeded by more apt investigators—animated by a loftier purpose; they seek uot to make gold, but to save it.

The Secondary Products of Combustion.

A statemeut has been communicated by M. Iloswa to the Bulletin de la Societe Chemique de Paris respecting certain determinatious made by him of the formation of secondary products coutaining nitrogen by combustion in air. The author considers he has proved that, on burning in air one and the same volume of coal gas and of hydrogeu, one and the same weight of nitrogen is converted into ammonia. On burning equal volumes of coal gas and of hydrogen, the nitrogen transformed into nitrous acid will also have approximately the same weight. But on burning carbon monoxide, nearly two and one-half times more nitrogen is found in the state of nitrous acid than in the former case. Supposing one kilogramme of each of these gases to be burnt, the most nitrogen in the state of ammonia, and in the state of nitrous and nitric acids, is found in the product of the combustion of hydrogen, only one-fourth of the quantity being found in the case of coal gas, and about one-twentieth in the case of burning carbon monoxide.

On burning wood charcoal in air, whether merely dried or heated to redness, the quantity of nitrogen contained in the nitrous and nitric acid collected is almost equal to that of the product. There is not much difference in the result of burning an equal weight of coke. The formation of ammonia during the combustion of coke or charcoal is merely a result of the decomposition of these substances. Otherwise it would be difficult to understand why the weight of the ammonia formed should vary according to the degree of heat. On burning coal gas and hydrogen, the sum of the equivalents of the acids named is from eleven to fifteen times greater than the figures of the equivalents of the ammonia. M. Iloswa remarks that hydrogen peroxide is one of the constant components of the atmosphere, and almost always accomplishes the reactions commonly attributed to ozone. He gives up as impossible the determination of atmospheric ozone upon a scieutific basis.

Weight and Horse Power of Rain.

One inch of rain falling upon an area of one square mile is equivalent to 2,323,200 cubic feet, or nearly 17,500,000 gallons, and this quantity of water will weigh 145,200,000 pounds, or 72,600 short tons. If one inch of raiu fell over the entire area of Philadelphia, 129 square miles, the quantity of water which would be precipitated would be represented by 2,250,000,000 gallons, or 18,730,000,000 pounds, or 9,365,000 short tons. Therefore the quantity of water represented by one inch of rainfall distributed over twenty-four hours falling upon the area of Philadelphia would be nearly ten times the maximum pumping capacity of all our waterworks engines for a day, aud is more than twice the total capacity of all the reservoirs now connected with the city water supply. Professor Loomis gives the average height of clouds at about two miles, and as the aqueous vapor always present in the atmosphere is suspended for a considerable time and carried for great distauces by winds, it is highly probable that the great majority of the water which falls as rain has been elevated by the sun to a height approximating 10,000 feet. While it would be fair to assume this figure in calculations, there may be objection to it on the ground that the clouds from which much of our rain is precipitated are not more than a half mile above the earth, and, therefore, a height of but 3000 feet will be estimated for, but those who desire to assume the greater elevation can readily calculate what the figures would be for 10,000 feet. As above shown, the weight of oue inch of rain upon one square mile is 145,200,000 pounds; multiplying this by 3000 feet for the height, and dividing by 60 on the assumption that this inch of rain fell in one hour, we have as a result 7,260,000,000 foot pounds representing the amount of work done by the sun per minute if the water was raised as rapidly as it fell. This is equivalent to 220,000-horse power. If pumping machinery worked at the low economy of two pounds of coal per horse power per hour, or if the pumps gave a duty of 100,000,000 foot pounds, 200 gross tons of coal would be required to raise to a height of 3000 feet the water represented by one inch of rain on a square mile; now multiplying this by 129 to represent the area of Philadelphia, we have 28,380,000-horse power and a coal consumption of 25,800 long tons.—Mr. John Birkinbine, before the Engineers' Club of Philadelphia.

Mechanical Progress.

The Making of Tool Steel in Sweden.

In a paper dealing with the manufacture of open-hearth steel in Sweden, read before the American Institute of Mining Engineers, Mr. Erick Odelstyerna gave the following information regarding the making of tool steel: For the manufacture of hard, first-class tool steel, pig iron as low as possible in phosphorus is, of course, required, and is made from the most non-phosphoric ores obtainable, with the use in the blast furnace of charcoal nearly free from phosphorus. Tests made by Prof. R. Akerman have shown that the charcoals delivered from the sawmills in Norrland, and made of wood from which the bark had been taken off before it was floated down the rivers, are those most free from phosphorus. If such charcoals cannot be had cheaply enough, local pine charcoals are used, the more phosphoric charcoals made from other kinds of wood being avoided.

In hard steel it is preferred to keep the phosphorus under 0.03 per cent, and no steel is called first-class which has 0.035 per cent or more. The best sorts contain 0.022 per cent and less. The sulphur in the pig iron has not quite as much influence on the steel as it has on the soft steel, because the effect of manganese on the toughness is not as noticeable with the higher percentage of carbon, and therefore more manganese can be added; but the pig iron and steel are not allowed to contain more than 0.02 per cent of sulphur, if, indeed, even this does not require too great a percentage of manganese. This is not a very difficult condition, for with the careful roasting of the ores always performed at the blast furnaces, and with sulphur-free fluxes, it very seldom happens that the percentage of sulphur in the pig iron is higher than the figure given above.

The steel-melting is so conducted that a good steady heat is kept in the furnace during the process, in order to get the steel, if possible, entirely free from gas at the time of tapping without too high a percentage of silicon—that is to say, so that the ingots may be solid and free from blow-holes, without too much tendency to pipe.

If the steel is coming from the furnace too hot, so that piping is to be feared, it is either kept long enough in the ladle to sink to the proper temperature, or the so-called "De Laval" heat rings are used. These are iron rings lined with fireproof material heated to a very high temperature, which are placed on top of the molds; and, in casting, are filled with steel, which remains melted in them, and sinks until the ingot below the ring is entirely solidified.

Probably the danger most difficult to avoid in the making of hard steel is getting it too hot, which renders it liable to surface blow-holes. It has been found, however, that such blow-holes are formed only when the melter, at some time during the process, has let the furnace become so cold that the molten mass has taken up too much gas, and afterwards has attempted to repair this fault by forcing the temperature at the end of the heat. Under proper discipline, the tapping of such steel has, therefore, become more and more rare.

In the manufacture of steel for castings many difficulties had, at the outset, to be overcome, because the furnaces used in Sweden were not suited to the business. They were made very shallow, in order to permit the pig-and-ore process to be operated with rapidity—that is, the furnace was very long and wide in proportion to the size of the charge. This caused, in the making of steel for castings, too quick heats, with too much liability of the metal to take up a large amount of gases, and also, after the addition of ferro-silicon, too much oxidation of the silicon before it has had time to be dissolved in the bath.

At the steel-casting works—all of which make soft steel also—it is necessary to select a middle course, and to increase the depth of the hearth (thus extending the duration of the heat), although it is not increased sufficiently to get the ideal of a furnace for steel castings, because the hearth would then be entirely unfit for the production of soft steel. It follows also that to make steel castings of perfect quality, it is necessary to maintain a very high temperature in the furnace during the melting—that is to say, so high that the metal never becomes free from silicon, whereby the absorption of gas is resisted. For this reason the furnaces are much more severely strained in this manufacture than in making steel to be rolled, and they do not last half as long.

Another result is that the steel has always to be tapped a little too hot, although protection against overheating is provided in the charging of the relatively cold ferro-silicon, near the end of the operation. This excessive heat, however, is of use in the manufacturing of small castings, and for large ones the steel can always be let stand and cool in the ladle. In casting small pieces it is kept hot enough to be tapped from the big ladle into crucibles or hand-ladles, and from these into the molds, whereby a finer surface is obtained, because the metal is not poured in such a heavy stream as to detach loose particles from the surface of the mold.

A Miniature Locomotive.

The London *Industries and Iron* reports that a short time ago Messrs. Bagnall and Co., Limited, of Stafford, built a locomotive which is unique in its way. The utility of employing steam locomotives on estates to carry about half a dozen persons was demonstrated by trial trips on a temporary line of eighteen inches gauge. The locomotive in question was built for use in a gentlemau's park, and runs on light rails ten and twelve pounds per yard, fixed to sleepers with automatic fish-plate joints. The engine has single driving wheels with leading bogie wheels and tender, and measures about three feet four inches to the top of the boiler. It is employed with a neatly finished open carriage capable of accommodating six persons. This has three cross seats, each for two persons, and is protected by a canvas awning. At the rear a miniature brake-van is coupled. Such a train can be run at from twelve to fifteen miles per hour, but on long tracks a speed of twenty-five miles can be obtained. Such a railway can be laid with great facility, and on fairly even ground a portable line, one mile in length, could be laid by four men without much exertion. A temporary road of this kind is of use for industrial purposes with tip wagons.

The engine is a perfect miniature of a passenger locomotive complete in all its details. It is capable of hauling a load of about five tons on a gradient of one in ninety, and, as a high speed can be obtained with safety, such an engine may be found useful for light passenger work on narrow-gauge lines or for purposes of inspection. It has cylinders four inches diameter by six and one-half inches stroke, the driving wheel being thirty inches diameter, and is suitable for lines of portable railway laid with rails weighing ten pounds per yard to an eighteen-inch gauge. The engine weighs about two and one-half tons in working order.

It has been said of the prototypes of this locomotive that "their majestic proportions have always excited the admiration of engineers. It would be difficult to name many types which have lived so long, and which comply so fully with the heavy demands of an exceptionally fast traffic." As our readers may care to possess the leading particulars of a class of locomotives which have earned such high praise, we give the same herewith: G. N. R. express passeuger engines—Cylinders, 18 inches diameter by 26 inches stroke; driving wheels, 8 feet diameter; steam pressure, 140 pounds; tractive effort, 94.5 pounds per pound of cylinder pressure; boiler, 4 feet diameter, with 174 tubes, each 1¾ inches diameter; heating surface, 109 square feet in firebox, 936 square feet in tubes, making a total of 1045 square feet. The gate area is 17¾ square feet; the bogies have wheels 3 feet 11 inches diameter, and the trailing wheels are 4 feet 7½ inches in diameter. The load on the bogie wheels is 8 to 12 cwt., on the trailers 10 to 12 cwt., the total weight being 45 tons 3 cwt. The tender is carried on six wheels 4 feet 1½ inches diameter, and holds 2000 gallons of water, or sufficient for a run of 105 miles without a stop, such as the run from King's Cross to Grantham. Five tons of coal are also carried. The total wheel-base is 29 feet 6 inches.

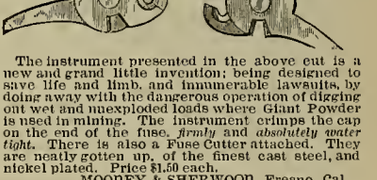
GIANT POWDER FURE CAP FASTENER.


The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.
MOONEY & SHERWOOD Fresno, Cal.

Practical Hydraulics.
A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators.
BY P. M. RANDALL.
This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.
TABLE OF CONTENTS.
The following brief abstract of the contents will give an idea of the branches of the subject treated: General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water Through Openings; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels, Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.
Price, $2.00, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GOVER.—*Republican:* Very little is known concerning the status of the litigatiou between the Gover mine and its creditors. The old electric pump is being repaired and a new pumping apparatus is being put in. The insolvency proceedings in San Francisco have been further continued for sixty days. The creditors do not seem to know whether the present operation in fixing the pump, etc., are being doue by virtue of the agreement entered into between the Gover Compauy and its creditors, according to which a stay of proceedings was guaranteed by the creditors for three years. The creditors consider that that agreement is null and void, inasmnch as its conditions have not heen complied with hy the company.

MISCELLANEOUS.—D. Cutmann and others connected with the Alma were in Jackson during the past week and completed the purchase of three acres of land, being the western portiou of W. P. Peek's town lot. The land is believed to be in the direct line of the main belt, and has been purchased for mining purposes. They bonded the tract several weeks ago for $1000, and this week they plauked dowu the full purchase money and received a deed. The same company has also bonded three or four acres of the Jones ranch, beiug the coutinuation of the line of the mineral lode to the north. With the Alma this gives the company the control of abont half a mile of the maiu belt. They are pushing work ou the Alma, putting up good machinery, and everything indicates that they are going in for a thorough prospecting of their claim.

The Truckee Lumber Compauy, who owu the Vaughn claim, in Hunt's gulch adjoining the Kelly mine on the east, have let a coutract to sink 100 feet on that property.

THE BAY STATE OF PLYMOUTH.—Amador *Ledger*: At the Bay State the shaft is down 615 feet, and 650 is the place where they expect to discontinue sinking and go to taking out ore and crusbiug it in the mill which will be in readiness to work within thirty days.

THE EXTENSION OF PLYMOUTH.—The Extension Miniug company has its shaft down 48 feet and is still at work with good prospects. Mr. Chisholm, who is in charge of the company's work, went below Monday to consult with the men who are putting up the money for the work. He is employing five men.

THE PIONEER OF PLYMOUTH.—Dr. Boyson has about thirty men at work in the Pioneer mine; he is now crosscutting to the ledge matter from the 400-foot level. During the past few days he has encountered strata of high grade rocks which serves to indicate that he is rnnning to a fine body of ore. His mill which has 20 stamps is in condition to run. He has water to run it wbich has a 586-foot pressure. He has a large quantity of ore on hand and will start up the mill in a short time.

THE MEDIAN OF AMADOR.—The Median rock is being crushed at the South Spring Hill mill, ten stamps being in constant use. The old blanket plant of the South Spring Hill has been repaired and is being used to catch the slimes from the Median crushings. The rock is coming from the 200 level.

THE LUCILE OF PLYMOUTH.—The Lucile, formerly the New London, has forty meu at work. The shaft is now cleared and retimbered iu the neighborhood of one huudred feet. In a short time they expect to reach the water level and hope to find the shaft opeu and in good coudition to the bottom of the old works. A number of meu are at work retimhering the oid forty stamp mill and puting a new roof on it. The uew hoist will he completed in a few weeks and then if the old works are in good condition, as soou as the water is out and the ledge opeued up, work at the mill will he commeuced. Supplies are on hand for a continuous run throughout the winter. They will put in an electric plant for lighting purposes.

PIONEER DISTRICT.—S. D. Wicks is having a quantity of ore crushed at Gracey's mill.

Mr. Kimhall of the Dead Sbeep mine in Pioneer district has just had a crushing of rock through the Gracey mill which turned out very fine indeed.

W. Q. Mason, whose mine is in Pioneer Creek, has a three foot ledge in his tunnel and the ore is very good. The generally encountered ledge in this formation which is granite is but a few inches, seldom exceeding twenty-four inches. The strike of a three foot ledge of good ore is almost phenomenal.

THE VAUGHN & KRUGER JACKSON.—Mr. Champion, a Westeru mining man, who with several partners years ago filed upon the above named property, near Middle Bar, was in the towu a few weeks ago and let a contract to sink upon the property 100 feet. He says he intends to follow this up until he thoroughly prospects the property. Mr. Champion is now the sole owner of the property having succeeded to his deceased partner's interest by purchase.

THE SANDY BAR OF JACKSON.—H. F. Vogt has just returned from San Francisco. He is now in charge of the Sandy Bar Mining & Milling Compauy as superintendeut for the owners.

THE BRIGHT OF JACKSON.—This property which was bonded to the Reichling Bros. a short time ago aud by them placed in the hands of a company to prospect and develop, awaits the cancellation of a former hond to N. A. Bradley and others which was practically given up, hut which requires action to that effect by the company which is almost in a state of collapse. It required some time to reconstruct the company so official action could be had, but it will be affected next week.

Butte.

WORK COMMENCED.—Forbestown *New Era*: Work has been commenced at the Denver mine. The tunnel which was started a short time before the mine closed down will be run to the ledge. Air compressor and Burleigh drills will be used and the work pushed as fast as possible. This tunnel will tap the ledge at a depth of nearly 900 feet, and about 400 feet below all previous workings.

RICH PROSPECTS.—Oroville *Mercury:* George Fiuch was down from Forbestown yesterday and in conversatiou with a *Mercury* reporter told of the rich quartz prospects that he is developing. He is interested in two extensive ledges on the north side of the South Fork or Feather river, opposite Forbestown. He had with him a uumher of beautiful samples of ore, showing rich in free gold and bigh grade sulphurets. The ledges are of recent discovery and of great extent, and development work is being pushed on both of them. In one of them E. Ellsworth is associated with Mr. Finch in the ownership. It is on the average six feet wide and assays show the ore to go $10 free gold, $180 in silver and the sulphurets $300 per ton.

The other ledge is owned by Mr. Finch, Sam Titus and L. C. Jacobs and averages thirteen feet in width. The ore assays $29 in free gold and the sulphurets $300 per ton.

The ledges cau be traced for miles and Mr. Finch and his partners have every reason to bolieve that they have a bonanza.

Calaveras.

BISBEE.—*Mountain Echo:* The Bisbee mine situated near this town is making an excellent showing. The shaft is sixty-five feet deep. The ledge is twenty-five feet wide, and the ore carries free gold and a large per cent of rich sulphurets.

PROSPECT.—Geo. C. Turner is gettiug some good prospects in bis mine near Smith's Flat. Mr. Turner has a good mine, and the time is not far off when it will he sought after hy men of capital who will develop it.

It is reported in Angels Camp tbat a rich lode of gold-bearing quartz has been discovered at Murphy, and that the vein is twenty-five feet wide and the ore pays $7 per ton. It is to be hoped that the report is true.

GOOD ORE.—Calaveras *Chronicle:* The Seeman Bros. mine, which is situated near Railroad Flat, is turning out some good ore. The shaft is uow down to a depth of forty-five feet. There are five parallol ledges, running east and west, the main ledge being about two and a balf feet wide and prospects at an average rate of $12 per ton. The Seeman Bros. have a cabinet of specimen rock, that they have takeu from the mine, valued at $1000.

El Dorado.

CHURCH MINE.—*Mountain Democrat:* Operations at the Church miue have been suspended for a week or so, owing to the twisting off of the piuion shaft. Besides the loss which will follow the temporary closing down of the mill, the repairs will cost the company $1000.

Lassen.

HAYDEN HILL.—Cedarville *Record:* Hayden Hill, lying about 15 miles south of Adin, in Lassen county, is destined, we thiuk, to be one of the liveliest and most prosperous mining camps in Northeru California. The claims being worked there now are the Golden Eagle, Evening Star, Blue Bell, Brush Hill, Providence, Juniper, and Dale's claim, all of which are yieldiug a fair quantity of good paying ore, the rock assaying from $10 to $40 per ton of free milliug ore. More real prospecting has been doue there during the past year than ever before, and the prospects are better.

At the southern point of the Hill the Big Valley Tuuneling Co. have run a tunnel into the hill to a distauce of 1,000 feet, and are driving it right along with the intention of tapping the main ledge at a depth of 1,500 feet below the surface. Several veins of good quartz have already been cut through, hut work is heing pushed on to reach the center of the mountain, where it is expected the "mother" lode will be tapped. The projectors of this enterprise certainly deserve much credit in pushing the work ahead, and from indications now reported, they will soon be taking out the yellow ore.

Mono.

A BRIGHT OUTLOOK.—Bodie *Miner:* Without exaggerating in the least, it can he said that Bodie's outlook is brighter than for years past, and the old camp will continne to produ e hullion in large quantities for years to come. The successful operation of the Standard Company's electric plant, hy which the cost of milling has been considerably reduced, has been and will continue to he an item of great importance in the town's prosperity. By the introduction of electric power in mining and milling, it will he possible to work ores at a profit which heretofore would not pay. It is well-known that there are thousands of tons of low-grade ore here that will eventually he made to yield a profit, and is it visionary to look forward to a time when a big electric plant will be put up to provide power for working mines which have long heen idle and for some now heing operated on a small scale? Not at all; and, in fact, those best informed confidently predict that within the next year something in this direction will he done. The Standard is now putting in a dam across Green creek to seenre water enough to develop power sufficient to run the mine as well as the mill, and when this is done a still further reduction in the cost of miniug and milling will he accomplished.

Nevada.

AN IMPOUNDING DAM.—Nevada City *Transcript:* The work of building a dam for the Omega Mining Company at Omega has been commenced on Scotchman creek. It is to be built of timbers, brush and dirt, and will he the largest of the kind ever constructed in the couuty. A representative of the Debris Commission will superintend the work. When the dam is built the company will be permitted to resume operations in their hydraulic mine.

CENTENNIAL.—Nevada City *Herald:* Work on the contract recently let for running a crosscut in the Centennial mine is being pushed vigorously. Two shifts are being worked. The object of the crosscut is to intercept the rich gravel developed about the 1,500 station of the main tunuel, so as to work it to better advantage. The Centennial people are persevering, and everybody hopes they will be richly repaid for their big outlay in developing this mine.

THE REWARD.—Nevada City *Herald:* A tunnel to drain this mine to a depth of 500 feet is being run, and will soon be completed. The company have a good ledge, and they are quite satisfied as to its paying qualities when it is properly opened. It is owned by old operators in this district, who deserve success. Men who stand by a mining district through thick and thin deserve the highest consideration from those who are depending upon the success of the district for a livelihood. The vicissitudes of mining are many, and it is not always those, who, from the expenditure of money, energy and intelligence, deserve most, that receive the highest rewards. Sometimes the lucky man is the novice, and yet, in general, those who persevere succeed.

THE MERRIMAC.—Nevada City *Transcript:* Active work was recently commenced at the Merrimac mine out near Kitts' ranch, on the line of the Narrow Gauge Railroad. This mine was worked a number of years ago, and some very fine quartz was found there, but for some reason operations were suspended. A company with abundaut capital has now got hold of the property and intends to thoroughly open it. L. P. Goldstone is the superintendent, and he has instructions to have all work performed as expeditiously as possible. A station is being cut at the depth of 500 feet, and the running of drifts will be commenced as soon as possible. After the mine gets in operation, and rock is being taken out, the company intend putting up a mill. It is the opinion of mining men that the Merrimac will prove a valuable property and that its development will be the means of inducing capitalists to come in and take hold of other mines in that vicinity which are now lying idle and which it is believed need only to be worked systematically in order to put them on a paying basis.

NEW HOISTING WORKS.—Nevada City *Herald:* The new hoisting works on the Contact miue is now in course of construction, and will he quite a commodious structure. Some splendid timbers were hauled out this week by M. L. and D. Marsh to mount the machinery on.

Placer.

A PROMISING MINE.—Colfax *Sentinel:* A new Cuttenberg mill has lately been erected at the New Golden Rule quartz mine at lower Horseshoe bar, six miles south of Newcastle. A 300 foot drift has been run, the greater portion of it on the ledge. Twelve men are employed and the rock is beiug milled with good results. This ledge is on the opposite side of the American river from the famous Zantgraf mine, and is no doubt an extension of that ledge.

AT WORK.—Colfax *Sentinel:* Superintendent W. H. Grenell, of Bath, informs us that things are prosperous at the Breece & Wheeler mine at that place. About thirty meu are employed.

Hon. C. F. Reed has resumed work at his Gold Blossom mine at Ophir. A boarding house has been built and he will soon erect a mill.

OPHIR.—Placer *Herald:* The Boulder seems to keep her end up so far. Mr. Haudy is working a very small force of men at present, but seems he makes it pay.

The Hathaway mine is working at full blast. Quite a large force of men are at work and every thing looks as though this mine would not shut down for a while yet.

CENTENNIAL.—The Centennial mine at Butcher Ranch belonging to George Chesehro, was hid in at sheriff's sale last Monday by the Rico State Bank.

San Diego.

RICH ROCK.—Los Angeles *Times:* Developments in the mine of W. A. Hayt and A. S. White in San Diego county, near Warner's ranch, show a fine body of rich ore, varying from $40 to $300 per ton. There is talk of putting a mill there.

Shasta.

NOTES.—Redding *Free Press:* The Lost Confidence mine, at Iron Mountain, got up steam Tuesday morning, and will keep up a steady grind until February, crushing between seventy-five and eighty tons per day.

At the Hidden Treasure a few repairs are heing made on the buildings, preparing for winter rain and snow.

The Minnesota people on Spring creek are making a 700-foot upraise from the face of the tunnel to the surface.

Bullard & Vandeveer are putting their arrastra in shape for a good winter's work.

Work is heing done on the Red Rock mine, near Copley. They have two feet of rich copper ore carrying gold.

Col. Jack Stowell is waiting for silver to raise before doing any further work on his mine.

Pat Rohn's Indiana mine, near Copley, is heing experted, pending a sale. It shows a well defined four-foot ledge of $15 fine milling ore.

At the Balla Klalala the new ditch is nearly completed; all the tunnels on the mine are cleaned out and ready to stope ore.

At Wbiskytown the property heing worked hy Hunt & Jones has developed some rich ore. The water was too mucb for the whim and a twenty-horse power hoisting engine will be put on the mine next week.

The Riley mine, on Squaw creek, is being opened up ready for inspection; considerable timhering is necessary. A deal is pending, so it is understood.

Most of the seam miners in the Whiskytown district report good success during the past summer.

All kinds of rumors are afloat about the Gladstone at French Gulch starting up, but nothing definite can be learned.

Mr. Graham, the millwright, has charge of the erection of the mill on Jack Conant's American mine on Kline gulch, and it will be running in about six weeks.

At Old Diggings the Texas Consolidated new bonanza is all the talk. Miners agree that it is the finest body of ore in the county. They have drifted on it three weeks and the pay still continues.

The Central mine, under the superintendency of A. A. Anthony, put a force of men at work again this week.

The Kosciusco, at Quartz Hill, shipped a bar of bullion to Chicago last week valued at $5000. The late rains broke the ditch, causing the mill to lie idle one day.

Sierra.

POCKETS.—*Mountain Messenger:* Jerome York and the Wilson boys found another pocket last Sunday. They took about $200 out in a few hours. It is gettiug to be a common thing now to have the boys bring in $200 or $300 for a day's work. They have found a good many pockets this summer, but there are still many more in the country awaiting the pick of the prospector.

Wilson Hovey of St. Louis called on us last Thursday and reported the Grass Flat and Riffle mines doing finely. Six men are working two shifts at the Excelsior. Hendel and Packer are working thirty men on Slate creek. J. Moyle has paid off all his indebtedness to the men and other parties, and work has been temporarily discontinued.

BUTTES SADDLE.—*Mt. Messenger:* The machinery for the tramway of the Buttes Saddle Co. arrived this week and will be immediately put in place. An upraise is heing made from No. 1 to 2 tunnel for air. The mill will be started about the middle of October.

BORING.—Mr. Robley and a crew of men are still engaged in sinking a prospect hole with a boring machine on the St. Charles Hill Mining Company's ground. Last Tuesday they were drilling through a hard lava boulder. At that time they were down 122 feet and three-quarters of an iuch. The water bothers them considerably but so far they bave been able to handle it. They expect to have to sink twenty-five or thirty feet before they reach bedrock.

BULL OF THE WOODS.—Plumas *National-Bulletin:* Early in the summer we mentioned the fact that Major Michael Mason had a very rich quartz development known as the "Bull of the Woods," situated near Haskel's Peak, in Sierra county, and about three and a half miles southeast of Gold lake, a body of water famous in the pioneer history of this part of California. The mine is at an altitude of about 7900 feet. Major Mason, J. C. Knickrem, N. Frayer and two other gentlemen each own a one-fifth interest in the property. Recently a shaft was put down forty feet heside the vein aud a crosscut into ore made. The ledge is estimated to be thirty feet wide. Previously Major Mason had run a tunnel 136 feet lower than the shaft to tap the lode. This was driven in 600 feet and to within 115 feet of the shaft. The body of ore is said to be immense and is considered to be on the "mother lode" of that county, of which the Young America mine forms a part. About two feet of the vein next to the hanging wall is a very peculiar ore, embracing galena and copper-silver glance. The owners think it is fabulously rich and confidently assert that it will produee from $50 to $60 per ton.

On Monday, Messrs. Frayer and Knickrem purchased the Huntington mill at the Bushman mine, near Quincy, and are moving to the "Bull of the Woods." They will push work on it, and they expect to have it in operation in about three weeks. The property is only a few miles south of Mohawk valley.

Siskiyou.

GOLD.—Yreka *Journal:* Last Friday B. G. Reeder and A. B. Jenkins called at this office and exhibited to us two ingots of bright gold, valued at $2000—one of $1200 and the other $800, made from gold taken out of a quartz ledge at Fool's Paradise district, between the Anderson grade and Shasta river, south of the Klamath river. Seventy-one pounds of quartz, washed clean, was pounded up in a mortar from the ledge and assayed $1,709.92, at rate of $18.875 an ounce. This is about the richest quartz district in the county, hut the ledges are supposed to he pockets, and no mill will he put up until the certainty of a permanent ledge is assured hy further development.

P. Kiernan has a force of men at work tunneling to his ledge in the Butteville district, west of Igerna, expecting to strike the ledge soon. A hody of hlue rock about three feet wide hetween regnlar walls has been found at the surface, which is helieved to be the upper portion of a well-defined quartz ledge. Other owners of ledges in the same district are waiting to see what Kiernan's mine develops in the way of gold-bearing quartz.

Trinity.

CHLORINATION.—Redding *Free Press:* Hart's sulphuret ore in his Bullichoup property is heing worked by the chlorinating process. Glen Hart is doing development work on the extension to the Orient and Occident in the same district.

At Trinity Center the Shoemaker combine was offered $90,000 for their property hy Captain James of the Uncle Sam mine. The offer was declined.

Late advices from Cinnabar indicate that

the Altoona will get their furnaces and pumps in readiness for a winter's campaign. The masons are making rapid progress with the furnaces.

Reports from Junction City, Trinity county, report iron pipe for the French company's hydraulic mines, piled up everywhere and being put in place for winter's work. Over 150 tons of pipe have been received thus far. Hydraulicking will begin with the first rains.

A GOOD CLEAN-UP. *Journal:* This week Grant Day brought in a bar containing $1200 as a result of crushing about 100 tons of ore from the Enterprise mine in the East Fork district. The mine is looking first rate, there being a good body of ore in sight.

Tuolumne.

SEMINOLE. *Calaveras Democrat:* We are pleased to note steady and positive progress of the Seminole Consolidated Gold Mining Company of New York, the directory of which in this county consists of Commodore Shaver, president; Col. Jack Coles, manager; Mr. D. H. Coles, secretary. The group of mines recently purchased by this company consists of Young America, May Flower, Georgia, Buckeye, Lena Bell, Seminole and Worcester. This group commences at the southerly boundary of the Lady Washington mine and runs northerly a distance of over 8,000 feet. Col. Coles has one mill of ten stamps in operation crushing ore from the Seminole mine, and the results of the crushing are very encouraging. The sulphurets of this and all the mines assaying not less than $40, and as high as $250 per ton. Free gold is clearly visible in the ore from every mine. In the spring the Colonel and management intend building two new mills of thirty stamps each. The ore for said mills is to come from the Worcester, Buckeye and Lena Bell. The ore will be conveyed to the mills by tramways.

The Bonita, Providence and Consuela mines on the south fork of the Tuolumne river are being retimbered preparatory to active operations.

The Eureka mine at Summersville at a depth of eleven hundred feet has developed ore that pays $200 per ton.

Messrs. Ed and Wm. Hensley of Whisky Hill, have, with characteristic energy, gone down into the depths of the Little Gem mine, once supposed to be worked out, and after six months have developed a rich chute and taken out 200 tons of rock of fine quality. As soon as water comes they will start the mill of ten stamps.

The Crystalline mine near Jamestown, owned by Chancey Wetmore and Daniel Secber is now showing well. These enterprising gentlemen have taken out 400 tons of pay rock, and as soon as water runs will start the mill of twenty stamps to crushing.

The Golden Rule mine south of Quartz mountain is being re-timbered and put in order for vigorous operation. Conjunctively with that work a long tunnel is being run which will tap this heretofore wonderful mine at a great depth.

Mr. Alex. McDonald of the Hyde mine above Sonora, reports that their mill of ten stamps is running steadily day and night on good pay ore. The main shaft is down 450 feet. The lode at that depth is sixteen feet wide. The operations at the mine are of a vigorous character and twenty men are constantly employed.

SOLD.—Tuolumne *Independent:* The Crystalline mine is sold on a six months' bond. A deposit of cash has been paid, balance of purchase money to be settled within the above time. The Crystalline is situated on the mother lode, south of Table Mountain and the Alabama mine, which it adjoins. The Crystalline is a double property, being 1200 feet wide and 1080 feet in length; has a fifteen-stamp mill, with numerous other houses on the property, all enclosed by wire fence. There are two tunnels entered, one at the south and one at the north end of the mine, but in neither case have the main lodes been intersected. This will probably be the first work to be accomplished. The croppings on the mine are very bold.

NEVADA.

Silver Star District.

THE FIRST GOLD BAR.—Walker Lake *Bulletin:* Last Friday a bar of gold bullion valued at $1000 was shipped from Silver Star to the Mint. This is the result of the first cleanup of the new mill. We are not informed how many tons of ore were worked, but it is believed that not more than fifty tons were put through, and most of this was known to be of low grade. It was put in as a starter for the mill. We have heard a good deal about the first gun of the campaign, but this is the first gun of the Silver Star mining district, and it is of vastly more importance to our people than forty campaigns. The mill is a success. The water supply is said to be sufficient. Several valuable mines are exposed to view, and if Silver Star does not hum with life and activity within three months, all signs will fail.

Washoe District.

SAVAGE.—Virginia *Enterprise:* On the 1100 level in the north lateral drift, started from the east drift, they continue to extract ore on the sill floor upward to the fifth floor. The south drift started from the face of the north lateral drift, was advanced ten feet; total length fifty-one feet. Face in quartz giving some fair assays. During the week we have hoisted fifty-seven cars of ore. Car samples averages $23.40 per ton. On the 1050 level the south drift started from the east drift thirty feet from the south ore slopes was advanced nine feet; total length thirty-seven feet. Face is in quartz giving some assays. The west crosscut started thirty feet north of the south boundary was advanced ten feet; total length fifty-eight feet. Face in quartz and porphyry. On the 1100 level the north lateral drift from the station was advanced eight feet; total length 359 feet; face in clay, quartz and porphyry. They are cutting out on the west side of the drift to upraise and sink on the ore mentioned in last weekly report.

POTOSI.—Crossent No. 5, started from the south drift, 450 level, was extended seven feet; total length eighty-one feet. Face is clay and porphyry. A major portion of the time was occupied in repairing where necessary in the south drift.

We have started a winze from this south drift, 200 feet south of the main line, on the ore streak cut in running the drift. It is down seven feet and the bottom shows a width of about two feet of ore giving fair assays. At the croppings the northwest drift from the shaft has been extended a total length of forty-four feet; face in low grade quartz and porphyry.

CROWN POINT.—On the 600 level we have started a north drift from the main east crosscut and are out ten feet; face in quartz with bunches of porphyry through it and yields assays from $6 to $8 per ton, nearly all gold. Have extracted from the stopes below the 700 and 600 levels and from the openings above the latter level during the past week, 412 tons and 1180 pounds of gold ore which has been shipped to the Mexican mill for reduction, the average battery assay of which was $8.55, of which $7.58 was gold.

S. N., M. & U. SHAFT.—The east crosscut from the north lateral drift, 150 feet north of the west drift, 1520 feet west of the shaft, 900 level, has been advanced during the week twenty-four feet; total length, 120 feet; face in quartz, clay and porphyry.

The west crosscut from the Union Con. south lateral drift from the west, 1520 feet west of the shaft, 900 level, has been extended twenty feet during the week; total length, 122 feet; face in clay and porphyry.

UNION SHAFT.—East crosscut from the north lateral drift, 450 feet north of west drift, 1520 feet west of shaft, 900 level, has been advanced during the week twenty-four feet; total length 120 feet; face in quartz and porphyry. The west crosscut from Union Con. south lateral drift from west drift, 1520 feet west of shaft, has been extended twenty feet during the week; total length, 122 feet; face in clay and porphyry.

BELCHER.—Twenty tons of fair-grade ore were hoisted during the past week.

SILVER HILL.—During the week we have sunk the winze eleven feet; total depth forty-five feet below the fifty level. From the bottom of the winze we have started a drift south on the ledge, which is now out five feet; face shows three and a half feet of ore assaying from $15 to $20 per ton.

SIERRA NEVADA.—The northwest drift at a point 160 feet west of the mouth of the Layton tunnel, is out fifty-five feet; advanced forty-five feet during the week; face in porphyry and quartz.

The east crosscut No. 1 from north lateral drift No. 2, at a point 140 feet north of intermediate tunnel, is out thirty feet; advanced eighteen feet during the week; face in quartz and porphyry.

CHOLLAR.—The upraise from the west crosscut thirty feet south of our north boundary line, 450 level, has been carried up a total distance of thirty-three feet, where the pay narrowed.

On the 555 level the main north drift has been cleaned out and retimbered fifty feet for the week.

Repairs to the 650 level station are approaching completion.

WARD COMBINATION SHAFT.—The west drift from Ward shaft, 820 level, was advanced ten feet during the week; total length, 1152 feet; face in soft porphyry with a slight seepage of water.

BULLION.—The west drift from the Ward shaft, 820 level, has been extended ten feet during the week; total length 1132 feet; face in soft porphyry and clay with a slight seepage of water.

ALPHA.—During the past week have cleaned out and retimbered fifteen feet of the shaft below the 382 level; total depth of shaft cleaned out and retimbered, 402 feet.

OREGON.

BAKER COUNTY.—Bedrock *Democrat:* More development work has been done on the mining properties during the present year of 1894 than at any other time in the history of Baker county, and the work thus prosecuted has been attended with good results in placing before the eyes of the outside world properties that will pay big dividends on the capital invested in their operation. Men of wealth are becoming interested and taking hold of our mines with the intention of erecting works for the proper treatment of the ores. A great many of the properties discovered and developed this year are bonanzas, the rock carrying free gold and many assays made running up into the thousands of dollars.

The great amount of development work done on mining properties the past spring and summer will, we predict, be amply rewarded during the coming spring and summer of 1895 by the investment of a large amount of capital by men of wealth who have an eye on Baker county mines and who are eager to invest in developed properties, and thus place this rich mineral belt where it properly belongs as the best bullion producing camp in the west.

A LUCKY FIND.—Johnny Hughes, of Susanville, made a lucky find not long since within the mineral belt of Susanville, which is pronounced by all old-timers to be an extension of the famous Cabell mine.

The ledge discovered is in range with the one on the Cabell property, and the ore resembles it very much in every particular. Mr. Hughes is at present engaged in driving a tunnel on the property. The ore taken out is very rich, gold being visible to the naked eye in a great portion of it.

A TRIP TO THE MINES.—Jos. A. West, superintendent of the S. V. R. R., returned yesterday from a trip to the Greenborn mountains and gives a glowing account of the mining interests in that section. The mines are being worked to their fullest capacity now, owing to the cheap rates given by the railroad company of $6.75 from McEwen to Tacoma and Everett, Wash. With this rate the mine owners can now realize a profit from their ore shipments and it gives a new impetus to the district.

BRITISH COLUMBIA.

MINING DEVELOPMENT.—Kamloops *Sentinel:* The year 1894 has been remarkable as the one in which more advancement in mining has been made in British Columbia than during any year of the past. What were but prospects in the Kootenay have become mines, and ore is being shipped regularly and in large quantities. In southern Kootenay both quartz and hydraulic claims have been developed, while the quartz claims of the south Okanogan have become producers. Several hydraulics are working successfully in the Fraser river valley, while others have been put in order for next season's work. Preparations have been made for dredging the Fraser and Thompson rivers, and these plants will be in operation early in 1895, if not before this year has expired. Work has also been done in Big Bend and Similkameen, and the Kamloops district has not been behind with a shipment made of silver ore from the Homestake, and the Glen Iron mine is likely to resume. Next year will probably see the output of precious minerals from this province almost, if not quite, equal to the largest yield recorded. It seems quite apparent that the second era of British Columbia prosperity is just commencing.

ALASKA.

BERNERS BAY. Alaska *News:* At the mill and mines of the Berners Bay Mill & Mining Co. all is activity and bustle. The lumber for the addition to the mill to make room for a battery of 20 additional stamps has been sawed at the company's mill and transported to Seward City. The building for the steam air compressor at the mill is under construction, and the house for the water compressor to run the Burleigh machines at the Comet mine will also be built this month. Thomas S. Nowell, president of the company, intends to hurry work so that the mill's addition and enlargement of the battery will be completed by December 1st. Work is progressing on the 450-foot tunnel to tap the Bear, Opbir and its group of mines. The boarding house at the Comet mine, 25x50 feet, is completed, and the men have moved into their new quarters. The Rustler left Monday with the scow Onyx loaded with the twenty stamps, dies and belt connections of the battery for Seward City. Mr. Nowell took a half-dozen of miners along to increase the force at work. The late clean-up at the mill from the Comet mine ore exceeds all previous ones and gives eminent satisfaction to the company.

Messrs. S. Bonnifield and Willis Thorp are pushing work on the Bennett mine in the Basin. They have now a Burleigh drill driving into their main ledge, and with every blast, the quartz is piled up in shape to be sent to the Ebner mill. They have been making a fine showing this season, and should the snow storms hold off for another month, their returns will amount to a good round sum.

Ore is being transported night and day from the Ground Hog mine to the Nowell mill at the rate of 150 tons every 24 hours. The mill is running steadily under the management of Ed. Callahan. Should the miners be able to take out ore this month, the mill will be supplied to run on ore during November and part of December.

Jack Arvey is making rapid progress at the three pits of the Takou Consolidated mine, and his force of thirty men is taking out quantities of well-mineralized quartz, which pans out very satisfactorily at the mill. He will take out ore as late as the weather will permit.

UTAH.

MARYSVALE GOLD STRIKE.—Salt-Lake *Tribune:* Mr. F. S. Mount of the Monarch Mining Company is in from Marysvale with reports of what is regarded as the biggest strike of the year in that locality. The strike was made about two weeks ago in the old tunnel of the Copper Belt mine. The company had been at work all summer on the tunnel, driving it in about 300 feet farther than it stood when closed down last year. At a penetration of about 500 feet a body of gold-bearing ore was encountered which assayed from $15 to $18 per ton, with very little silver. Up to the time Mr. Mount left Marysvale a few days ago the crosscut had not been completed, so it was impossible to estimate the width of the lode. Experiments are now being made as to the best manner of treating the ore. It seems hard, and may even require cyaniding. As soon as the method is determined the company will proceed with the erection of milling machinery.

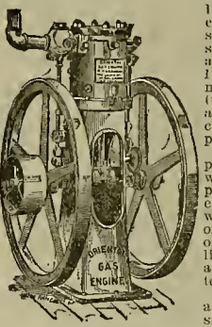
MEXICO.

JESUS MARIA MINES.—El Paso *Herald:* Uncle John Tabor, brother of the Colorado ex-Senator, has been in town, en route from Denver to the Jesus Maria mines, 500 miles west of Chihuahua. He says that the mines are looking well, and the bullion output is from $150,000 to $175,000 per month for the district. It takes six days to reach the mines from Chihuahua, half of which must be traveled with burros and the road for the last half of the distance is mighty tough going. Mr. Tabor has a high opinion of President Diaz, whom he considers a wise and most excellent executive. But he fears an uprising in northern Mexico in case of re-election, as for some reason the Spanish dons do not like the present administration.

MINING

DIPLOMAS AWARDED. Courses in other trades, all including thorough instruction in Mathematics and Physics. Send for FREE Circular, stating subject you wish to study, to **The Correspondence School of Mines, Scranton, Pa.**

The Oriental Gas Engine



IS THE BEST because it combines simplicity of construction with power and economy of space. It can be run with natural or manufactured gas or gasoline at a cost of 30 to 35 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

M. A. GRAHAM,

Inventor and Manufacturer,

105 Beale Street..... .....San Francisco.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Messrs. J. S. Gould and F. M. Spencer in the Holloway mine, near Gibsonville, Plumas Co., Cal., and to impound tailings behind log and brush dam in a ravine below the mine; from W. A. Morse in the Mugginsville mine, near Eureka North, Sierra Co., to impound tailings behind a cob dam in Eureka creek; and from John R. Jones in the Waukshaw mine, near Relief Hill, Nevada Co., to impound tailings behind rock dam in Logan canyon, gives notice that a meeting will be held at Room 92, Flood building, San Francisco, Cal., on October 29th, 1894, at 1:30 P. M.

Double Acting Cornish Plunger

Pumps twice as much water as the old Cornish pump and "only one-third the weight."
SPECIAL CONSTRUCTION OF STEEL for packing on mules, only one-twelfth the weight of the ordinary Cornish Plunger.

IMPROVED SINKING PUMP.

Bucket and clack changed under water, saving expense of putting down another pump when the bucket or clack gives out under water. Bucket gearing lasts six times as long as the old gearing.
First outlay one-third less and works with ten per cent less power, "paying for itself in one or two years, according to the price of fuel."

WM. NANCE.....Grass Valley, Nevada County, California.

Electrical Progress.

Direct Current Lighting at High Pressure.

The *Engineering Magazine* notes that one of the most unique and technically ingenious plans for lighting a town of moderate size which has come under its notice is that which has for the past two years been in operation in the university town of Oxford, England, and was described by Mr. Thomas Parker in a paper before the British Association. The conditions which confronted the projectors of this plant were by no means favorable to economical or profitable results, and no small credit is due the engineers by whom they have been so successfully met. In Oxford, the principal consumers are the colleges, and hence anything like a full load can only be obtained during term time. There is a maximum load for even half the plant only during some eight weeks in the year, and hence the system must necessarily be very elastic to be able to show even fair results. It was also necessary to locate the generating station at a distance of 4500 feet from the center of the area to be lighted, which of course compelled the employment of high pressure currents. After much consideration, a high pressure continuous current plant in conjunction with motor transformers and storage batteries was decided upon. At the power house the currents are generated at an e. m. f. of 1050 to 1100 volts, and are thence conveyed to a distributing station, through two pairs of mains insulated with India rubber, laid underground in iron pipes. Each motor transformer consists of a field magnet aud an armature with primary and secondary winding, having a commutator at each end.

The secondary mains are made up in two sizes in the form of armored cables. These are laid in a trench under the sidewalks, and are provided with disconnecting branch boxes, so that any section or street can be cut out. The high tension feeders to the transformers are of similar cable At present seven motor transformers are used in five sub-stations.

The storage battery at the distributing station is capable of sustaining a discharge of 120 amperes for eight hours, and takes care of the load from oue o'clock A. M. until half an hour after sunset. The battery is charged by a small motor generator, giving an output of 100 amperes and 33 volts from its secondary armature, being supplied from the secondary mains at an e. m. f. of 103 volts on its primary. The 33 volts from the secondary armature is put in series with the secondary mains, giving an aggregate of 136 volts, which is sufficient to charge the cells. This is found to be more economical than charging from the secondary mains with a regulating resistance, the total efficiency being 92.5 per cent. At the generating station three inverted triple-expansion condensing engines are employed, running at 125 revolutions per minute, and driving three separately excited Elwell-Parker dynamos, each having a capacity of 80 amperes at 1100 volts aud 400 revolutions. These are connected to bus-bars, so as to be run singly or in parallel as required. The "load-factor" of the station works out only 5.93 per cent. By this technical expression is understood the ratio of units of currents sold to units that could be sold with the lamps always on, viz":

$$\frac{\text{Mstered watt-hours x 100}}{\text{Mean watts installed x number of hours in the year.}}$$

For the greater part of the year only about half load for one engine is required, and in view of this fact the following results of the year's work from July 1, 1893, to June 30, 1894, must be regarded as quite remarkable. The aggregate kilowatt hours generated were 195,022, and the total metered 122,081, of which 18,303 were supplied for public lighting, and 2019 k. w. h. were used at the distributing station.

The total efficiency of the system was 64.6 per cent; that of the transformers 76.7 per cent, including loses in mains and resistances, and that of the battery 43.9 per cent. The total kilowatt hours unaccounted for were 6976 units, or not quite 5.5 per cent. Omitting this loss in computation, the coal used amounted to 6.43 pounds per k. w. sold, costing .752d (1.5 cents) per k. w. The number of 8 c. p. 35-watt lamps installed was 5060 at the beginning and 7774 at the end of the fiscal year. The The total cost of all generating expenses, including rent and taxes, was 3.715d (7.43 cents) per k. w. delivered to consumers. The total revenue for the year was £3715 8s. 2d., or approximately $15,000, the k. w. consumed averaging 18.2 per lamp throughout the year, for which the average price obtained was 7.3d (14.6 cents) per k. w. h. It is doubtful if another station can be found in the world of such small capacity and with such wide variations of load in different parts of the year, which can make so good a showing.

Electrical Equipment of a Luxurious Yacht.

The ocean yacht building at the Bath, Maine, iron works for Wm. Slater, of New York, might be called a gem if it were not for its size. In an electrical point of view it will be made, on occasion, a marvel of brilliancy. As to the boat in its appointments other than electrical, suffice it to say that $300,000, exclusive of furnishings, gives an idea of what a boat it may be. The electrical apparatus is on the same plan, the best regardless of expense. The plant, installed by J. A. Trates for the General Electric Company, consists of two 4-pole, 80-volt, 190-ampere direct connected machines, making 400 revolutions a minute. Sturtevant engines are used. At ordinary times one engine and dynamo will carry the whole load. For this purpose the circuits are arranged in a novel manner. The circuits feeding the lamps inside the vessel are connected to one machine, the search light, signal lamps and decorative circuits are on the other, when the main knife switches are down. If now a knife switch is pulled, the dynamo circuit is first broken and its load, when the switch is thrown way up, is transferred to the other machine. Before the change is made the total number of lights on all the circuits is reduced to the capacity of one machine. The wiring is concealed by specially designed moldings in some cases, but is generally put out of sight without that help. The bell wires are like the others, Grimshaw, and laid in the same manner with carefully soldered joints. The switchboard has two enameled rheostats by the Bridgeport Electric Company. There is a Weston station ammeter for each machine and a voltmeter. A novel featurc of the lighting of this yacht is two illuminating belts, to be used on the main boom and from the bowsprit over the masts. The search light has electrical connections through rings concealed in the base. The lamp can, therefore, be turned round and round without interfering with connecting wires. The illuminating belts of lamps and the search light will make the yacht a wonder by night as well as by day.

A British View of Our New Tariff Bill.

I have noticed "The American Tariff" as a headline in my paper every morning for weeks past. Sometimes it has headed a paragraph of a few lines only, and sometimes a column or more. I have many times tried to make out what it is all about, and what has really been done by the House of Representatives, the Senate, the Finance Committees, the Foreign Relations Committee, etc., and what would be the effect of Senator Murphy's resolution.

Now and again a leading article has appeared and I have hoped to gaiu some enlightenment therefrom. Usually, however, the writer of the articles has evidently been as much at sea in his deductions as I have been myself. The fact is that it takes a born American to understand the working of the legislative machine at Washington and to distinguish between bluff and business.

Having just had an opportunity of glancing at the bill for a few minutes, I hastily looked to see how it is likely to affect English electrical manufacturers. Nowhere, however, could I find anything concerning electrical manufactures. For instance, under the heading "Copper" there is given the tariff on sheet and bar copper, but wire is not mentioned. Under the heading of "Wire," iron and pianoforte wire alone are mentioned. There is no special heading for machinery, either electrical or otherwise, although steel ingots, forgings, boiler plates, etc., are dealt with. Electrical manufactures would, therefore, appear to come under the following clause: "Manufactured articles or wares, not specially provided for in this Act, composed wholly or in part of any metal, and whether partly or wholly manufactured, thirty-five per cent ad valorem."

Incandescent lamps will probably have to pay at the same rate; as, whether the minute piece of platinum which they contain is sufficient to bring them under the above clause or not, does not matter, seeing that "all manufactures of glass, or of which glass is the component of chief value, not specially provided for in this Act," are also subject to thirty-five per cent ad valorem.

Thirty-five per cent ad valorem is, however, a considerable reduction, as the present tariff is forty-five per cent. What the effect of this reduction will be, so far as concerns English electrical manufacturers, it is too soon to discover. It appears to me, however, that the reduction is not enough to be of any very material consequence. Certainly there is no ground for any great rejoicing.

Under the Act our American cousins will, for the first time, have the pleasure of paying an income tax, and, as a set-off against this, they have placed the following luxuries on the free list: Balm of Gilead, Bologna sausages, cider, old copper (electrical manufacturers please note), curling stones or quoits, and curling stone handles, dividivi, old junk, manna, sauerkraut, sausage skins, snails, yams and zoffer. —"Meteor" in London Lightning.

J. F. CROSETT,
Commission Mine Broker,
628 SACRAMENTO STREET.
I have five customers looking for income-paying mines for London, to be valued from $300,000 to $5,000,000. I also want ten income-paying properties for customers residing in San Francisco, Chicago, Denver, New York and Philadelphia. Owners of mines desiring to sell can make quick sales by seeing or writing me. I also invite investors to consider properties I have to offer.

GOLD MINE
FOR SALE.
First class in every respect. Large body of ore in sight. Ten-stamp mill. Producing good profit every month. Former owner dead and heirs desire to close estate. It has a six-foot vein, $10 ore. See
J. F. CROSETT, 628 Sacramento St., S. F.

The Russell Process.

Practical Information.

Soldering Aluminum.

Those who have occasion to use aluminum, either in their private experimenting or as a building material, for which, as it seems to us, it is destined to have many applications, may like to know how to solder it with the tools usually within an amateur's reach. As every one who has anything to do with aluminum knows, it is considered very difficult to solder. Ordinary solder when melted runs over it like mercury on a glass plate, and cannot be persuaded to stick to the surface of the metal by any of the usual methods. No flux known will help the matter any, for the reason that the oxide of aluminum which covers the surface is a thin film, is insoluble in any re-agent which will not attack either the metal itself or the solder. There are plenty of recipes, in accordance with which those who are willing to pay $1 a pound for "aluminum solder," and an extra price for "shop rights," may have the privilege of trying to make the "solder" stick to the aluminum, but amateurs will generally find it quite sufficient to use ordinary block tin for solder, and secure its adherence to the surface of the aluminum by rubbing the metal through the solder, which is melted upon it by a spirit lamp or a Bunsen burner, with a wire brush, which removes the oxides so effectually that the melted tin can be spread over the aluminum almost like paint. The best brush to use is one made of bits of aluminum wire, wound with wire or set in a handle, but steel or hard iron wire will answer. After both the surfaces to be united have been "tinned" in this way, they are held together and heated until the tin melts. The joint is so strong that the aluminum will sometimes break before it will separate from the solder; and, as block tin is very fusible, the work is easily managed by amateurs. Ordinary plumbers' solder, which contains a large amount of lead, should not be used. Lead has a curious repulsion for aluminum, and, although solder containing it can with difficulty be made to attach itself, by means of the wire brush, the joint would be unreliable. If it is desired to harden the solder, silver may be added. It will dissolve readily in the melted tin, and the resulting alloy, which is harder and somewhat less fusible according to the proportion of silver than the pure tin, can be spread with the wire brush with the same facility.—Engineer and Iron Trades' Advertiser.

The Removal of Iron Parts Shrunk on Hot.

A method for instantaneously removing iron parts shrunk on hot, like a crank on a shaft, has been communicated by M. Raffard to the Bulletin Technologique of the French Societe des Anciens Eleves des Ecoles Nationales d'Arts et Metiers. An endeavor had been made to take off the outer hoop of a Laval turbine by heating it with a gas blowpipe; but the heat was communicated too quickly throughout the whole mass to give a sufficient difference of expansion in the hoop alone, so as to loosen it, and there appeared no alternative but to cut it. In such a case, M. Raffard recommends that molten lead be run round the part to be detached—a method he applied with success in 1860 at the Soho foundry, Melbourne, in removing a crank that had been shrunk on a shaft eight inches in diameter.

The Passing of Red Brick.

In no department of human industry, says the Washington *Post*, has there been greater evolution of late years than in the business of making bricks. Formerly we had nothing but old-fashioned red brick that reached its climax of perfection at Philadelphia, and was shipped thence at great expense all over the country where a high-grade article was in demand. But the red brick has had its day for architectural use, and in its place has come to stay the brick of lighter hue—pink, buff, yellow, and, in fact, of nearly every shade.

A brick can be made that is as mottled as a sea-gull's egg, or one that will show the varying tints of an autumn leaf. It is done by adding certain metallic ingredients to the clay after the latter has been ground to the finest powder. It is the iron in the clay that gives the ordinary brick its deep red. In future most of our city residences are going to be constructed from brick of these pleasing colors. They give relief to the eye and variety. What can be more monstrous than a row of red brick houses? Washington is taking to the new style, and in this clear atmosphere, unspoiled by the soot from soft coal combustion, a house of this beautiful material will stand fresh for a century and be solid years after one made of granite had disintegrated.

Manufacture of Plumbago.

Graphite crushed and passed through a sieve of from 120 to 150 meshes per inch is stirred into a saturated solution of alum or aluminum sulphate at 212° F.; steatite is then added, and more water if required. After mixing, excess of water is evaporated until a consistency suited to grinding in a chilled steel or other mixer is obtained. More graphite may here be added; then, after thorough grinding, the material may be compressed into cakes for household use or is ready for the manufacture of pencils or crucibles. The average formula for the mixture is: Graphite, 80; steatite, soapstone, or talc, 14; alum, 6; but this varies with the purpose to which the material is to be applied. When several different kinds of graphite have to be employed, the richest in carbon is first mixed into the alum solution. By this process graphites previously regarded as incapable of being compacted are utilizable, and are improved in polishing power; for pencils, the material may be hard without being brittle, and black without being soft, while crucibles made from the treated graphite are at once harder, more durable and lighter.—Scientific American.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

SAN FRANCISCO, Oct. 18, 1894.

Sales of mining stocks have been rather heavy in Comstock securities during the past few days, but prices have declined. The report of Cons. California and Virginia is a very good one indeed, but the stock is selling at what a few years ago would have been considered a ridiculously low figure, taking into account the condition of the mine and bullion product. But it is difficult in these days to arouse much of an interest in mining stocks, and investors with much capital seem to be pretty well out of the business.

Although the Cons. California and Virginia Mining Company has the large surplus in actual coin of $165,500 in its treasury and a dividend of fifty cents per share could be declared and quite a reserve left after that, the directors have deferred the declaring of a dividend uutil the surplus is much larger. When the surplus reaches $250,000 or $300,000, the matter of a dividend will be definitely settled.

At the annual meeting of the Con. California and Virginia Mining Company, the following resolution was unanimously adopted by the stockholders assembled: *Resolved*, That the thanks of the shareholders of the Consolidated California and Virginia Mining Company he and are hereby tendered the managers of that mine for the efficient manner in wbicb its affairs are now handled. That the hullion returns from ore crushed show that the management is handling the property for the best interests of shareholders. This is proven by the following returns: During September 1586 tons of ore, valued according to railroad car samples at $57.89 per ton, or a gross valuation of $91,813.54. The mill returned in hullion $52.87 per ton, or $83,879.60. The bullion returned is 91.23 per cent of the railroad car sample. The railroad car sample per ton of the ore crushed was $57.89 per ton. The battery sample average per ton was $59.24. The bullion return per ton was $52.87.

The following illustrates the changes of the week:

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ORE CONCENTRATOR.—Luther Look, Soldier, Idaho. No. 526,242. Dated Sept. 18, 1894. This is a percussion or bumping table. It has at one end a circular swinging motion, combined with a side bump, and at the other end a reciprocating end shake or motion. The table is a freely swinging triangular one having suspension devices with a pivoted longitudinally sliding connection at its head. At one side of the foot of the table is a horizontally turning notched cam having a strap in which it works. At the other side is a bumper and a spring, and between the spring and cam the table, or that end of it, is moved sidewise against the bumper, while the other end turns about and slides upon its pivotal connection. The peculiar motion at the head provides for an effective feed of the pulverized ore, thereby increasing the capacity of the machine and improving the quality of the result. The swinging motion and bump at the other end of the table produce an effective settling action similar to that of a gold pan. The mineral is drawu to one side as fast as it is settled, and the whole operation is a continuous and automatic discharge of the different classes of concentrates and the tailings.

CAR COUPLING.—Warren F. Drew, Sacramento, Cal. No. 526,303. Dated Sept. 18, 1894. This coupler is one of the hook class, and by reason of its construction can be made small and yet with sufficient strength and durability. It can be uncoupled from the top or side of the car and used in connection with the link and pin of the old styles when required. The coupling consists generally of a drawhead to receive a draw bar, swinging levers within the drawhead chamber having hooks adapted to engage the draw bar, a spring-controlled sliding rod in the back of the drawhead chamber, links connecting the rod with the rear ends of the hook levers whereby the latter are controlled, and connections for operating the sliding rod.

BOILER-FURNACE.—James Grogan of Prescott, Arizona. No. 526,485. Dated Sept. 25, 1894. This furnace consists of a shell having a boiler supported within it, and having a fire-box, the sides and back of which slope inwardly and downwardly for a short distance. The shell has also a closed chamber in the lower portion back of the fire-box, in which chamber is a tortuous passage formed by vertical partitions extending inwardly from each side and each terminating short of the opposite side. Into this tortuous passage air is admitted, and being heated therein is discharged into the space below the grate bars, to increase the draft.

TEA CHEST AND ATTACHMENT.—Cornelius Toohey, San Francisco. No. 526,511. Dated Sept. 25, 1894. The object of this invention is to provide a chest or package for the transportation of tea, coffee or other aromatic or delicate substances which it is necessary to seal hermetically during transportation; a means for transferring said package into a caddy, and a containing caddy with an attachment by which the contents are replaced to be removed from time to time at will It consists of an exterior wooden box having an opening upon one side near the bottom, a sliding movable door fitted thereiu to complete the side of the box, an interior impervious bag fitting witbin the box, a frame and shield fitting within the bottom of the bag, having an opening beneath the shield which coincides with the opening in the side of the box, whereby communication is made with the interior of the package by removing the sliding door and cutting away the lining bag in lines coincident with the opening in the box. In conjunction with this is a segmental casing having an opening made through the segmental front, and a corresponding opening through the vertical rear side, a segmental door pivoted to rotate within the casing to open or close the same, and tongues and grooves fitting corrospouding edges in the opening of the box, whereby it may be easily fitted thereto when the removable door has been taken away.

BED-CLOTHES CLAMP.—Henry L. Jessen, Watsonville, Cal. No. 526,490. Dated Sept. 25, 1894. The object of this invention is to provide a means for retaining bed clothes in their proper position during the night, so that children or restless people will not be able to disarrange them and throw them off. It consists of opposing plates, the forward ends of which are adapted to grip the bed clothes, one of the plates having its rear end upturned and a fulcrum upon the opposing plate, the other plate being extended beyond the fulcrum point and provided with a means for detachably engaging a holding loop and a means engaging both plates and interposed between the fulcrum point of the plates and the jaws thereof for adjusting the jaws and clamping the bed clothes between them.

WRENCH OR CLAMP ADJUSTER.—William J. Wright, Oakland, Cal. No. 526,476. Dated Sept. 25, 1894. This invention relates to improvements in wrenches of that class known as "monkey wrench," and similar clamping devices. The object is to provide a means for minutely adjusting the jaws and permanently locking them in position after adjustment. It consists of a bar or shank sliding in a guide or casing, independent separable plates fitted to the shank, and a trausversely movable locking plate fitted to the casing and adapted to pass between any pair of plates or be disengaged therefrom, said locking plate or bolt being provided with a combined operating arm and spring catch adapted to engage a recess or shoulder of the guide or casing and lock the locking plate or bolt in engagement with the said plates.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo, illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.

Price $6.00 postpaid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

STANDARD ELECTRICAL DICTIONARY.

By Prof. T. O'CONOR SLOANE.

Author of "Arithmetic of Electricity," "Electricity Simplified," Etc.

The "Standard Electrical Dictionary" is what the work purports to be, exhausting the subject of electrical terms, giving each little the clearness of explanation necessary to make the understanding of it complete, without unnecessary elaboration. In this work every electrical word, term or phrase will be found intelligently defined.

The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the every-day electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of the greatest science of the times.

624 Pages. 350 Illustrations.

Handsomely Bound in Cloth, 8vo. PRICE, $3. Extra Super Calendered Paper.

What is said of the STANDARD ELECTRICAL DICTIONARY.

The dictionary gives evidence of a large amount of painstaking work on the part of the author, and possesses features which must be commended. Among these, the author, wherever occasion required it, has furnished the synonyms of terms, and the book is given an additional value by an alphabetical index, which enables it to be consulted for terms both collectively and individually. The work will prove of value to the reader, whether professional or non-professional. The definitions are put tersely and concisely, so that the inquiring reader can carry away a defined, net impression as to what is meant. Any student who will spend his leisure hours over the volume will be amply repaid for his time and trouble. The book is very clearly printed in bold type on good paper, and is well bound.—*N. Y. Electrical Engineer*

Coast Industrial Notes.

—The Sonora flour mill has been leased by K. A. Steinhauser and Wm. Kruger.

—In the Mayflower mine, Amador City, a lot of good paying ore has been encountered and is being milled. The Mayflower has ordered a roller mill.

—The Southern Pacific Company has, since the recent railroad strike, reduced its clerical force by 400 persons. The company employs, in all departments, about 25,000 people.

—The Bear Valley Irrigation Works, the largest in southern California, have been purchased from the receivers on behalf of the larger creditors, who will invest further considerable sums in necessary developments.

—Interest in the recent new oil discoveries at Los Angeles is unabated. A multitude of wells are sinking, and the results in almost every case are satisfactory. Los Angeles is in a fair way to solve the problem of cheap fuel.

—The foundry at Sonora, Tuolumne county, is now casting the iron work for a ten-stamp mill for the Ham and Birney mine; revising and reconstructing an engine for the Dutch quartz mine at Quartz mountain, and doing large repairing for the Black Oak mine at Soulsbyville.

—Truckee is to have another extensive ice-storing works. A new pond is being constructed on the Marzen meadows, between Truckee and Donner Lake. It will cover an area of thirty acres. An ice-house 100 feet by 300 feet will be erected, and a crop of ice will be harvested this winter.

—Superintendent Hale of the Keystone mine, Amador county, is having a new floor put in the mill. Twenty stamps were hung up two weeks ago to make repairs, and at the same time new mortar blocks and mortars are to be put in. They recently made a great strike of a magnificent body of ore, which is more than pleasing to the superintendent and stockholders.

—The shipments of freight from California east, during the month of August, as shown by a report recently tabulated by the Southern Pacific Company, aggregated 83,207 short tons. This is the largest total for any one month in the history of the State. The shipments for August, 1893, aggregated a fraction over 50,000 tons, which total was over 4000 in excess of that for the corresponding month of the preceding year.

—The Reno (Nev.) Water, Land and Light Company is busy preparing for the winter and making a number of changes and improvements. M. J. Curtis and a crew of men are now working on one of the new flumes which will shorten the ditch over half a mile, and another one is to be built. As soon as this is completed, work will be pushed on the new electric light station, and before snow flies the company hopes to have one of the best, if not the best, systems of water and light supply on the coast.

—From Allen Mead, the Plumas *National-Bulletin* learns that at Moonlight, in Cook's canyon, about six miles above the ranch of J. F. Evans, is a large deposit of iron ore of very high grade, probably containing seventy-five per cent in mineral. Mr. Mead says it forms part of a great mountain, and would furnish a supply practically inexhaustible. Some day this deposit of iron will become a valuable property. Of course, transportation facilities are needed, as well as a supply of coal. The timber supply, however, is nearly unlimited. In that vicinity there are also deposits of native copper which have attracted much attention.

—Tunnel No. 1 of the Arrowhead Reservoir Co., San Bernardino county, is through. The total length of the tunnel as made by the opening is 4900 feet, making connections with Little Bear valley reservoir and Grass valley, where the second reservoir is to be established. The tunnel is 6x8 feet in size of opening, somewhat enlarged in places where soft rock was torn away by the blasting. There is but little timbering in the tunnel, as it is through rock all the way. Work was originally begun at both ends of the tunnel, but by the flow of water entering the upper end the workmen were driven out, and, after two years of hard labor, some of the time but two feet a day being made, the tunnel is now open. It is expected that two years more will be consumed in completing the work. Tunnel No. 1 is the largest of the series of tunnels to be constructed in order to get the water into this valley. Tunnel No. 2, from Grass valley to Huston flat, 2000 feet long, was completed some time ago. The third longest is 1700 feet in length, and the shortest 300 feet. Work upon the dam will be begun at once. This is to be made of very massive and firm masonry, in order that it may be made higher if it should ever become necessary or be thought desirable. The work now is to construct a dam 125 feet tall, and about 700 feet across at the top. This will make a basin about three miles in length and 125 feet deep at the deepest place. It is a big undertaking, but is getting on at a most satisfactory rate.

—That the ice industry is an important and growing one is evidenced by the erection of new ice-houses and the construction of new reservoirs every year. It is one of the principal industries on the Truckee river, where there is every natural facility for it. Let the State go into the business, as has been recommended by Governor Markham, of making artificial ice with convict labor and the business of storing natural ice will be killed. Hundreds of men who depend upon the wages received from that source for a part of their year's living will be thrown upon the country and made paupers of for a portion of the year. We fail to see where the State would be benefited by such a move, and we think that better judgment will prevail. Men who have invested their money in that industry have a right to consideration.—Nevada City Herald.

—There is considerable work being done on Donner creek, about one and one-half miles from Truckee, says the *Republican*. Joseph Marzen has about twenty men at work constructing an ice pond. Although the men have only been at work about two weeks, they have made quite a showing. A very substantial dam is being made. Some of the timbers used in constructing it are eighty feet long and forty inches at butt, and are fastened down by long inch drift bolts. The space between the timbers will be filled in with rock and the face of the dam will be of heavy lumber nailed down to the timbers. It is thirty-six feet long at the base, while on the top it is one hundred and fifty feet long and sixteen feet wide. This ought to hold quite a force of water. The dam will be twelve feet deep and will cover an area of thirty acres, while at the upper end it will be four feet deep. It is expected in the near future to make it twenty feet high and then it will cover an area of 160 acres.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

RUPTURE!

It has been considered by the medical profession that hernia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

THE JONES ROCK DRILL

IS THE

Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, lessee, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

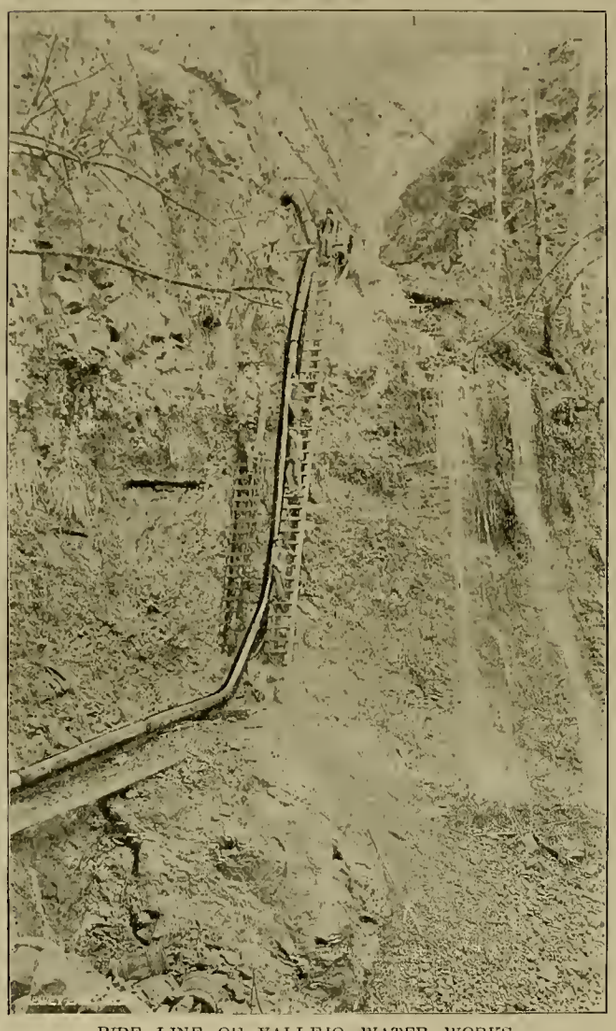
Riveted Sheet Iron Pipe Line.

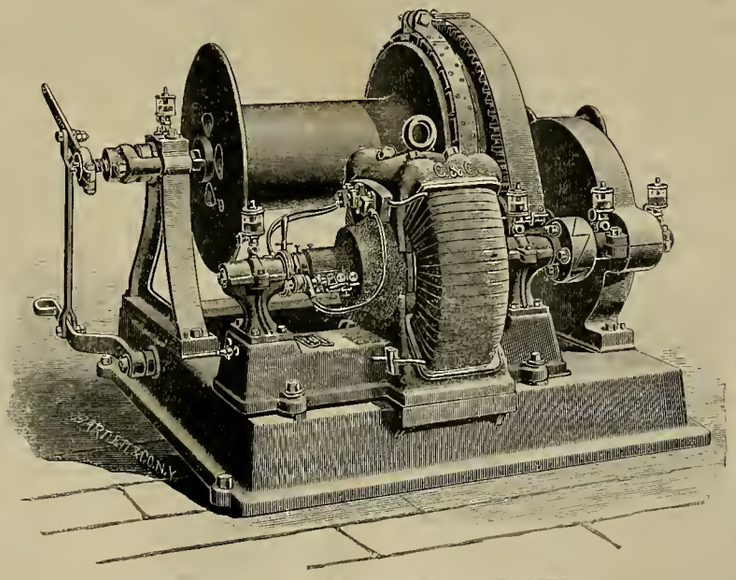
While the accompanying illustration presents a picturesque bit of scenery not uncommon among the mountains adjacent to the Bay of San Francisco, it also affords a glimpse of the pipe line which conducts water to the service reservoir of the Vallejo water works. The photograph was made near the head of the line and a little below the supply reservoir, which is some sixteen miles distant from Vallejo, on the Falls branch of the Green valley creek, at an altitude of about 1200 feet. At the point shown in the illustration the pipe is carried up the face of a cliff seventy-five feet in height. To prevent its injury by falliug rocks or trees, it was laid in a trench excavated in the solid rock and (since the picture was made) covered with cement. The length of the pipe is fourteen and one-half miles, four miles of which is twelve-inch, followed by three miles of ten-inch, in diameter, riveted sheet iron pipe, manufactured by the well-known firm of W. W. Montague & Co. of this city. The balance of the distance it is ten and eight-inch Congress lock joint. As may be inferred from the engraving, the character of the country is rough. The pipe traverses in its course a tunnel 1900 feet in length, and at points the pressure is very great, there being an inclination in some places of 78°. The pipe was put together on the ground, being conveyed thereto in sections of twenty-six feet, and is coated with a special preparation that insures its lasting quality. As a test, when complete, water was let into the pipe and held under pressure two weeks, no leakage occurring at any point, a fact which reflects much credit upon the manufacturers, while also showiug the thoroughness with which the engineering work was done. The capacity of the supply reservoir is some 350,000,000 gallous and the capacity of the pipe line 1,000,000 gallons per day, the purpose being to furnish a water supply for Vallejo and Mare Island, with a population of 7000. The cost of the plant was $280,000, including all works, right of way, etc., which was met by an issue of bonds ruuniug twenty years. Work beguu in May, 1893, and completed in July, 1894, being conducted by the eminent civil engineers of this city. Hubert Vischer and C. E. Grunsky.



PIPE LINE OF VALLEJO WATER WORKS.

A CONTRACT has been made between the Tacoma Smelter Company and the Bunker Hill and Sullivan Mining and Concentrating Company of Wardner, Idaho, by which 800 tons of ore monthly, for six months, will be shipped from Wardner to Tacoma for smelting. The ore carries sixty-five per cent of lead and thirty ounces of silver to the ton. Part of it will be sent to the Selby smelter.

THE Hidden Treasure Mining Company, Placer county, is extending the Dam tunnel, building shops, etc., and making all preparations for active operations through their uew property.



ELECTRIC HOIST FOR MINING PURPOSES.

Electric Hoists and Pumps for Mines.

Where so many of the improvements in electrical machinery are directly in the line of mining interests, power transmission, hoisting works, pumping plants, etc., it may be timely to give a brief description of some of the products of the well known electric machinery manufacturers, the C. & C. Electric Co. of Garwood, New Jersey. The company has always been run upon conservative lines, so that no work is turned out that is not thoroughly up to the standard. Their dynamos and motors are unique in structure, and being compact and efficient they are especially adapted to mining work. The field magnet is of a circular form, consisting of two segment shaped cores solidly bolted to heavy cast iron pole pieces, the bottom pole piece being made of one casting with the bed. The cores are of the best steel casting, with flanges at the end for holding the coils in place. The use of steel castings for the field cores was decided upon after exhaustive tests by the C. & C. Electric Co., and has proved of great advantage. The center of the circle encircling the field magnet coincides with the center of the armature shaft, thereby making a most compact symmetrical and solid machine.

The field coils are wound directly on the cores by hand, and, the wire being under continual inspection during the winding, defective insulatiou is impossible.

The armature is of the drum form, built up of sheet iron dises prepared by a special process to prevent heating from the Foucault currents. These dises are compressed in a powerful hydraulic press and held together by longitudinal bolts passing through the plates which are keyed to the shaft. The bearings, commutator, brush holders and all the parts are made after the latest and most improved methods.

The above is a brief description of the bipolar dynamos aud motors for ordinary work. The design of the machine is the same when used with pumping apparatus, hoist or ventilating machinery. The motors are made in combination with pumps of various sizes, ranging from 1½ to 12 inches cylinder, and having a capacity of from 200 to 900 gallons per minute at a pressure of sixty pounds. The C. & C. pumping combinations are in use in many large plants all over the couutry, notable among which is that of the city of San Autonio, Texas, which has been in operation since February, 1893, giving perfect satisfaction. The plant consists of three triplex Gould pumps geared directly to three C. & C. standard motors of thirty H. P. each. The total capacity of the station is 2,250,000 gallons per day.

In connection with hoisting machinery, the C. & C. motor has also obtained an enviable reputatiou. The hoists are built to withstand the rough usage that such machines are liable to, being simple and compact in construction.

The Miners and the Laws.

The priucipal topics of discussion before the State Miners' Couvention next month will doubtless be: The Newlands bill; The unjust department ruliugs with relation to mineral lauds; Improvement on methods of obtaining title to mineral lands; aud, Government aid to the rehabilitation of hydraulic mining. All of these are of the greatest importance to the mining industry and need intelligent discussiou and conclusion before being called to the attention of Congress, the only body which can afford a remedy.

It is, however, highly probable that radical chauges may be made, not only iu the laws themselves, but in the department rulings under these laws, provided the miners properly formulate their statemeuts for presentation to the congressional committees. But the miners must work together in the commou cause to accomplish any good results. The annual convention of the Califoruia Miners' Association affords a fittiug opportunity for discussing these subjects and for petitioning Congress for relief from the existing evils.

The Stewart mining bill, which persistently appears at each session, but thus far has fortunately not become a law, is by uo means what is wanted. It limits the amount of mining ground which can be taken up and patented under one patent to so small an area that the drift miuing iudustry of this State—a very important branch of gold mining—would be greatly hampered. This has been repeatedly poiuted out to Senator Stewart aud the reasons given, but he still persists iu retaiuing the objectionable clauses in his bill, notwithstanding the earnest protests of the miners of this State.

The Newlauds bill, which was drafted by a committee of the State Miners' Association, aud introduced at the request of that body, is designed as a substitute for the Stewart bill, and therefore needs the earnest advocacy of the mining community. It is drawn in the interest of both quartz and drift miners.

As far as the unjust rulings of the Land Department are coucerned, their evil effects on the mining industry have been repeatedly pointed out in these columns. It will take the united efforts of the miners of the country to make any impression iu this direction, as the departments are bound up in precedent and red-tape so tightly that it is doubtful if they can take the proper view of things even if so disposed.

But their precedents should be upset and their red-tape cut so as to free the mining iudustry from the unnecessary burdens under which it is at present laboring. This can be accomplished by keeping at it loug enough and persistently enough. Ordinary remonstrance has gone on for years, and it is time now for vigorous united efforts to remedy the evil.

As to the present system of obtaining title to mineral lands, it is cumbersome, expensive, slow, tedious and vexatious. The miner has to pay twice as much for his ground as the agriculturist, and wait about six times as long before he can get his title. The general plan and the details are all of the Circumlocution Office type and apparently designed to prevent men getting title rather than to aid them. The whole system wauts chaugiug.

As to Government aid toward the construction of dams in the rivers to restrain mining debris, that is a topic which will take serious consideration. The hydraulic miuers made a hard fight for recognition and finally obtained it, and it may be that they will be able to accomplish something further.

Our Auriferous Beach Sands.

While in other parts of the world, notably in Australia, they have made a success in continuously working deposits of beach sands, it is on this coast an intermittent industry, and not a very profitable one at that. On the coast of the northern part of California and southern Oregon are the most extensive deposits, and quite recently there has been renewed interest in their development. Some companies are just now beginning to work the Oregon beaches on a larger scale than formerly. Up in Alaska beaches are worked every year aud yield some profit. In the southern part of California, at the beach near Lompoc, a few years ago there were a hundred or two men at work, but last year the claims were not operated.

The gold found on these beaches is exceedingly fine and flaky and difficult to save by the ordinary methods of gold washing. The heavy black magnetic sauds are almost of the same specific gravity as this flaky, thin gold, so there is much loss in the ordinary sluice. But the main practical difficulty seems to be that there is less gold per ton in the sand than is generally supposed. Occasional spots may be found where the sand will run $15 or $20 per ton, but these are scarce, and generally found after storms when the ocean waves have concentrated the gold on the beach.

The general run of the beach sand is more nearly $1.50 to $3 per ton. Takiug it as it comes, it will hardly reach the figure of $6.82, as stated by Mr. Paul in his article in the PRESS of the 13th inst. A new beach, hitherto unmined, or one which has been unworked for some years, may reach such a figure, but most of the beaches where the sand is fouud have been more or less worked during the past forty years. There are known deposits, it is true, which have been hardly touched. That at the big lagoon on our northern coast is quite extensive, but has paid very little of late.

A great many plans have beeu suggested aud tried to make this beach sand industry profitable on a large scale, but none have been unqualifiedly successful. Only two years ago the Portland amalgamator, which had been successful on the fine Snake river gold, was taken to a large deposit of black saud back from the beach of Monterey bay. With this was used a magnetic separator, arranged to handle 1000 tons of sand per day and to set aside 700 tons of magnetic iron saud, leaving the gold in the light sand, which was then to be worked by the amalgamator. The trouble with this plan was, the gold was to pay expenses, and the profit to come from the sale of the magnetic iron. But this could not be sold here. There was no market for it whatever, and there was nothing in shipping it. The enterprise was therefore not a success.

A new plan of treating these sands is suggested by Mr. E. W. Keeler in a letter in auother column. We do not understand from what he says that it has stood the test of experience in any large scale. It must be remembered that with these sands, as with any other low-grade material, too much handling will not do, nor will two or three operations in the treatment pay. The sands, being heavy, pack very closely in whatever vessels they are treated and cannot be massed in large quantities at ouce. Mr. Keeler does not describe the "contrivance" which he uses submerged in the tank, so it is impossible to judge much about the details of his plan.

Aid from Other Mining States.

As the miners of California, at their anuual conventiou in this city next month, intend discussing the United States mining laws, with a view to obtaining some relief from Congress, it might be well for them to invite co-operation from other mining States. At their first and second State conventions they were principally engaged in an attempt to rehabilitate hydraulic miniug in Califoruia, in which miners in other States were very little interested. Special congressional laws having been adopted to that end, attention is now to be turned to the laws affecting quartz and drift mining interests. Those relating to quartz interest miners in all sections of the country, and they should all be asked to assist.

There seems to be no reasou why the Executive Committee of the State Miners' Association should not iuvite the Governors of Nevada, Oregon, Montana, Idaho, Washington, Utah, Colorado, Dakota, Arizona and New Mexico to send delegates to this convention to aid in a work which will benefit the miners generally. The questions involved affect the Western regious almost entirely. The miuers of California should not attempt single-handed to institute reforms in laws which interest so many in other States. Unity of action is necessary to accomplish anything in this direction, and no doubt the other States would "stand in" if invited.

By confining their efforts to one or two subjects, and laying the case properly before Congress, some attention will be paid to the demands, especially if they are reasonable, as they will be. It is as well to understand, however, that it would serve little purpose to turn the convention into a "silver congress," by taking up much time with that subject. There have been numerous silver congresses, and floods of memorials and resolutions from assembled miners; but silver having finally got into politics, its complaints and demands do not seem to be paid much more attention to by Congress than those of politicians themselves. A strong free-silver resolution would be fitting and proper at this convention, the delegates all being miners, but that subject might be left to the special congresses which discuss it, and most of the time be taken up iu arranging for a revision of the general mining laws.

As is pointed out in another article in these columns, there is plenty of work before the coming California Miners' Convention. It is expected to deal mainly with proposed mining legislation and rulings of the Departments. Judicious action in these directions will make itself felt, and it is the duty of all miners to give these subjects their best considerations. The Governors of other States should send delegates, who would aid the California miners by their experience and advice, and on their return to their homes they could urge the assistance of their Representatives in Congress to the measures endorsed by the convention. There is time to invite this co-operation, provided the executive committee of the California Miners' Association approves the suggestion.

A Large Gas Engine.

The development of the gas engine for both marine aud stationary work is being rapidly carried out. Already there are numbers of them in use for hoisting, etc., at mines, but their principal use has been in marine work. Starting only a few years ago in this city to serve as substitutes for the naphtha engines on launches, larger sizes have been gradually introduced until they are now being used for business as well as pleasure on the water. The largest one yet built by the Union Gas Engine Co. was tried last week on the new schooner Moro. It is of seventy-five-horse power and propelled the schooner on her trial trip nine miles per hour. This is a very good record indeed, and will doubtless lead to the construction of other engines of this type for good sized schooners.

The gas is formed from gasoline, and is exploded in the cylinders by an electric spark. Of course the boiler is doue away with, there being no steam, so

that the whole motive power takes up very little room, which is an important factor in vessels. The Moro is quite a handsome vessel, and was built at the shipyards at Oakland. She is to ply between this city and the Albion river, on the north coast.

Rafting Lumber at Sea.

Another failure in rafting lumber on a large scale from the northwest coast is to be recorded. This one was built at Stella, Wash., but went to pieces while being towed to this port. This raft was cigar-shaped and contained 10,000 logs, or about 8,000,000 feet of lumber, worth $50,000 up there, and three or four times as much here. It was 540 feet long, 54 feet beam, 26 feet deep and 21 feet draught. The piles or logs averaged 50 feet in length and 14 inches diameter at the center, though there were some spars 100 feet long and 30 inches in diameter. The raft was built solid and secured by about sixty tons of strong chain. There was enough lumber to make cargoes for about ten vessels.

Soon after leaving Astoria the tug met a succession of gales and rough seas, and the raft began to go to pieces; when abandoned there was only about seventy-five feet of it left.

The attempt to tow these big rafts on this coast has not been a success, several having been wrecked. A number of trials have been made. The Pacific is by no means true to its name in these latitudes, for, even if there are no heavy winds on the immediate coast, off-shore gales are apt to create a heavy sea. There are no harbors to put into, and once started the raft must take what it meets in the way of weather.

The sailors on the coast are very much opposed to these attempts to raft lumber, claiming that when the rafts break up at sea, as they generally do, the thousands of floating piles are menaces to navigation. If there is exceptionally calm weather a raft may be brought down from the lumber ports, but rough weather along the coast is more frequent than calm, as experience proves. The recent heavy loss of lumber will doubtless prevent another trial in ocean rafting of lumber for some time.

The Mining Bureau Museum.

Among the the recent contributions to the museum of the California State Mining Bureau are the following:

Gold quartz rich in free gold from the Bonanza mine, Lundy, Mono Co., from J. Parrett; barite, good quality, Mineral Hill, Mono Co.; rhodocrosite, very fine specimen, from John Reed mine, Colorado.

Tin ore showing abundant crystals of cassiterite, Cotogoita, Bolivia, from J. J. Hill.

Five slabs very handsome marble from Ensenada, Lower California, from Antoine Fusillet.

Iodyrite (iodide of silver), embolite, stalactite, limonite, auriferous basalt, cerrussite, stolzite, pyromorphite, and a number of other specimens of interest from Australia.

Auriferous conglomerate specimens from five or six mines at Johannesburg, South Africa, presented by Alexander M. Womble.

Telluride ore, Good Hope mine, Colorado, from Ira A. Scott.

Native copper with gold and silver, Mountain Meadows, Plumas Co., from Wm. C. Root.

Coal, said to be the best found in Mendocino Co., from a six-foot vein known as the Thomas mine, Eden valley, also copper ore of good quality from same locality; both from Mr. W. P. Thomas.

Fluorite, Ferris canyon, Sweetwater Mts., Nevada, near California State line.

Cassiterite (crystals) from Perak and Selampore, Malay Peninsula, between Penang and Singapore, from Dr. Jno. Rabe.

Auriferous conglomerate and calcite containing cinnabar from Golden Fleece mine, Ashland, Oregon; found in the "Chico" cretaceous sandstone, and supposed to be a continuation of the auriferous gravel recently found in Siskiyou Co., Cal.

Zinc ore, Santiago canyon, Orange Co., Cal.; and a large number of specimens of gold quartz, ores, minerals, rocks, etc., of interest from various localities in California.

There has been placed on exhibition by Mr. Alexander M. Womble a remarkable specimen from South Africa—antimony ore with free gold and fourteen small diamonds!

THE Virginia *Chronicle* says: The bullion yield from the recent discovery of ore in the Con. Virginia mine is beginning to make itself felt in a number of ways. Superintendent Lyman filed a sworn statement of the bullion yield for the last quarter ending September 30th, with Sheriff and ex-officio Assessor Quirk. The statement shows that the county of Storey is entitled to a bullion tax for the past quarter of $5572.10. The gross bullion yield of the Con. Virginia for July, August and September, according to the statement, was $204,590.29. The total cost of extraction, transportation and reduction was $93,149.16. The net bullion yield was $111,441.13. The tax on the net yield at $5 a hundred comes to the figure named. Prior to the quarter just ended there was no net yield of bullion for a long period; hence there was no tax to be collected. The Con. Virginia Company has a certain time, fixed by law, in which to pay the tax for the quarter just completed. This revenue, although not large, will be a welcome addition to the slim assets of Storey county. It is to be hoped that the grand old mine that yielded it will keep coming in the same fashion for a long time.

Railroad Selections of Mineral Lands.

Miners who have only possessory title to their mining claims, and no patent, should at once look up their exact location and see that their rights are protected, or, under a recent ruling of the Interior Department, they may find they have lost their property. Even those who have, by location and regular annual assessment, held their claims for years, supposing their title good, now have their rights endangered, and, unless they take care, they will lose their claims.

A recent decision of the U. S. Supreme Court in the case of Bardon vs. the Northern Pacific Railroad Co. holds that the Secretary of the Interior may determine the character of railroad land up to the time of issuing patent to the railroad company, but that after such patent has issued, the land is without his jurisdiction and no further hearing to determine the character of the land can be had.

Pursuant to this decision the Secretary of the Interior, on the ninth day of July, issued a general circular having reference to selections by railroad companies of lands located within supposed mineral regions. By this circular it was provided that wherever a list of railroad selections covered lands located within six miles of any mineral entry, claim or location, a publication should be made for sixty days, calling upon such mineral claimant to appear and protest against the railroad selections, and in the *absence of such protest*, the land should be adjudged to be agricultural in character and the list would be approved and patents issued accordingly to the railroad company.

Herein lies the danger to those claim owners whose claims are within the regions affected by the railroad interests. Unless they notice the advertisement, and make an effective protest, their mineral ground is apt to be turned into agricultural by due process of law.

It is a well established principle of law that upon findings of fact the decisions of the Secretary of the Interior are final and will not be reviewed by the courts. Inasmuch as very few mineral claimants know either of the Borden decision or the circular instructions by the Department, they are very apt to overlook or ignore the publication of the list of railroad selections; and inasmuch as their interests are so vitally affected by the proposed action, it is highly important that the greatest publicity should be given the matter to the end that the mineral claimants appear before the local Land Office and perfect their claims. Of course it is best to get a patent and settle the legal right to the ground for all time. It is not right for the Government to be deprived of the price of the claims, and it now is seen that it does not propose to allow the matter to continue indefinitely. In other words, this is practically an effort to compel miners to perfect their title by applying for patent.

In conversation this week with Mr. A. H. Ricketts, the mining lawyer of this city, who wrote the article in the last Report of the State Mineralogist entitled "A Dissertation upon the Origin, Development and Establishment of American Mining Law," some of the above facts were elicited, and he expressed the belief that this is but one of the ways in which these imperfect (because unpatented) mineral claims are liable to be attacked in the near future, and that too much importance cannot be given to the idea that all mineral claimants should perfect their title at an early date. Furthermore, a source of danger to the mineral claimant which should not be overlooked in this connection lies in the form of the notice to be given of the railroad company's application for patent.

The instructions simply provide that the lands sought to be patented shall be designated by legal subdivisions without naming the adverse claimants therein, and such claimants may derive no information from a notice that certain lands so described embracing their mineral locations, for it is seldom that the miners know or give thought to where the township lines are. And so, resting in the fancied security of their possessory title, they give no heed to such notices nor discover the *locus* of such lines until after their mining claims are covered by an agricultural patent.

By the courtesy of Mr. Ricketts we are enabled to publish the full circular of instructions of the Secretary of the Interior. It is as follows:

DEPARTMENT OF THE INTERIOR,
WASHINGTON, July 9, 1894.

The Commissioner of the General Land Office.—SIR: In the matter of the selection by railroad companies of lands in satisfaction of their grants, the following rules and regulations will be observed in determining whether the lands selected are mineral or non-mineral lands:

1. When the lands have been returned by the Surveyor-General as mineral, a hearing may be had to determine the character of the land.

2. Where the lands selected by the company are within a mineral belt or proximate to any mining claim, the railway company will be required to file with the local land office an affidavit by the land agent of the company, which affidavit shall be attached to said list when returned, setting forth, in substance, that he has caused the lands mentioned to be carefully examined by the agents and employes of the company as to their mineral or agricultural character, and that, to the best of his knowledge and belief, none of the lands returned in said list are mineral lands.

Upon receipt of said list, you will cause it to be examined and a clear list to be prepared of all lands embraced therein that are not within a radius of six miles from any mineral entry, claim or location, which list shall be transmitted to the department for its approval. If any of the lands embraced on said list of selections are found upon examination to be within a radius of six miles from any entry, claim or location, you will cause a supplemental list of such lands to be prepared and return the same to the Register and Receiver in the district in which they are situated, and notify the railroad company that they have been so returned. The Register and Receiver will at once cause notice to be published in such newspapers as shall be designated by the Commissioner of the General Land Office, containing a statement that the railroad company has applied for a patent for the lands, designating the same by townships, and has filed lists of the same in the local land office; that said lists are open to the public for inspection, and that the local land offices will receive protests or contests within the next sixty days for any of said tracts or subdivisions of land claimed to be more valuable for mineral than for agricultural purposes.

At the expiration of said sixty days the Register and Receiver will return to the Commissioner of the General Land Office said supplemental list, noting therein any protests or contests or suggestions as to the mineral character of any of such lands, together with any information that may have been received as to the mineral character of any of the lands mentioned in said list. After the same shall have been returned by the Register and Receiver, you will first eliminate from said supplemental list all the lands that have been protested or contested or claimed to be more valuable for mineral than for agricultural purposes concerning which any suggestion has been made as to the mineral character. The remaining lands you will certify to this department for approval and patent as agricultural.

In regard to lands protested or contested, or claimed to be mineral, or concerning which any suggestion has been made, or report by the Register and Receiver as to their mineral character, you will order a hearing to be had by the local land officers in each case, after giving due notice to the persons furnishing such information and to the railroad company under the said rules and regulations of this department concerning hearings in cases where the land has been returned as mineral land.

The railroad company shall pay to the Register and Receiver the cost of advertising said lands in the manner set forth.

You are further instructed that all lists which have been heretofore prepared in accordance with any rule, regulation or instruction of the Secretary of the Interior, where such rules have been complied with (such as furnishing affidavits showing the non-mineral character of the lands in accordance with the instructions of the Interior Department) and such mineral affidavits furnished for each subdivision of forty acres shall be excepted from the terms of the foregoing regulations; also, where lists of selections are now pending of lands returned by the Surveyor-General as mineral, where hearings have been in accordance with Rules 110 and 111 of December 10, 1891, and the local officers have determined that said lands are non-mineral in character, and such determination has been approved by the General Land Office, such lands shall be submitted to the department for approval without further investigating, although they may be within six miles of any mineral claim or location, unless, since said hearing, mineral claims or locations have been made of any tract embraced in said list, in which event you will eliminate said tract from said list and hold the same for future investigation. Very respectfully,

HOKE SMITH, Secretary.

Miners should give immediate attention to the conditions herein described and be prepared to take the necessary steps to prevent losing their claims by neglect of the proper precautions. They should at once find the exact location of their claims with reference to legal subdivisions, and look out for the advertisements of the railroad company when they apply for their patents. But the better way is, of course, to perfect title by obtaining a title by patent from the Government as soon as possible.

Personal.

WHILE Mr. Ross E. Browne was away on his recent trip he examined some large hydraulic mining properties in British Columbia.

F. B. HOBBS of Boston, Mass., has arrived in Downieville, Sierra county, to set up and run the electric plant of the Gold Bluff mine.

MR. THOS. H. LEGGETT, president and general manager of the Standard Cons. mine of Bodie, is in the city on a brief business trip.

E. COMERGE, of Paris, and G. Chartier, of Denver, are at Weaverville looking after the interests of the French Company, which has lately acquired large gravel mining interests in that region.

PROF. S. F. EMMONS, U. S. Geologist, and his assistant, J. E. Spurr, accompanied by J. W. Neill of the Viking Company, are in Park City, Utah. The professor will make a geological survey of the district.

MESSRS. W. H. H. BENYAURD AND W. H. HEUER, U. S. Debris Commissioners, accompanied by John F. Kidder, State Debris Commissioner, have been examining some hydraulic mining properties in Nevada, Sierra and Yuba counties.

E. HUHN, superintendent of the Oak Tree mine at Mayhert, and F. Howard, one of the principal owners in the mine, came down from Mayhert to Nevada City, says the *Herald*, and went to San Francisco, whence Mr. Howard will leave for his home at Kansas City, Mo.

British Iron Trade.

The following article is from the London *Times:*

For a number of years past very serious apprehensions have been aroused by the circumstances of the iron industry of the United Kingdom, more especially in view of the progress made by competitive countries. In commercial circles it is now quite a common thing to hear our iron industry spoken of as a manufacture that has ceased to make progress and is doomed to gradual decay. An examination of the returns of our exports for several years past appears to confirm this view, and it is further supported by the returns of the production of pig iron, Bessemer steel and wrought iron during recent years. The statistics of the production of pig iron for the first half of 1894, which have this week been issued by the British Iron Trade Association, show that although the output for that period was more than for the corresponding half of 1893, it is still much behind the output of a few years ago. On the other hand, it is a subject for both surprise and congratulation that we have again recovered, at any rate for a time, the supremacy in the production of iron which in 1890 we resigned in favor of the United States, and stand once more at the head of the iron-producing nations of the world in the matter of output. We append the statistics of the output for each of the years 1883 and 1893:

	1883. Tons.	1893. Tons.
Production of pig iron	8,490,000	6,830,000
Production of manufactured iron	2,730,000	1,364,000
Production of Bessemer steel	1,553,000	1,493,000
Production of open-hearth steel	455,000	1,456,000
Totals	13,228,000	11,143,000

These figures show that, in spite of the increase of more than a million tons of open-hearth steel in the interval, the total quantity of the material produced fell off to the extent of considerably over two millions of tons, the decrease being more especially noticeable in pig iron and manufactured or wrought iron. The decline in the latter branch of the trade is not, however, so much a matter for anxiety, as the wrought-iron industry has been a decaying one for years, and its decay has been almost as marked in some other countries, and more particularly in the United States, as in our own. It is the enormous absolute decline, as compared with the previous corresponding period, that specially arrests attention. Between 1873 and 1883 we increased the output of our iron and steel works by 3,268,000 tons, or 33 per cent, while in the period 1883–1893 we fell off 2,085,000 tons, or 16 per cent.

If these facts stood alone they would be sufficiently alarming, but unfortunately they are allied to other facts that are perhaps still more likely to excite apprehension. In 1883 our total exports of iron and steel amounted to 4,043,000 tons, valued at £28,590,000, whereas in the year 1893 our corresponding exports only reached 2,911,000 tons of the declared aggregate value of £20,609,000. It is a somewhat remarkable coincidence that the decline of 1,132,000 tons in the volume of our exports exactly corresponds with the total quantity of the exports of iron and steel from Germany in the year 1892. This, however, does not mean that the German exports have grown to this extent, or even at all, during the period in question. On the contrary, it appears that the total volume of German exports of iron and steel in 1883 were, like those of our own country, larger than in 1892; but the Germans, in the interval, have greatly improved their position by exporting less pig and more finished iron and steel. The same remark applies to Belgium, our next most important competitor, which exported 434,000 tons of iron and steel in 1883, as against only 406,000 tons in 1893. But while other countries have also diminished their exports, as between the two periods, it will be observed that the falling off in the exports of British iron and steel is much larger than in the other cases referred to. It is manifest, in short, that the world has been consuming a greatly reduced volume of iron and steel, and probably it was largely inevitable that Great Britain, as the chief exporting country, should be the greatest sufferer thereby.

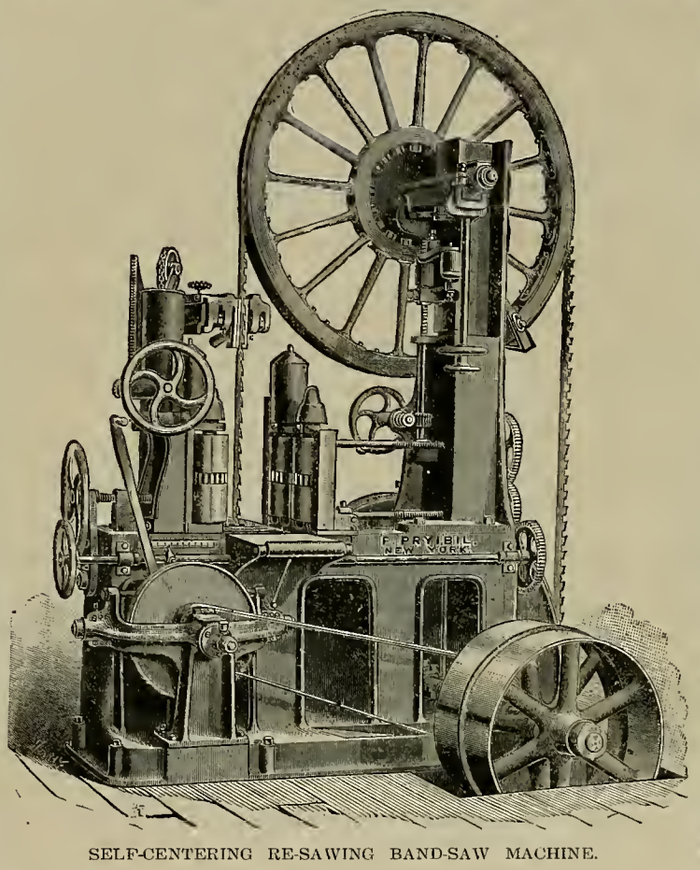
This circumstance, however, does not adequately or satisfactorily account for two other facts of fundamental importance—the first that the production of British iron and steel has largely fallen off relative to that of other countries, and the next that the imports of iron and steel into Great Britain have largely increased relatively to the exports of the same class of goods from that country. In considering the facts of the situation from this point of view, the United States may be left out of account, as being a law unto themselves, and as being, up to the present at least, practically a non-competitive country in this branch of manufacture. What English manufacturers have had more especially to complain of in late years is the success of German and Belgian manufacturers in our home and colonial markets. It will probably be among the things not generally known that more German iron is imported into Great Britain than into any other country. The iron was probably largely in transit for Italy and other countries, while in our own country it had come to stay. During the year 1893 we imported into Great Britain 116,000 tons of German iron and steel, while into the British colonies we imported nearly 100,000 tons more. The whole of the American continent, excepting Canada, did not take more than one-half of the quantity of German iron and steel that the British Empire did that year. Our total imports of iron ores and finished iron and steel of late years have ranged from £6,000,000 to £8,226,000 in annual value. This is comparatively a recent movement, for in 1870 the annual value of such imports, which almost wholly took the form of Swedish bar iron for the crucible steel industry, did not exceed $700,000. England still leads the world in the production of cheap pig iron, which is the basis of the whole superstructure of iron and steel exports, but we have of late years been falling behind in the economical production of the finished forms of the material, where cheap labor becomes the principal factor to be reckoned with. Continental producers have, in addition to cheaper labor, the further advantage of cheaper railway freights, cheaper shipping charges, and cheaper methods of placing their orders. Finally, it is an open secret that in German competition, at all events, contracts are often made at less than the actual cost of production. In other words the Germans, being protected in their own markets by a virtually prohibitory tariff, and being thus enabled to depend upon remunerative prices at home, find that it serves their purpose to keep their works as far as possible fully employed and take what prices they can get outside for the balance not consumed at home. In this way the Germans have for many years past had two scales of prices—one for home markets, which was relatively high, and another for outside markets, which was relatively low.

Apart, however, from these special conditions affecting German competition, there can be no doubt that the iron trade of that country has of late years greatly improved its competitive position in reference to the iron and steel industries generally, and that it now menaces the prospects and prosperity of the English iron trade to a larger extent than has ever happened in the past. Until a comparatively recent date the German iron and steel manufacturers were behind those of England and the United States in the economy of their methods and appliances, so that their cheaper labor did not count for so much as it otherwise would have done. But Germany has now come almost abreast of the English conditions of work, and in some matters is probably ahead. A single proof of this advance speaks volumes of what has happened all along the line. In 1881 the average output of pig iron per furnace in Germany was only 11,609 tons, but in 1892 the average had risen to 21,000 tons. Again, in 1881, the average make of pig iron per workman employed at the blast furnaces of Germany was 136 tons, whereas in 1892 it was not less than 203 tons. This means, in short, that the Germans have within the last twelve years obtained nearly 100 per cent more from a given plant and about 50 per cent more from a given number of workmen, and the result has, of course, been to enable them to produce iron more cheaply than they ever did before. Another advantage accorded to German manufacturers, which is generally withheld from their English rivals, is a considerably lower range of railway rates for export. The German system is devised to develop the export trade and to restrict the imports, while the English railways give no special facilities for exports, and often make an effort to stimulate imports by specially low charges.

The attitude and action of labor has of late years placed English manufacturers at a very serious disadvantage. This has been especially the case during the last three years, chiefly owing to the great coal strikes in Durham, the Midlands and Scotland.

Self-Centering Re-Sawing Band-Saw Machine.

The machine illustrated on this page (from the foundry of E. Pryibil, N. Y.) will use saws as thin as 24 gauge and up to 6 inches wide. It will saw 16,000 to 20,000 feet per day, making a kerf of only 1-20 of an inch, or less, where most resaws make 3-32 to ⅛, or more. The feeding is effected by four strongly geared live rolls, while two smaller idle rolls guide the last end of the stock up to the finish of the cut. A friction device, controlled by a single lever, enables the feed to be instantly stopped or started, and to be run at any speed desired without changing belts. With machines employing step pulleys or gears for changing the feed, one speed may be just a little too much and the next one not near enough, resulting in decreased output. The saw runs between hardened steel plates filled with dog-wood plugs, with the end grain in contact with the saw, and each plate can be accurately adjusted by a single screw. The back of the saw has a bearing one and a half inches long on the beveled edge of a conical roller of hardened steel. What little wear does occur takes place across the full width of the beveled surface, and therefore does not form grooves, as would be the case with a plain roller. The upper guide is counterbalanced, and is adjustable vertically by a hand-wheel. This hand-wheel, the lever for controlling the feed, the hand-wheels for setting the feed rolls, and the scale showing to what thickness they are set, are all accessible from the sawyer's working position. The upper wheel has a rim of bent ash with steel spokes, and the lower one is a heavy iron casting. The lower wheel being thus much the heavier, acts as a fly wheel to prevent sudden and violent fluctuations of speed, as in starting and stopping, and thus prevents the overrunning of the upper wheel, which, being lighter, is capable of following the motion of the lower one without causing the saw to slip or to become slack on the working side. The rims of both wheels overhang the ends of the bearings which are self-oiling. The overhanging feature effects the same result that some makers attain by the use of a clumsy and complicated arrangement of outside hearings. The upper shaft can be angled while in motion. An adjustable spring maintains a proper tension on the saw and renders it much more secure against breakage than the weights commonly used for this purpose, as the inertia of weights prevents them from yielding quickly enough when a chip gets between the saw and the wheel, the result being a broken saw. To provide doubly against such an accident, a wooden block is fitted in the throat between saw and wheel, so as to catch all chips and sawdust and discharge them beyond the rim. The lower wheel is kept free from accumulations of sawdust by a scraper, and the upper one by a brush. The body is a box-shaped casting, in one piece, very strong and rigid, and it can be placed on any good floor without a special foundation. The loose pulley is self-oiling, one inch smaller in diameter than the tight pulley, to slacken the belt when the machine is stopped, and it is provided with a step at the inner edge to cause the belt to shift easily. Diameter of wheels, 60 inches; thickness taken between feed rolls, 21 inches, 12 inches on one side and 9 inches on the other. Height of stock that can be sawed, 30 inches; height from base to top of upper wheel, 10 feet 6 inches; width, 10 feet; depth, 7 feet; speed, 450 to 525 turns per minute, according to kind and width of lumber. Weight of machine complete, about 7000 pounds; length of saw blade, 31 feet; driving pulley, 26 inches.



SELF-CENTERING RE-SAWING BAND-SAW MACHINE.

Electric Hoists and Pumps for Mines.

(*Continued from page 257.*)

The motor is bolted directly to the bed of the hoist and is geared to the drum through a powerful friction clutch. The hoisting is controlled by a lever, actuating the friction clutch, while the motor runs continuously. This has been found to be much better than controlling by a rheostat in the motor circuit, as the liability of a breakdown due to the rheostat getting out of order by short circuits, wearing out of contacts, etc., is done away with. It is also much less strain upon the motor. The hoists are made with either single or double drums and are well adapted for mining, dock or warehouse work.

For ventilating purposes also the C. & C. motor has obtained for itself a great deal of prominence. The motor is supported on wrought iron arms bolted directly to the fan frame. Its circular form and great compactness prevents it from cutting off the area of draft, except at the center, where there is very little action of the fan blade. These motors are wound for various speeds of regulation, being effected by means of field commutation by the use of a suitable switch. They may be set either vertically or horizontally. The merits of this motor, in connection with ventilating machinery, are well attested by the fact of their being used in many instances upon government cruisers.

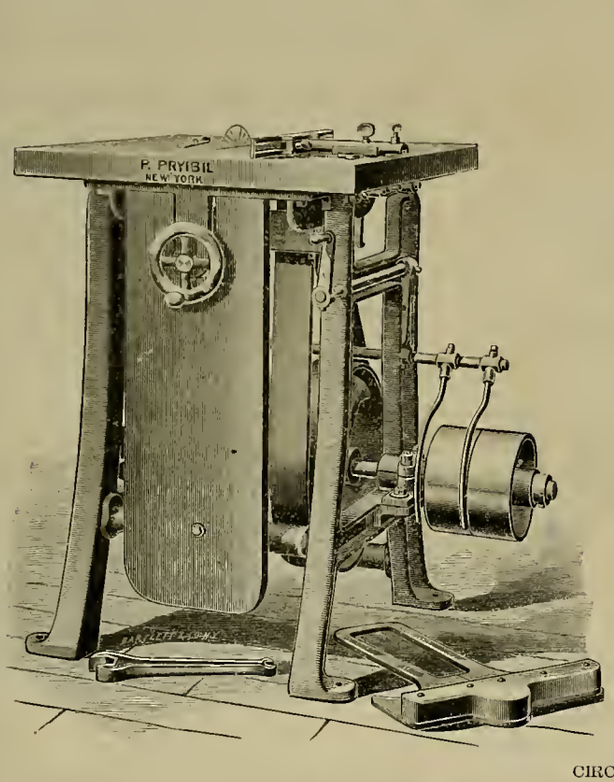
The C. & C. Electric Co. are represented on this coast by the California Electrical Works, 35 Market street.

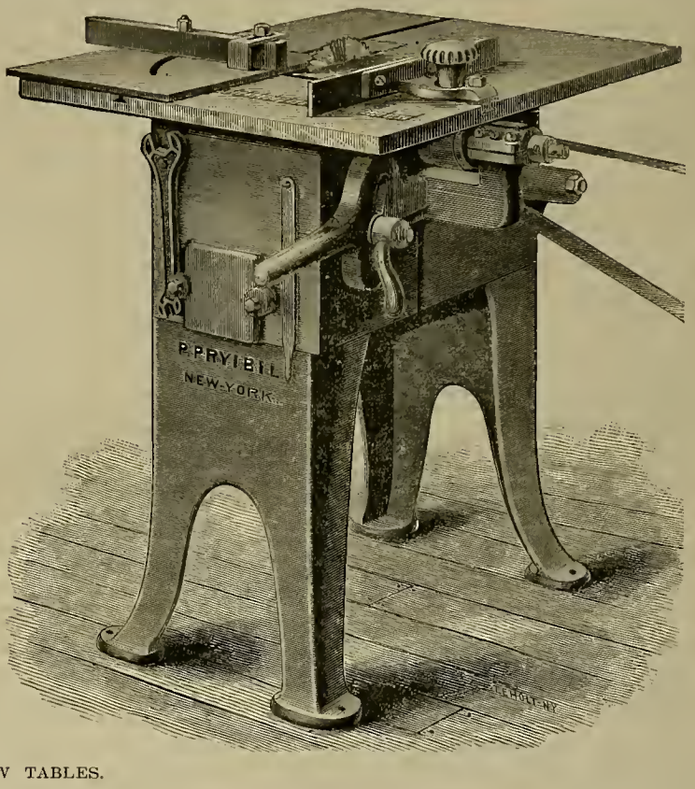
Circular Saw Tables.

The cuts on this page illustrate circular saw tables from the Pryibil foundries, New York. That at the right (No. 4), although suitable for wood, is designed more particularly for metal, ivory, horn, tortoise-shell, etc. The saw arbor is carried by a swinging frame, which is counterbalanced and held securely at any desired height by a clamp screw.

The table is of iron and is set upon an iron box, which catches the sawdust and holds water for the saw to run in, and which is provided at the lower part with a hand-hole for emptying and cleaning. The table is provided with an adjustable gauge and with a carriage with miter-fence. A removable throat-piece gives access to the arbor and provides for the use of a wabble saw or groover. The arbor pulley is three inches diameter and three inches face, and should make about 3500 turns per minute. The countershaft generally has an eighteen-inch pulley for a three-inch belt, and eight-inch self-oiling, tight and loose, for a three-inch belt. It should then make about 600 turns per minute. Weight, without countershaft, about 395 pounds. Size of table, two feet six inches by two feet.

The cut at the left illustrates a very accurate machine, designed for fine, accurate work, such as piano actions, and for electrotype and stereotype work. The arbor frame is stationary and the table of iron, and is adjustable, being supported at the back by pivot screws, and at the front by two cams operated by a hand-wheel and screw at the front of the machine. Thus a true adjustment is always obtained and the table is well supported. Access to the saw arbor is obtained by lifting the table, but a reversible throat-piece provides for the use of stiffening plates on the saw, and for the use of a wabble saw or groover. An adjustable rip-gauge is furnished with each machine, and a carriage, of iron, when ordered. The countershaft is mounted on the frame of the machine or made separate, with floor-standards, as ordered. The arbor pulley is two and one-half inches diameter, three and one-half inches face, and should make about 4660 turns per minute. The countershaft generally has a sixteen-inch pulley for a three-inch belt, and eight-inch self-oiling tight and loose, for a three-inch belt. It should then make about 730 turns per minute. Weight, with countershaft, about 400 pounds. Size of table, two feet six inches by two feet.





CIRCULAR SAW TABLES.

Loss in Scorification Assays.

The loss of gold and silver in the scorification assay is a considerable, though rather an indefinite, quantity. Messrs. W. P. Mason and J. W. Bowman have been making some experiments to determine the amount of this loss. From a number of assays they found that with silver the loss by the process was 2.54 per cent, of which 1.99 per cent was in cupellation and 0.55 per cent in scorification, says the *Engineering Magazine*. With gold the loss in the entire process is 0.87 per cent, of which 0.296 per cent was in cupellation and 0.574 per cent in scorification. These results show larger losses than is commonly supposed, and perhaps larger than is usual. But they serve to explain in part some of the exceptionally high records made in smelting, where the comparisons are based on the scorification assay. It remains now for a new series of experiments to be undertaken to determine losses in the crucible assay for gold and silver. Some figures are quoted in the books, but they are not regarded as altogether reliable, and there is always the personal equation of the assayer to be taken into the account. In his new book on assaying, Mr. H. V. F. Furman advocates the determination of silver in two or more portions of the ore by scorification, and the gold in two or more portions by crucible assay. This is the Colorado practice. Most ores yield higher silver returns by scorification and higher and more uniform gold results by crucible assay. The reason stated by Mr. Furman why the crucible method gives better results on gold, is that it allows larger quantities to be taken for assay, and hence a larger gold button for weighing. Both methods can, of course, be made more accurate by running a number of assays and combining the buttons in parting. The claim for the remarkable delicacy of the fire assay for assay of gold and silver still holds good, if care is taken and all sources of error are understood and proper allowance made. In ordinary work the error should not be more than half an ounce silver (and much less gold) per ton; while in delicate scientific experiments, using specially prepared litharge and micrometer measurement of buttons instead of weighing, Mr. J. S. Curtis has determined (and proved) quantities of silver down to five and three cents a ton of ore.

Steamboating for Gold.

Extravagant stories are told about the wealth of gold sprinkled throughout the Snake River country in Idaho. As a general thing, the gold is very fine, the particles being of so light weight as to be elusive. Save when worked on a large scale, it is difficult to make good wages in recovering the gold. Numerous bars along the river would prove profitable could water be commanded for sluicing or hydraulic purposes. An adequate supply is hard to obtain on account of the slight and gradual fall of the stream and the level character of the outlying lands. To overcome this lack of water, as well as to insure sufficient dumping ground, a big floating gold-saving dredge has been constructed and is now at work on the Idaho bank of the Snake river, about ten miles above Payette.

It is a stern wheel flatboat propelled by steam. Substantially constructed, sixty-five feet long and twenty-two feet wide, it is equipped with a thirty-five horse-power marine engine and boiler and adapted in every way for navigating Idaho's great waterway. With a slight alteration, it could be transformed into a steam dredge and used to scoop up sand and gravel from the bottom of the stream. That has never been attempted. As in the past, operations are now confined to working bars out of the bed or channel of the river. The method pursued is to anchor alongside one of these gravel deposits and by the use of scrapers bring the material to be handled within the reach of the gold-washing machinery with which the craft is rigged. The gravel is scooped up by buckets attached to an endless chain.

There are forty-eight of these receptacles on a belt sixty feet in length, and each has a capacity of about twenty pounds of dirt, which is delivered into a hopper. This is also an agitator, and the process employed may be described as a steam rocker, with the exception that it has an end motion instead of one sidewise. The gold is caught on copper plates with quicksilver. The tailings are carried off in sluice-boxes by the force of a stream of water of 150 mineral inches, supplied by a China pump, run by the engine which drives all the other machinery. The gravel is worked so thoroughly that no gold escapes in the tailings that are dumped into the river. An average of 100 tons of gravel is daily handled, and for this work three men are employed—an engineer, one to work the scraper and another who shovels the dirt into a pile so that the buckets can scoop up a full load.

The bar now being worked covers an area of ten to fifteen acres. The gold is on top or close to the surface and will not pay to handle to a greater depth than one foot to eighteen inches. This shows a value of one and one-half to three cents a pan. A clean-up is made every night, and the average of the runs for the first three days was very satisfactory to Thornton Williams, the owner of the craft. He says he expects to take out upward of $100 a day as long as he works, which will be until cold weather sets in. When he has gone over the bar which now engages his attention, he will tackle another.—Helena Independent.

Concentrates.

BAKER CITY, OR., thinks it ought to have a mining bureau.

TWO HUNDRED MEN are digging out gold from the sands of the La Platas, Col., at the rate of $3 to $7 a day per man.

MESSRS. BROWNLEY AND SNOW took out a $4000 pocket from their mine near Tuttletown, Tuolumne county, last week.

IT is reported that Smith Brooks of New River, Trinity Co., has struck a good ledge in the Mary Blaine mine of that place.

THE *New Era* says the altitude of Kennedy is 5525 feet, which is 1000 feet lower than Austin and about 900 feet higher than Winnemucca.

THE De Lamar Mining Company of Lincoln county, Nev., is building a 200-ton ore bin at the Monitor mine, and expects to have their mill running before snow flies.

KENNEDY, NEV., is overrun with men in search of employment. Work at the present time is hard to get, as all positions in both mills and mines are filled.

DURING the month of September there were filed with the clerk and recorder of Jefferson county, Montana, the location notices of 220 quartz claims and 19 placer claims.

SAGEBRUSH is utilized at the Imperial mill, Kennedy, Nev., for fuel, and it is said to be cheaper than any other fuel, although pine and cedar are delivered at $5.50 a cord.

THE Hecla Company of Glendale has declared a dividend of one per cent, aggregating $15,000, payable the 25th inst. The Hecla is the chief lead-producing mine in Montana.

A RECENT week's gold receipts at the Helena assay office broke the record for all previous weeks in the history of the office, the amount being a little over $120,000, representing 130 deposits.

WE understand that the old Wisconsin claim, near Forest City, Sierra Co., is to be reopened. Henry Grant is one of the principal owners, and the work will be done under his direction.

MR. G. C. TUNSTALL, gold commissioner, who has returned from Similkameen, reports that mining prospects in that part of British Columbia are good, and he has no doubt but that the output of precious metal will be large.

BAYLEY'S REWARD, the pioneer claim of the Coolgardie, West Australia, gold field, yielded during the twelve months ending April 5th £234,000 in gold. Since that date the present company has added approximately £60,000 more to the output.

THE Baker City *Democrat* is informed that an important mining deal has just been consummated in Grant county, Oregon, the Sloan & Haskell placers on Elk creek passing into the hands of Connecticut capitalists. It is said that the purchase price was $40,000.

ANOTHER mining deal for the vicinity of the Seven Devils is to be recorded. The Placer Basin group, consisting of four quartz claims owned by E. M. Barton, J. A. Dummick and Harry Siskrow, has just been sold to Captain Miles Standish of Salt Lake for $15,000.

IT appears now to be the general opinion that if the bottom of the Comstock lode should drop out from end to end, there would be some certainty of a boom in the market, with possible bonanza prices. Ore developments do not seem to count any more.—Virginia Enterprise.

ADVICES from Chile say that in Coquimbo the gold fever continues developing. Andacallo is not the only place at which gold has been struck, but at Cruz de Caras also, where the range is in a virgin state. In many parts of the province of Anoud gold has also been struck.

THE cyanide machinery for the Black Hills Gold Extraction Company is now all in and is rapidly being put in place. Just as soon as this is done the plant will start up for a long run. This will be good news, for several mines have been holding ore for this plant to reduce and will send lots of precious ore from the hills near Deadwood, Dakota.

THE town of Plymouth, Amador county, is apparently beginning to enter upon a regular boom. There are several new mines being worked, and quite a lot of prospecting going on. Old houses in the town, which have been unoccupied for several years, are being repaired and fixed up for reoccupancy. The hotels are patronized to their full capacity.

THE miners in all the dry diggings of small creeks and high mountain gulches are preparing for the winter storms by drifting and getting out pay gravel for washing when an abundance of water is attainable. If we should have as good a season as last winter a great amount of gold will be realized from the dry diggings only workable in winter.—Yreka Journal.

THE Salt Lake *Tribune* says: The plans for the enlargement of the Marion mill, in Camp Floyd district, are now well under way, and before winter sets in the output of this property will be doubled. The capacity of the mill is to be increased from 50 to 100 tons daily, and the mine is in such a state of development that any amount of ore can be taken out.

THE famous Pichacho placer mines near Yuma, located about a year ago by a non-resident English capitalist, and held by aliens, have all been relocated by parties backed by Montana mining capitalists, on the grounds that the mines are held and owned by aliens contrary to United States mining laws. The English company will not be allowed to work the mines until the case is decided by the courts.

THISTLE SHAFT is reported to be doing better than ever before. They have just struck into the main channel, and the gravel is said to be rich. The company employs seventy men, not including those on contract work. Five new dwellings are going up at the mine. This mine has fully demonstrated the great wealth which lies bidden in the ancient channel in the ridge extending from Gibsonville down to La Porte.

A BIG mining deal is reported to be nearing consummation. Agents of an English syndicate are now in the Coeur d'Alenes concluding negotiations for the purchase of four of the most valuable properties—the Poorman, Tiger, Gem and Frisco mines. The plan is to operate them under one management, thus not only reducing the expenses of working the properties, but placing the owners in a position to better dictate freight rates, smelter charges, etc.

THOS. S. NOWELL, of the Nowell Gold Mining Co., is well pleased over the mining outlook of southeastern Alaska. He asserts that the outlook has never been better within his knowledge of the country, and in proof of the sincerity of his statements he says he intends to add twenty stamps more to the mill at Berners bay, and that before next fall he intends to have forty more running in the Basin on ore from the Ground Hog; nor does the work stop here, for the next spring will undoubtedly see the erection of a large stamp mill on the group of claims near the Comet.

THE London *Mining Journal* says: The Rand Central Ore Reduction Company has developed a new cyanide process, known as the Siemens-Halske. In the MacArthur-Forrest process, the gold, after having been extracted from the tailings, is precipitated by means of zinc shavings; while under the new method the gold is deposited by electrolysis on two thin lead sheets. The process is being used at the Worcester property, where 3000 tons a month are being treated. The Reduction Company is also testing an aluminum process.

THE machinery for saving the gold from black sand was shipped from St. Paul, Minn., and is expected to arrive in Portland to-day. It is the intention to ship it on the Alice Blanchard, on her arrival in Portland, direct to the Coquille river, and it will not be long before several of the new machines will be in operation in the vicinity of Randolph. It is to be hoped that the originators of this new process will meet with success, as it will be a great benefit to this county to see all the black sand mines running in full blast once more.—Marshfield Sun.

THE new air compressor ordered by the Centennial-Eureka Mining Company from Fraser & Chalmers, Chicago, is undoubtedly the largest machine of its kind ever used to drive the power drills at any Utah mine. The compressor is a Rieder duplex, with 18x30-inch air cylinders, operated by a twin compound Corliss engine having 18x30 and 28x30-inch cylinders. Its weight is 120,000 pounds, and an exact duplicate of it is in use at the Milwaukee mine at Gem, Idaho. When the Centennial-Eureka gets its new compressor in place the property will be equipped with power as no other mine in Utah is and will enable the company to advantageously open up new ground.

THE plans for the new Bullion-Beck mill provide for one of the most complete mills in Utah, the total cost of which will be $50,000. The process will involve the purchasing of the following items of machinery: Two 80-horse power boilers, one 10x20 gyrating crusher, one Dodge crusher, three sets 16x36 Cornish rolls, two elevators, ten sizing screens, to be arranged in two trains, six double three-compartment jigs, two pulverizing mills, ten concentrating vanner tables. The company owns already an engine and one Dodge crusher. When the mill is finally got into working order the company contemplate putting in an amalgamating plant. The plans for it are already drawn.

A HUGE dredging plant is being built at the B. C. Iron Works, Vancouver, for the Fraser River Mining & Dredging Company. The plant consists of a screw 130x33 with a "clam shell" dredger, having a lifting power of eight tons at a distance of forty feet from its center, which will deliver sand and bowlders alike (and gold, too, it is hoped) into the sluice-boxes, to which water is supplied by two eight-inch centrifugal pumps. A new arrangement is the "water guard" or screen, shaped like an enormous snow plow, which being placed ahead of the dredger divides the current and permits work to be carried on in comparatively calm water. Power is supplied by no less than five separate engines, aggregating forty-horse power, while two others, with fifteen-inch cylinders and six-foot stroke, drive the stern wheel. Steam is supplied from a twenty-four-horse power boiler. The working of the new dredge will be anxiously watched.

The Lemhi Placer.

The figures of the season's washing of the Lemhi company are made known. A circular has been issued to the stockholders, containing a statement by President J. J. Hagerman and the report of Aug. J. Bowie, the consulting engineer, from which the following extracts are taken.

"The work of the last two years has proven beyond peradventure that the water supply of the company is wholly inadequate for hydraulic mining.

"A reconnaissance of the Lemhi was made, and finally, after several surveys, a line has been located and staked from Hayden creek to Kirtley creek, where your claims are situated. This is the highest available line for the introduction of water for hydraulic purposes on your mines.

"This source of supply will give us 3000 to 5000 inches of water during the entire season, say nine months, unless impeded by severe cold.

"The work which has so far been carried on at Kirtley creek under the most adverse circumstances, demonstrated the fact that with 120,000 inches of water we have obtained some $26,000, yielding an average of twenty-two cents per inch of water used. The results so far obtained I considered most satisfactory. It is demonstrated that, even under these most disadvantageous circumstances, we have been able to have a return of twenty-two cents per inch of water used, which means a daily output of $600, with 3000 inches of water.

"An increase of one cent per yard on the average yield of the gravel during the last two seasons' washing, would give us a yield of $27,000 per month, with 3000 inches of water, which on a nine months' run would be equivalent to $243,000, placing the value of the yard at only six cents.

"Comparing these figures with those obtained at other hydraulic properties in the same stage of development, the results are double those of any large hydraulic mine upon which millions of dollars have been expended.

"We have reached a point where the water must now be brought to supply this property to make it a paying proposition, for without it you cannot expect to have an adequate return on your investment. In view of the comparatively small cost of the entire enterprise complete, and in the light of all developments, which have been a crucial test, I unhesitatingly advise the construction of your ditch as rapidly as work can be economically prosecuted."

The stockholders are asked to pay a voluntary assessment of thirty cents per share, which will amount to $150,000; to pay off the indebtedness of the company, $100,000.

The figures of the estimated cost of the proposed new ditch from Hayden creek to Kirtley creek are not given, but it is probably about $200,000, and a move is on foot to increase the capital stock from $500,000 to $1,000,000, which it is presumed is intended to pay for it.

Bitter Root Gold.

There is considerable excitement in Spokane over the finding of rich placers in Idaho, on French creek, fifteen miles from Pierce City and about twenty miles from where Colgate's body was found, says a Spokane correspondent of the Missoula *Democrat*. Several Spokane men explored the wilds of the Bitter Root mountains and with good success. Here they have uncovered rich diggings and are putting in hydraulic works and getting in shape for a permanent camp. From tests made they expect to clean up from $15 to $20 a day for each man's work. Cabins are being built and enough supplies laid in to carry them through the hardest kind of a winter. One of the party, M. C. Murtagh, is now at the Gillette hotel arranging for the last shipment of supplies.

We are satisfied that no prospector ever visited that country before, said Mr. Murtagh to a *Chronicle* reporter. It is only about fifteen miles from Pierce City, but you must remember that about seven and one-half miles are on edge. We have made a trail now, but the first trip was an experience. The rocks and hills are piled up just like ocean waves. We forced our way through the thickest kind of underbrush, climbed over boulders and down bluffs and scrambled over fallen trees piled up twenty feet in height. But we got through finally.

It is a magnificent timber country. The forest is so dense that it is always damp, and even when the underbrush is cut and piled up it will not burn. There are places where the pine needles are matted two and three feet deep upon the ground. On our land alone, it is safe to say, there are at least a dozen huge red cedar trees that are from nine to thirteen feet in diameter, and so high that it hurts one to look up to the top.

Besides the placer ground we have located ledges of free-milling gold quartz, samples of which I intend to have tested before my return. In short, the inducements that country offers to mining men are such that it seems strange it was not thoroughly prospected several years ago.

We had some visitors this summer. A party of United States soldiers came up the creek and stopped at our camp, made many inquiries, took notes freely and then faced about and went home. They did not state the object of their trip, but it is supposed to have been for the purpose of locating a new road over the range.

An Ore Dredger.

Up on the Mesaba range a new invention for handling ore, known as the Bates ore dredger, is receiving quite a good deal of attention from mining men. The construction is very simple, although the invention is by some considered a great achievement in the science of mining. No cars, tracks or equipment are required in the mine. First, a tower 72 to 100 feet, is erected on either side of the ore body or other material to be removed. The set towers are on platforms mounted on railway tracks, and the hoisting engine and boiler are placed on the main platform. A two and one-half inch wire cable is stretched between the two towers, and on this cable is conveyed the carriage from which is suspended the dipper. This dipper is a huge affair, weighing over three tons, with four leaves, which open and close at the will of the operator. The dipper, when opened, has a spread of nine feet, and gathers two and one half yards of dirt to a load. It is lowered slowly to the ore body and not dropped from a height, as was at first necessary. The action is such that as the leaves are closing the dipper digs downward until fully closed, and fills itself without the least trouble. The action of the dipper pulls down instead of upwards until loaded. The dipper is then hoisted and carried to the pocket over the car and emptied. When the cut is sufficiently wide both hoisting and carrying can be done at the same time, thus increasing the speed. The best time in loading a twenty-ton car was fifteen minutes, but when everything is in good working order it is expected to load five cars an hour.

Practical mining men have expressed the opinion that this invention solves the problem that will confront Mesaba range miners when the ore is so deep down that loading with steam shovel is no longer possible. The dipper will go down after the ore at any depth.—American Manufacturer.

Placer Gold.

To the Editor: —"Surely there is a vein for the silver and a place for the gold where they fine it." What was true in Job's time is equally so now; for, while silver is found in veins, gold is both where they find and "fine" it. Much has been written on the origin of placer gold, and the ground still remains rich in unlocated "float." The article of Mr. R. L. Dunn is timely and calculated to bring out the practical experience of others. With this object in view, I beg to differ from Mr. Dunn in this—that gold-bearing ledges are not as rich in coarse gold in depth as on or near the surface, and in consequence placers equally as rich as those of the ancient rivers could not be made from the same ledges at this time. It is a common experience with all mining operators that the veins do not go down, and it is a still more common experience that the ore bodies are simply "blossoms" that do not lead to fruit. These surface veins vary in size and extent with the locality in which they occur. In Custer county, Dakota, are found immense deposits of quartz (surface concentrations) that fill a whole valley, but rest like a saucer in the hollow of the valley. Being auriferous, they added a larger per cent of gold than the veins enclosed in walls, and their presence lends color to the theory that the bulk of the placer gold came from the quartz masses deposited in the original gulches from the overflow of the veins at the time of their formation. True it is that a section rich in placer gold is poor in its veins, for as a rule a coarse gold or pocket section contains few milling ledges. As a rule, coarse gold is found in soft formations both in the beds of streams and in place. In the bedrock the gold slips over the polished surface of the crystalline rocks and is caught in the rough bedrock of the softer slates, as is seen in the Shepherd mine near Railroad Flat. In the soft, decomposed surface rock of the famous Morgan mine at Carson, $3,000,000 was taken from one surface pocket; but on sinking at this point the ore changed to a sulphuret milling proposition. Throughout the coarse gold sections the hills have a capping of soft talc slate or soapstone, which rests on harder slates. In these soft surface cappings are found pockets of coarse gold that are limited to the depth of these surface formations.

Accompanying many of the placer streams are bodies of limestone which show remnants of what were once veins of considerable size but are now, in many places, but the feather edge of the vein. A careful examination of most pocket sections will show that the coarse gold occurs at the point of contact of the surface feeders and the vein, while the much greater source is from the feeders themselves. It is evident that at the time when the fissures were formed the surface of the hill containing the vein was shattered and innumerable crevices formed. This condition did not extend downward, as the country rock in depth was solid and held in place by the surrounding rock. This shattered surface of soft rock was permeated by the vein matter and as these "feeders" were horizontal, or almost so, the gold readily formed in large masses, while in the vertical vein it was perhaps more evenly, but much more minutely, disseminated. These surfaces of soft base rocks rapidly wore away and filled the gulches and streams with their golden contents. Since then these naked hills have been clothed with verdure and the change from arctic to semi-tropic climate has almost checked the erosion of the hills. In proof of these statements I can refer to innumerable instances coming under my observation in Dakota, Colorado, Mexico and California, which but for the space required I would be pleased to quote. If the reader doubts the truth of my conclusions, he has but to go to an experienced mining operator with a piece of rock rich in coarse gold to be told: "Your mine is no good as a milling proposition. It is simply a surface pocket that no one but a pocket hunter would invest in." E. H. Schaeffle.

Black Sand Mining.

Prof. Washburn, of Corvallis, gives the following account of the beach mining on South beach, below Newport, Oregon: Along the beach south of Seal Rocks considerable activity is shown by resident miners and others in extracting fine gold from black sand, which is extremely abundant. Some of this sand yields fine returns, and some is not worth working. One area, not exceeding twenty yards square, is said to have yielded $16,000 worth of the real article not very long ago. The scene of operation is always at or near the point where some little creek contributes its mite to the ocean. Its water is led into a hopper into which gravel and sand is shoveled by the industrious miners. The fine sand, separating from the coarse gravel is carried through the sieve, ultimately reaching a long sluice box of matched flooring, about two feet wide, down which it is carried by the water. These sluice boxes are sold by Banta & Wincke, and previous to being used are soaked in a chemical solution which has such a strong affinity for gold that ninety per cent of all the gold in the sand, it is claimed, clings to the sluice and is saved. Be that as it may, the writer saw a generous coating of "the yellow" on a box beneath one sieve, the result of about six hours' work. Just what this chemical is is a secret of the inventors. The boxes are prepared by them and warranted to last a certain length of time; are sold to would-be miners, who can obtain a renewal of the chemical from time to time at a nominal cost. Parties who are working some of these claims tell me they are making $2 a day each, two men to the claim, which is fair wages for these times, and far better than doing nothing. The returns frequently exceed this, and have been known to reach as high as $20 a day for a series of days. The gold is brushed off the boxes, and when enough is collected to warrant a cleaning up, it is treated with mercury and the product sold to parties who forward it to the mint.—Del Norte Record.

Working Beach Sands.

To the Editor:—I notice with interest in your journal under date of October 13th, comment on an article of mine which appeared in the San Francisco *Evening Bulletin* of August 25th, in regard to "Sea Shore Gold and Black Sands." As your correspondent, Mr. Paul, made no mention of the process, I thought your readers might be interested in additional facts bearing on the matter. When I first attempted to solve the difficulties which all workers in black sand that I had seen maintained, I found in practical experiment that they, as well as myself, up to this time were off the trail, so to speak. Upon reversing the order of my proceeding, I at once found I was on the right track, and successfully accomplished my object for rapid separation, little expense, saving of magnetic ore, the float and fine gold, and where water is scarce it is used over and over again. A water-tight tank, movable or permanent, encloses the contrivance used, in which it is entirely submerged, whether large or small, while in operation, being so constructed as to flow the worthless product, instead of the water, which is conserved or wasted at pleasure after recovery of the floating particles. The water leaves the top level water mark in a partially quiescent state to an adjoining tank, where the particles, if any, are further concentrated and the water used over again. The sand is shoveled or dumped into the mouth of a hopper, which reaches the integral parts of the contrivance, the top of the tank being open and water always at or above water level. An electric current is utilized in such manner on the material as it passes through this contrivance in connection with the parts submerged therein, that a perfect separation is made of the iron in its own compartment, for which a separate outlet is made, also for the free gold. In some deposits the concentrated iron, to which particles of gold adhere, are oxidized, and if pressed through steel rolls the brightened surfaces are then susceptible to the mercury and the gold thus secured. A proper fire retort on a large scale will, however, give still more profitable results.

The cost of separating deposits carrying gold and iron by the above process would be very small; and a tank 8x8x10 feet would hold a contrivance capable of using 150 tons of beach sands per day of ten hours. Various methods might be used to deliver the sand to the hopper. The cost will vary according to location. Wherever located, the tank must stand sufficiently high, if permanent, to permit the waste material to drop underneath into a car or chute, to land it easily out of the way. In case the machine was on a dredge, the material would be lifted, delivered at one end, run through the machine and chuted to the other end to the water. In this way, bars or protected beaches where gold sands were bedded, could be worked rapidly and to great advantage. The power of the dredge could be used to pump the sands beneath by suction and run them over screens before reaching the inlet; a great amount of material could be utilized in this way. A syndicate of workers could adopt a machine for co-operative work on and along a great many parts of the Pacific coast and thus quintuple their daily efforts. A small storage battery for electricity, together with the service of one man, outside of pumping the water or elevating the sand to the hopper, would be all the power required to operate the concentrator. Abundant water, under slight pressure and control from any reservoir, would be of great advantage where work was desired on a large scale. If, as many maintain, these black sand deposits, which carry gold, extend inland some distance from the present line of beach, a permanent place could be found to work them, unaffected by the tide; and by excavating to sea level we could get the same deposit as is now made at the tidal line, at least in the vicinity where such deposits have been known to exist for years. If some enterprising men with capital and energy would assist me, I feel confident that rich returns would result and opportunities given to enable honest laborers in large number to secure values which at present are lying in a dormant, useless and unprofitable condition. This system should be attached to hydraulic, drift and placer work, and in some places it would be invaluable on the tailings of ordinary workings for which it can be adapted. E. W. Keeler.

San Francisco, Oct. 20, 1894. 712 Sutter St.

A Hoodoo Placers.

A representative of the *Miner and Electrician* visited the Hoodoo placer camp in Latah county, Idaho, during the past month and found the camp fairly prosperous. This district is reached from Palouse City, Wash., by a wagon road about twenty-four miles long and a good trail up the main Palouse river which is fifteen miles more to the summit. A gulch which gives the district its name was discovered twenty-six years ago by Frank Points, who has made several small fortunes there. Since that time the steep and short gulches have been worked every spring as long as snow water lasted and after that the bed of the main creek has been drained and cleaned up in places and much gold recovered. The latter form of work has been rather desultory, and in fact all the work has been on a small scale and conducted without capital or suitable appliances. There are one or two small ditches with a small flow and light head, but no systematic and thorough hydraulic work has yet been attempted. At the mouth of California gulch as high as $18 a day to the man has been made with rockers, and from the original discovery claim $12,000 was taken out, and at another point the Chinese have taken out at least $8,000 and how much more no one knows.

At present there are about twenty white men and something over that number of Chinamen on the ground, while each spring sees three times as many miners at work there.

The gold seems all to come from the old glacial wash which is high up on the bank, and which consists of a yellow gravel very different in all respects from the wash to be found in the creek bed. Where the steep gulches cut this, gold is always found, but between the gulches the creek bottom shows no pay dirt.

A company has recently been formed from among the employes of the Waltham Watch company to work some of this high ground by bringing in a ditch that will cover the points between a number of these gulches, and good results are looked for.

Lower down steam an Ohio company has taken up some ground and will bring water to it and develop it in a thorough way.

The county commissioners have been applied to to extend the wagon road from the mouth of the main gulch up half a dozen miles to reach the most important claims. A number of the county officials have interested themselves in the matter and the next season will probably see some important changes in this old camp. It has been learned from the banks of Palouse City and other reliable sources that the amount of gold produced this year will be about $10,000, exclusive of that the Chinese take out. Another year may see this sum trebled.

From the Yukon River.

William H. Paddock, E. J. Kendrick, J. P. Snyder, F. Jensen, C. Heinecke, W. Patrick and G. Schroeder came out from the Yukon last Monday evening, says the Alaska *Mining Record*, bringing the first news of the season from the interior over Chilkoot pass.

Mr. Snyder, with Kendrick and Robert Henderson, went up the Hootalinqua river and spent some time prospecting. Mr. Snyder says that a color can be found any place on the river, but the gold is not in sufficient quantity to justify one in working the most of the claims. Men who were at work there averaged about $3.50 per day. The party next went up the Pelly river, where, like the Hootalinqua, gold was found on every hand. He says that at first it naturally excites one, since it is no trouble to find as high as 500 or 600 colors to the pan, but the gold is so extremely fine that very few claims there justify one in staying. They could make but $5 a day with a rocker.

Two men, Peter Johnson and Julius Jensen of Douglas island, were working with a pump on a raft in the river, running the water to their ground, and in that way were able to make about $10 each per day. There were no provisions at Pelly, and Snyder and his companions were compelled to go to Sixty Mile for a grub stake. The Indians had also all left Pelly on account of the scarcity of provisions. Those who remained were fully equipped for the emergency.

In answer to a question asked Mr. Snyder as to what success he thought a hydraulic apparatus would be on Pelly river, he said the ground was so level that there would be difficulty in disposing of the waste, though the gold was in sufficient quantity to work one successfully under ordinary circumstances.

He is of the opinion that the tributaries of Forty and Sixty Mile creeks afford far better prospects than those of Pelly and Hootalinqua.

W. H. Paddock of Juneau has had two summers in the interior, and is well acquainted in the vicinity of Forty and Sixty Mile creeks. He reports that a new discovery on Glacier creek, a tributary of Sixty Mile, bids fair to rival the prosperous Miller creek, though the latter is giving better returns this year than last. The output of that creek this year is placed at $125,000—a sum not at all insignificant for a small stream. Some have taken out as high as $18,000 this summer, and the dirt runs from one cent to $4 per pan. Nothing has thus far been heard from the discoveries made last year on Birch creek.

Scientific Progress.

Interesting Experiments with Coal Dust.

A series of interesting experiments in shot firing and its effect npon coal dust took place at the Lower Duffryn collieries, Mountain Ash, on Augnst 6th. The object of the experiments, which were conducted by Mr. Gwilym Jones, the manager, was to determine the behavior of various explosives when covered with coal dust from the two-foot nine-inch and four-foot seams, both from roads and face of stalls. The first shot consisted of one and one-half pound of gnnpowder covered with a small quantity of fine coal dust from the two-foot seam roadways. The effect was a very large flame, which rose in the air to a height of about ten yards and produced an intense heat. The same qnantity of gunpowder was then tried with no coal dust, and resulted in a very mnch smaller and clearer flame. The next shot consisted of seven balls of compressed powder covered with some coal dust from the four-foot seam, and the same resnlt was experieuced as in the first experiment. A quantity of fine coal dust from the pit screens was tried with one pound of gnnpowder and two balls of compressed powder. This gave a larger flame still, accompanied with very great heat. The effect of experiments upon the dust from the face of the workings created some amount of surprise. A quantity of dnst from the stalls in the four-foot seam was charged with one pound of gunpowder and two balls of compressed powder, and resulted iu a larger and greater volume of flame and heat than that of the old dust. Half a pound of robnrite (equaling oue and one-half ponnd of gunpowder in strength) was tried in the same amount of dnst. Fired electrically, it made a loud report, bnt there was no flame. Half a ponnd of ammonite fired with small coal from the face of the four-foot workings, and auother charge of one pound of compressed powder covered with fine dnst, and placed within a short distauce of each other, were fired electrically. The former was fired first and the latter immediately afterwards, to test the firing of dust in the air. The first shot caused no flame, but the second caused a large flame in the dust while in the air. Three-qnarters of a ponnd of carbonite was also tried, but no flame was emitted. Mr. Joues then experimented in an arch thirty-five yards long, with the floor and sides constructed of crossed timber. Strips of boards were run along the sides in three rows to hold dust, so as to resemble the roadways underground, and coal dust was strewn about the floor, roof aud sides. The first experiment was made with a charge of oue ponnd of gunpowder to resemble a volume of gas, aud to see whether it would ignite the dust and produce a continuatiou of the flame through the arch. The powder fired in the ordinary way, bnt did not ignite the dust. One pound each of gun and compressed powder were tried, and ignited the dust immediately on the explosion of the powder, but, there being no current of air, the continuation of the flame did not take place. Experiments with cannon were then made, but did not cause an explosion of dnst, the place proving not very suitable for the experiment. The experiments were admirably conducted, and proved very interesting to the large number of people who witnessed them. The result showed very clearly that the ordinary gnnpowder, both loose and compressed, would fire the dust, whereas the high explosives made no flame.—Iron and Coal Trades Review.

The Direct Production of Zinc in the Blast Furnace.

In a paper recently published in the *Berg-und Hutten mannische Zeitung*, Mr. W. Hempel, after reviewing the methods proposed at different times for the reduction of zinc ores without the use of retorts, describes a number of experimeuts made in this direction by himself at the Technical High School at Dresden. It was snpposed that metallic zinc might be separated from furnace gases in a melted form by subjecting the current to the action of a centrifugal machine at a temperature below the boiling point of the metal; but a trial made at 470° Cent. proved a complete failure, only zinc dust and oxide being produced, aud other experimeuts showed that the nature of the product of ordinary distillation depended not merely on the nature of the gaseous atmosphere in which the zinc vapor forms, but that the degree of dilution is also of importance. Thus, in the reduction of zinc oxide in the Silesian or Belgian furnace, large qnantities of zinc dust are formed in the earlier stages of the distillation, liquid zinc being only obtained in a subsequent stage of the operation. This is due to the large quantity of indifferent gases given off by charge at first, which carry away a considerable amount of zinc as vapor before it can coalesce into the liquid form. The received opinion that zinc oxide is only reduced at temperatures above the boiling point of the metal is considered by the author to be erroneous, and that it actually takes place at a strong red heat. The presence of uncondensable gases in large quantity being a necessary condition of blast furnace working, the non-productiou of liquid zinc by the method of direct reduction is sufficiently explained. If, however, the reduction is effected in an atmosphere containing a minimum of carbonic acid, and the gases when cooled to 60° Cent. are passed through a centrifugal machine, the zinc contained may be collected as dust containing from 72 to 90 per cent of metallic zinc, silver, lead and copper in the ore being also volatilized as sulphides, but iron remains in the furnace. The author considers, therefore, that the ordinary process of zinc smelting might be modified as follows:

1. The ore, whether calamine or blende, must be carefully roasted to convert it as nearly as possible into oxide.
2. The zinc oxide mixed with three times its weight in bituminous coal and 5 per cent of lime is coked, giving a material with 22.7 per cent zinc, partly in metallic form.
3. The zinc coke is burned by hot blast in a closed top furnace, with a flue at the top connected with a centrifugal machine. The zinc volatilized and carried off by the gases is collected in the flues and the drum of the centrifugal machine. The gases when cleaned are utilized as fuel.
4. The zinc dust is subjected to a pressure of about 1500 pounds per square inch, which reduces it to about 10 per cent of its original bulk, making it perfectly compact.
5. The compressed zinc dust is distilled in retorts without the addition of carbon, when about two-thirds of its weight of metallic zinc of great purity is obtained. Lead and silver if present remain in the fixed residue. This operation requires much less fuel for heating than the ordinary method of reducing, as the material in the retort, being practically metallic zinc, is a good conductor of heat when compared with the mixture of zinc oxide and carbon, which is a very bad one.

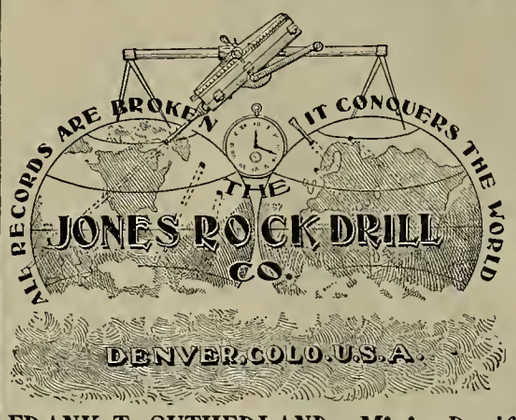
Probably a more complete reduction might be obtained electrolytically, as a lower tension current would be required than for the reduction of salts, the material being already in the metallic state to a great extent.—Engineering and Mining Journal.

THERE is a somewhat vague rumor afloat to the effect that all the lightships round the coasts of the British Isles will before long be connected telephonically with the shore, and that a system will be arranged by which a fishing boat, a trawler, or a merchantman's boat can make connection to a "wire" attached to a buoy, and send news ashore. Such an arrangement would have many advantages, particularly in time of war, when a cordon of telephones round the coast would be a most important addition to defensive armament.

THE JONES ROCK DRILL

IS THE

Only Successful Hand Power Drilling Machine Ever Invented.



It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

The Blasdel Concentrating Belt Co.

OWING to improved machinery we are now able to sell our NEW IMPROVED CONCENTRATING BELTS for the "Triumph" or Frue Vanners at reduced prices; also our Improved Belts six feet in width.

Practical mill men must see at a glance the advantage of our belts over any other.

First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.

Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.

We manufacture smooth belts with our Improved Flanges to order. Send for references.

Chilling Test Pieces With Liquid Carbonic Acid.

Writing on the use of liquid carbonic acid gas for chilling test pieces, especially stone, iron and steel at low temperatures, M. Ph. v. Haller, in the *Industrie Zeitung* of Riga, says that a cheap and simple form of apparatus in which the test specimens could be cooled would consist of a wooden box with double walls, top and bottom, the spaces between being filled with some non-conducting substance. The liquid gas could be led into such a box from the iron or steel flasks in which it is furnished, and would be deposited in great part in the form of frost at a temperature of about seventy-eight degrees Centigrade. The test specimens could be readily put into and taken from such a box, and would quickly get a low temperature. One of the Russian railroad companies is on the point of having such an apparatus constructed for testing rails and wheel tires at low temperatures. The possibility of accomplishing the desired object with such an outfit, viz., the rapid freezing of specimens, was demonstrated by putting a number of iron test pieces into a bag of several thicknesses of coarse cloth and then introducing the liquid gas. This at once became solid and filled all the spaces between the specimens which thus lay packed in snow. Each specimen was provided with a depression into which mercury could be poured, and on doing this, after a short exposure in the freezing bag, it was found that the mercury immediately solidified, showing, in the absence of a suitable thermometer, that the temperature of the specimens was certainly below thirty-nine degrees C., if not lower. At the St. Petersburg Laboratory of Experimental Medicine a cold room of quite large proportions has been fitted up in which also liquid carbonic acid is the cooling agent.

Recent Armor Plate Tests.

On the 4th inst., a four-inch Carnegie Harveyized nickle steel armor plate, curved to a radius of nine and a half feet, weighing 6300 pounds, and representing a group of armor of 293 tons for the barbettes of the Brooklyn and Iowa was tested at Indian Head. This plate was peculiar in having a large number of surface cracks, some of which were three-fourths of an inch deep and five-hundredths of an inch wide. Four similarly cracked plates have already been tested, supporting the theory that such cracks, which were caused by bending the plates, do not decrease the resistance. The plate had twenty per cent of its thickness consumed in these cracks and the Carnegies wanted to withdraw it, but finally determined to let it be tested.

The first shot was aimed at an uncracked portion, a four-inch thirty four pound Carpenter shell being used with a powder charge of eight and five-tenths pounds, giving a velocity of 1491 feet a second. The head of the shell perforated the plate, going six inches into the backing, a fragment remaining in the shot hole, while the body rebounded. The next shot had an impact blow—the first one immediately in the center of a group of numerous cracks. A Carpenter shell was used with nine and six-tenths pounds of powder and a velocity of 1595 feet a second. The shell was smashed up, flying into minute fragments, showing that the plate was stronger where cracked than elsewhere.

As an experiment a Carpenter shell with a velocity of 1676 feet a second and a charge of nine and eight-tenths pounds of powder, was then used. The shot struck ten inches from the second impact in a spot comparatively free from cracks and perforated the plate, but broke up.

These tests sustain a theory of armor experts that plates with cracks may be more effectively Harveyized and hardened, and it is thought that this discovery, if verified beyond doubt, may be utilized in future armor making.

On the 6th inst. an armor plate made by the Bethlehem Company was tested with satisfactory results. The plate tested was one of a group of Harveyized side armor for the battleship Texas. Three hundred tons were accepted. The plate shot at was eighteen feet two inches by six feet four inches and twelve inches thick, tapering to six inches. An eight-inch gun was used, with Holtzer projectiles weighing 250 pounds. In the first discharge seventy-nine and a half pounds of powder were used, and the projectile attained a speed 1678 feet a second. It was aimed at a point six feet and six inches from the side of the plate, and thirty-four inches from the top. It struck the mark fairly and was shattered, the point remaining imbedded in the plate. It was estimated that the penetration was about six inches. Not a crack of any kind was to be seen, and the shot seem to have no effect whatever upon its target.—American Manufacturer.

Fire-Resisting Glass.

An interesting test of fire-resisting materials and construction, says an exchange, was recently carried out in Berlin, under the auspices of the fire brigade and insurance companies of the city. The idea of the tests was moted as far back as 1889, but there was considerable difficulty in arranging for a series of "fires," which were intended to be as "natural" as possible, and yet should not be dangerous. Finally, the municipality gave the experimenters the use of an old warehouse for their purpose, and this building, having been fitted up to represent various types of fire-resisting structures, was duly set on fire. Care was taken to subject the exhibits to the temperatures, irregularities of heating, suddeu shocks by falling weights or jets of water, etc., which generally occur at conflagrations, and it was found possible to take fairly exact observatious. Among the most satisfactory results obtained were with the fire-resisting glass made by Messrs. Siemens of Dresden. The assessors declare it to be the most suitable for any skylight or window necessary in a division between separate risks, as it will resist a temperature of 1300° C. (2372° F.) for half an hour aud more, bearing all manner of shocks and strains without suffering appreciable damage. Care is required in fixing this glass, however, as the iron frames generally used for the purpose buckle under heat, and show, between the iron and glass, openings through which flame can pass. Some of the so-called fireproof floors made of iron girders and concrete came to speedy grief in these tests; while iron and brick floors stood very well, as did the "Monier" construction. As regards fireproof doors, nothing stood better than double oak covered with thin sheet iron, between which and the wood there should be a layer of asbestos cloth. Seeing how many warehouse fires are propagated through windows, the assessors attach great importance to their demonstration of the capability of Siemens glass for withstanding flame.

A Fuel Oil Test.

The fuel oil test on the tug Black Ball recently was a success. It was demonstrated to the satisfaction of all who witnessed the severe trial, that oil is practical, ecouomical and also smokeless. During the ten hours that the tug was in service, with its eugine working almost continually under a full head of steam, the smokestack emitted scarcely a hatful of smoke and the steam was kept at the "blowing-off point" every minute. There were plenty of skeptical witnesses present to see the test, but all were forced to admit that the demonstratiou was a surprise to them and no severe criticisms were made. Every effort was put forth to give the boat the most severe test possible by making her tow twice as heavy a load as ever before. Three of the largest mudscows on the river were taken from the north end of the drainage canal at Robey street, down the river and out into the lake beyond the two-mile crib, where they were dumped and towed back up the river empty. The trip was made in three hours and ten minutes. Owners of other tugs said before the trial that if the boat could tow one loaded scow to the mouth of the river in four hours, they would be satisfied and would admit the trial a success. The tug could not have made the trip at all with coal for fuel, but with oil she had steam to spare on her return.—Marine Record.

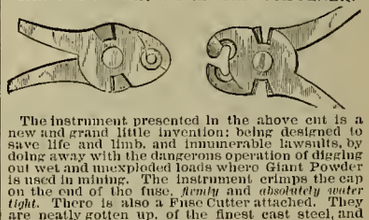
Improved Facilities! Finest Work! Lowest Prices
Perforated Sheet Metals, Steel, Russia Iron, American Planish, Zinc, Copper and Brass Screens for All Uses.
—MINING SCREENS A SPECIALTY.—
221 and 223 First Street, San Francisco, Cal.

GIANT POWDER FURE CAP FASTENER.


The instrument presented in the above cut is a new and grand little invention: being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.

Practical Treatise on Hydraulic Mining.
BY AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

LIGHTNING LARGEST WELL MACHINERY Works.
All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

EXTENSION OF PLYMOUTH.— *Ledger:* The Extension Mining Company has extended its financial interests to Paris, whose $500,000 has been added to the company's capital. It is proposed to continue prospecting until such time as there is either a bonanza secured or a certainty exists that the ledges they are now working on do not increase in value with depth.

THE HENDY OF NASHVILLE.—The same people who are prospecting the Lucille have purchased the Hendy mine in El Dorado county and placed D. O. Wickman in charge. It, like their other properties they are handling, is to be thoroughly prospected.

THE RICHMOND OF ENTERPRISE.—The Lucille capitalists have bought the Richmond, an early-day property, and purchased a mill, which they will erect thereon in order to make a thorough test of the ore. Judge Kroning has been placed in charge of the property, and has given several of Plymouth's young men work there.

AT THE GOVER OF DRYTOWN.—At the Gover mine it begins to look like old times again. Four hundred cords of wood have been ordered and several teams are now engaged in hauling. Poles, lagging, timbers, etc., are also coming in. The new electric pump will soon be ready to start. Four electricians are busily engaged in placing it in position.

BLACK HILLS, SEATON AND POTOSI OF DRYTOWN.—It is rumored that some mining men have been making a tour of inspection through the tunnels and works of Black Hills and Seaton, also of Potosi. We expect to see some of these claims in operation again before many months.

Mr. Robertson, who has had charge of the Oneida for many years, has commenced to clean out an old shaft near the cemetery in Plymouth. The shaft was down eighty feet on the ledge, and he intends to prospect it thoroughly to a reasonable depth.

Calaveras.

BIRNEY MINE.—Angels *Echo:* Twenty-five men are now at work in the Birney mine, near Angels, and the mill, which has been in course of construction for several weeks, is nearly completed. The mill will have a capacity of ten stamps, but only five will be put in at present.

Nevada.

WASHINGTON DISTRICT.—Nevada City *Herald:* The Chinese company which has leased the Omega mine and bed of Scotchman's creek, is about to erect a dam at the latter place, to restrain the debris from the mine at Omega. They will also reconstruct the Scotchman's creek ditch. Towle Bros.' teams have been busy for the past two weeks hauling in lumber for the work. It is to be regretted that white men did not obtain the lease, for in that case it would have been of great benefit to the community. The Omega mine has a good reputation as a gold producer.

In running the tunnel at the Giant King mine some very hard rock has been encountered, which makes progress very slow. A number of large stringers containing gold-bearing quartz have been cut through, some of them being as large as an ordinary ledge in other places; but the main ledge, which is an immense one, has not yet been struck. From the latest calculations it is expected that the wall will be reached at 436 feet. The tunnel is now in about 420 feet.

The Rocky Bar Gravel Mining Company is making preparations to sluice off the shallow ground. Old residents in this section say that when the adjoining ground was worked it yielded very good returns, and the company that operated there worked up to the limit of their claim. It is to be hoped that the present company will be successful, as they have spent a great deal of money in the enterprise.

The Mountain View Mining Company is pushing its tunnel ahead as rapidly as possible. The tunnel is being run to tap the ledge and is now in about 125 feet. It is expected that seventy-five feet more will bring them to the footwall.

The work of repairing the Bloomfield, Lake, Milton and others of the large ditches, has been going on for the past week or two, and in consequence the mills obtaining power therefrom have been shut down. The work is nearly completed, however, and they will then resume.

The Rainbow mine, in God's Country, of which Mr. C. J. Garland is superintendent, continues to look as favorable as ever, and quite a force of men is at work. The mill at this mine is one of those that obtain power from the Bloomfield ditch, and is of course closed down at present, but the superintendent says he expects that they will have it running in a few days.

The miners from the Culbertson mine report that everything is lovely there and the mine is doing well. This mine is under the management of David Moore.

ENGLISH MOUNTAIN MINE.—Truckee *Republican:* Much interest is being centered in the country around the English Mountain mine. Much prospecting is being done and good quartz is being found in the mountains all around that vicinity. Several Truckeeites have located ground around there and there is a good prospect of there being lively times out in that camp next spring. The English Mountain Mining Company are putting up a big quartz mill with a good number of stamps, and have had about 100 men working for some time past. They will start up in full blast next spring. Meadow Lake country has been rich in gold, and in past years has furnished her quota to the gold of the State, and it is not by any means worked out. Mining is reviving in that part, and, from the prospects, it will be sending gold to San Francisco for some time to come. The English Mountain is about eight or ten miles from Webber lake. If present indications go for anything, Truckee will reap much benefit from those mines in the near future. We trust every effort will be used to direct the traffic this way.

SAN JUAN RIDGE.—Grass Valley *Union:* San Juan is picking up considerable. A great deal of prospectiug is being done for quartz.

The Boss mine is looking well. They have about twenty-three men employed.

Crane & Wright are pushing their tunnel ahead with good prospects.

The Huckins Bros., who own the extension of the Boss mine on the north end of the river, are pushing their tunnel ahead from the river side, and also have their house about completed on Yuba ravine.

The McCullough Bros., who have leased the Junction mine from the Huckins Bros., have their mill about completed, and will be ready to run in a few days.

DAISY HILL MINE.—Grass Valley *Telegraph:* We are very pleased to state that a fine ledge of rock has just been struck in the Daisy Hill mine. The ledge, which is twenty-six inches wide, is north of the shaft about four feet; it shows free gold all through and prospects very high. Some of the experts that have seen it claim that it is the best prospect seen in Grass Valley in many years. The amount of work done at this mine since Messrs. Kingsley and Taylor took hold of it, is simply astonishing—a hoisting and pumping plant, buildings, a shaft close to 250 feet in depth, and all done in about four months. The latest improvement is an electric plant for lighting purposes, and the miners drill in the mine by electric light.

A PLEASANT RIDGE MINE. — Nevada City *Herald:* The Live Oak Consolidated Mining Company has levied assessment No. 5 of ten cents per share. The money thus raised is being used to develop the mine, which bids fair to become a valuable property. The Live Oak Con. is situated down on Pleasant Ridge, and though there are no other quartz mines near, this mine has a well doveloped ledge that assays well and has stood some thorough mill tests. The company has prospected all along their ledge, which is a flat one and lies near the surface, and found good ore wherever they sunk. The ledge runs right along the top of a ridge, where no water could be had, and the mine was dry, too. Steam power was used, but they could not get enough water for the engine and mill, so a ditch several miles long was run, and has just been completed. Now the mine is running again, and no further trouble is anticipated. Richard Stager of Grass Valley is superintendent. The Live Oak Con. is owned by several well-to-do business men of Sacramento, chiefly Germans. They are a plucky company and spend money without stint.

PAYS WELL. — *Transcript:* William R. Thomas & Co., lessees of the Morgan & Tilley ledge on Mosquito creek, have just received returns from a lot of quartz sent to the Selby Smelting Works. The net yield to them is $25 per ton. The rock came from the bottom of the shaft, where the ledge is about two feet wide. A crosscut is being run and will tap the ledge in about twenty feet more. In the Niagara ledge, which is situated a few hundred feet distant, the same kind of rock is found, and the results met with in the Morgan & Tilley have caused the owners of the Niagara to begin to make arrangements for working their mine.

Placer.

HASKELL. — Placer *Republican:* Developments in the Haskell mine are looking better all the time, and the owners are satisfied of some very rich yields in the near future. This property is a gravel mine situated on the Gaylord place, a short distance southwest of this city. The mine was incorporated last June with a capital stock of $100,000, and has been one of the most thrifty pieces of mining property in this section.

A. O. Bell is preparing to erect a five-stamp mill on his quartz mine near Emigrant Gap. Mr. Bell is probably the most successful prospector in this section, and he feels confident that his present claim will be as rich as his former ones have been. The rock will average from $25 to $30 per ton.

Plumas.

LA PORTE MINING ITEMS.—*National-Bulletin:* Six New York capitalists, a few days ago, were up to look at a large mining property at Cleghorn's Bar, owned by McClellan & Post. They spent nearly a week in examining the property, then returned to San Francisco. Their engineer remained to complete a survey, which he did and departed Tuesday. It is very probable that a sale of the mine will be effected and operations commenced.

The difficulties which have prevented the working of the Slate Creek mine are to be adjusted. An agent of the company came up to La Porte on Monday. He said he came to pay up the indebtedness, to the end that operations might be resumed. This will be good news to the people of that section. This is an extensive and valuable property.

The Thistle Shaft is reported to be doing better than ever before. They have just struck into the main channel and the gravel is said to be rich. The company employs seventy men, not including those on contract work. Five new dwellings are going up at the mine. This mine has fully demonstrated the great wealth which lies hidden in the ancient channel in the ridge extending from Gibsonville down to La Porte.

Above and adjoining the Thistle Shaft ground is that owned by Horace Taher. He has a tunnel far into the mountain and thinks he is within a few feet of the channel. Lack of funds has caused him to suspend work temporarily. Here is one of the best opportunities for capital to be found in this part of the State.

It is probable that the Iowa Consolidated placer mine, owned by Mr. Brabhan, will be opened up not later than spring. Mr. Brabban is making arrangements with that object in view.

Meikle & Wolters have the Hepsidam mine leased and are working it with reasonably good success. They employ about twenty men.

The Excelsior mine, owned by Hendell and others, is working a small force of men.

The Pioneer drift mine at Grass Flat has a large force of men employed. This property is owned by Diesen & Cowdery and is yielding handsomely.

MINING SALE.—Plumas *National-Bulletin:* Last evening Messrs. P. A. Wagner, H. A. Swift and Joe Peppin came down from Granite Basin. Messrs. Wagner, Swift and others have purchased of Peppin the Christie quartz mine and taken a bond on the Golden Carrier.

Mr. Wagner is the manager of the Judson Works, and is very wealthy. It is the intention of the new owners to erect a new quartz mill as soon as possible, and for that purpose have already ordered the machinery, lumber, etc. Quite a number of men will be put to work immediately.

San Diego.

PROSPEROUS GOLDEN CROSS.—Yuma *Journal:* The last cleanup at the mill was the largest yet made. It is not known how much it was, as the company has no information to give out. Four guards took the bullion to the station.

Dubravich, Johnson and McGlone are still working their mines, and they are showing better. McMahan, Lawrence and Ralham are working another claim, and they have good ore in sight. The stage to Ogilby now runs with four mules to handle the business.

Shasta.

A BONANZA MINE.—Redding *Free Press:* R. G. Hart of the Texas Consolidated mine presents some figures that astonish us relative to the mine. They are taking out ore from the fifth level—a depth of 910 feet. Their tunnel is in 1700 feet, and they have an exceedingly rich pay chute 160 feet long with a ledge varying in thickness from twelve to fourteen feet. During the last five weeks, from ore shipments, they made a total net return of $22,197.82, as follows: First week, $4606.83; second week, $4739.87; third week, $3650.32; fourth week, $3723.65; fifth week, $5277.10. During the last three months the mine has produced $60,000.

On the river the Diestlehorst dredger has struck a rich bar just above Middle creek and is scooping up the yellow gold day and night.

W. P. Miller's model ten-stamp mill runs ten hours a day. Electricity will soon be introduced in connection with cyanide to work slums and concentrates.

On what is known as Pigeon Ridge, Messrs. Lockhart and McCormick are doing development work on two twenty-five foot ledges.

In the Watson Gulch district several ditches are being put in order for the winter.

At Arbuckle six men are getting ditches ready for the winter rains. Some Red Bluff people are proprietors of a gravel bank at Round Boulder creek.

At Sunny Hill, W. H. Smith is running a drift west from the 200-foot level to cut a parallel vein which shows on the surface.

At Ono some cement claims are being drained and prepared for work when water comes.

On the south fork of Clear creek E. L. Ballou reports working twenty tons of ore for the Kingsbury Bros. that went $50 to the ton.

At Muletown, Jones & Christensen keep their mill going on their own ore.

The Chinamen on Clear creek, just below Igo, continue taking out gold by the quart. John has got a piece of virgin ground and is making a scoop.

Boswell & Bro. have ten tons of ore sorted and ready to ship. This is from their Muletown claim, where the ore averages $190 to the ton, and is on land claimed by certain settlers as agricultural in character.

Senator John P. Jones contemplates doing hydraulic work on his Clear creek gravel mines the coming winter.

Considerable work is being done on claims in the vicinity of Nigger Hill. Some are showing fine ore dumps.

Two Montana men are negotiating for property near the county hospital building. The ore assays up in the hundreds.

The starting of the mill at Iron mountain makes things look like old times.

James Salee has forty feet of drifts run on the 100-foot level on the old Spanish mine at Upper Springs, with four feet of $20 free-milling ore. Timbers are being sawed out for the ten-stamp mill.

The Ellery boys are exposing some fine ore in their prospect.

Jack Conant's mill on the Wheeler or American mine is being rushed along. Jack says his ten stamps will be dropping on November 10th.

The Uncle Sam mine on Squaw creek has been working some very high-grade ore of late.

A new deal is pending on the Snyder mine, so it is reported.

The Balla Klalala mine at Windy camp has not been sold as reported. Several suits over commissions are on the tapis. Matters may be patched up, however.

Col. Lyons, manager of the Rich Gulch Co. at Old Diggings, returned this week from St. Louis, and will renew work on the company's property.

At Copper City the placer miners are making good wages. Popejoy and Zinn both make good clean-ups.

The Walker mine has completed 1200 feet of tunnel and made an upraise forty-two feet to connect with the old workings. They cut twenty-four feet of high-grade gold ore. None of it runs less than $25 in gold.

Mr. Anthony, superintendent of the Central mine, received orders to push the tunnels and show up the ore bodies before spring. Roasting furnaces and barrel chloriuation will be put in their mill, and the Central will roll out the yellow bricks once more.

The strike in the Texas Consolidated will set the ball rolling. Ed Reid will commence working his mine next week. The ore from this mine runs up in the hundreds, but an excess of water has been the harrier to successful working.

At Quartz Hill, Maryanski reports finding a body of high-grade gold ore. It is supposed to extend from the surface workings to the 100-foot crosscut tunnel. Tom Harrison is having some trouble in getting his final payments for the property.

At the T-Shasta Bar tunnel above Elmore, where Charley Morton has the river drained, he reports making $4 per day to the man.

Sierra.

THE ALASKA MINE.—*Mt. Messenger:* We understand that the Alaska mine, near Pike City, has been sold to a San Francisco company. It has been found absolutely necessary to sink a new shaft on a ledge parallel to the one on which they are now working, and the old company had not the capital to go ahead on. On a report of the mine by G. H. O. Sunderhaus, the new company bought the ground and will immediately commence operations. They will put in an electric plant from the Middle Yuba river and run all their machinery by electricity, thus doing away with the costly steam now employed. The company estimate that it will take over $50,000 to properly open up and develop the mine. W. W. Casserly will still remain in charge of the property. This is known to be a good piece of property, and will pay well if intelligently worked.

Siskiyou.

QUARTZ AND GRAVEL.—Yreka *Journal:* The Schroeder quartz mine at Deadwood is yielding good returns, and the mill is kept in steady operation day and night. A large force of men is at work in the tunnels stoping quartz, so that there will be no cessation in crushing until the winter storms interfere in the way of deep snow on the mountain.

Austin & Co., of the Grenhorn blue gravel mine, have struck very rich looking blue gravel at the new shaft recently sunk near the original prospecting shaft, but owing to scarcity of water the gravel is wheeled out on cars to await the rainy season period, commencing in December.

The Empire quartz mill, at Empire creek, Klamath river, near Honolulu, is now kept in steady operation under the supervision of the Hogler boys, with an abundance of quartz on hand and a large ledge to continually maintain the supply. The men in charge say the quartz now going through the mill will yield about $15 a ton, and we earnestly hope their belief may prove true, as the enterprising owner, Chas. Junker of Yreka, has sunk an immense sum of money in developing this mine, which gives every encouragement of eventually becoming very valuable mining property.

Trinity.

AT BULLYCHOOP.—Trinity *Journal:* W. J. Grigsby was in from Bullychoop and reports the prospects of that camp as very favorable. He has a lease on the Bullychoop mine and is putting in steam power to run a five-stamp mill and the two arrastras now on the ground. He will be ready to run as soon as two castings, expected daily, arrive. He is working twelve men, and will work right through the winter. The ledge is strong and is looking well. Mr. Grigsby has a new method of treating rebellious ores which is very successful and does away with the necessity of shipping them away. There is a good deal of work being done at the camp this fall and its future is very promising.

Tuolumne.

THE RAPPAHANNOCK MINE.—Sonora *Democrat:* This celebrated lode is now under process of vigorous development by our esteemed townsman Richard Chute. The lode was very rich in free gold and sulphurets twenty years ago, but until Mr. Chute acquired title thereto nothing had been done since. The old shaft had been sunk to a depth of 112 feet, and at a short distance above the bottom the chute pitched out of the shaft and was lost. In the old shaft the lode vein matter and all the quartz matrix gave fine results and much was anticipated, but the losing of the vein terminated operations. Subsequently Mr. Chute came into ownership of the property, and he with characteristic energy immediately erected fine, substantial hoisting works, and now has a shaft down seventy feet, which is intended to tap the old shaft and open up the lode at the point where it was lost. The quartz and the entire vein matter in the new shaft prospect well in free gold, and carry about three per cent of sulphurets which assay high in gold. From the known and established richness of this claim, and from the fact of its being the immediate continuance of the Rawhide mine, a great future is reasonably expected from its operation. The hoisting works have all the necessary modern equipments, and its large, splendid engine is calculated to sink the shaft to a depth of 1000 feet. At present twelve men are employed at the mine and work is carried steadily along. Recently Mr. Chute removed thither the Lamphear stamp mill from Confidence, and in due course of time it will be in operation.

NOTES FROM BIG OAK FLAT AND GROVELAND.—Mining matters have been looking up a little this summer in these localities. Mr. Albert Mack has a shaft down some fifty feet on the Perrin mine (now Mr. Mack's property). This was a paying mine in old times.

Mr. C. L. Mast has a shaft down some distance on the Mississippi at B. O. Flat, and has put up steam hoisting works. The work is temporarily suspended, but will be resumed shortly.

Messrs. Lowe and Maguire of San Francisco bought the Stanley and Bean mine near Groveland, and are now engaged in develop-

ing the same. They have a strong vein and some very rich ore. They have a large quantity of quartz out to be crushed as soon as there is water to run the Big Creek mill.

Mr. L. Cassaretto has leased his mine, the Kamika, situated N. E. of Groveland, to some San Francisco capitalists, with privilege of buying. They intend to add five stamps to the mill and run by steam power when there is not enough water.

The Belcher at Deer Flat is idle for the present, but Mr. Hill, the energetic superintendent, expects to start up again soon.

A few of the boys have done quite well this summer at pocket mining.

AN OLD DUMP.—Tuolumne *Independent:* Billy Johns, or "Commodore Johns" as he is generally termed, working at the Keltz, went prospecting on the dump of the old Continental mine, one mile above the Riverside, where he picked up rich specimens of ore. This dump was ore taken out of the mine 30 years ago, and abandoned. He supposed it was a piece some one had dropped there; but, prospecting through the dump, he found several pieces showing gold freely. He estimates of the 100 tons there, 60 or 70 tons will pay $15 per ton. He then investigated the old shaft, the timbers of which had been partially burned out, and dug pieces out of the vein which, he said, gave the best prospects he had ever found. The vein crosses the river and can be tunneled into from either side. This may prove to be another valuable discovery.

A Sacramento company have relocated the old Deacon claim on Saw Mill Flat, which in the early sixties was owned by the Graham brothers. This old mine was valuable and has yielded many a fortune.

Wm. Sharwood went below Monday to get a steam pump to relieve the Carlotta mine of an overdose of water, prior to an inspection by several San Francisco capitalists, who will there find a good and safe investment.

It is rumored that Messrs. Leachman and Sharwood have leased the Symous mine and will begin operations at once.

NEVADA.

Washoe District.

SAVAGE.—Virginia *Enterprise:* On the 1100 level in the north lateral drift, started from the east drift, they continue to extract ore on the sill floor upward to the sixth floor. The south drift started from the east drift was advanced ten feet; total length sixty-one feet. Face in quartz and porphyry. During the week we have hoisted twenty-eight cars of ore. Car samples average $24 per ton. On the 1050 level the south drift started from the east drift thirty feet from the south ore stopes they are stoping out fair-grade ore. At a point eighty feet north of the south boundary they have started a west crosscut, and advanced the same eleven feet; face in quartz and porphyry. On the 1100 level, fifty feet back of the face of the north lateral drift, they have started east and west crosscuts, and advanced the same sixteen and fourteen feet respectively in quartz and porphyry. They are uptaising in the ore on the west side of the north lateral drift. The east drift from the new station at the 950 level was advanced twenty-two feet; total length forty-seven feet; face in quartz and porphyry.

CHOLLAR.—The winze from the north crosscut, 450 level, started last week, is now down thirteen feet; the bottom shows a width of seven feet of ore of good grade, face samples running from $25 to $60 per ton.

We are opening the old stopes on this level, from which we are getting spots of good ore in place and fillings of fair grade.

On the 555 level the main north drift has been cleaned out and retimbered fifty-five feet for the week.

From the openings on the 450 level we have saved and shipped to the Nevada mill for reduction 521 tons and 1800 pounds of ore, the average battery samples of which was $37.95.

POTOSI.—Crosscut No. 5, started from the south drift, 450 level, was extended twenty-one feet; total length one hundred and two feet. Face in clay and porphyry.

The winze from the 450 level, 200 feet south of the north line, is down twelve feet and the bottom shows a width of two feet six inches of ore, giving assays from $25 to $50 per ton. From this winze we have saved 31 tons and 900 pounds of ore, which has been sent to the Nevada mill for reduction.

At the croppings we have stopped the northwest drift and resumed sinking the shaft.

S. N., M. & U. SHAFT.—The east crosscut from the north lateral drift, 450 feet north of the west drift, 1520 feet west of the shaft, 900 level, has been advanced during the week eighteen feet; total length, 138 feet; face in quartz, clay and porphyry.

The west crosscut from the Union Con. south lateral drift from the west, 1520 feet west of the shaft, 900 level, has been extended twenty-five feet during the week; total length, 147 feet; face in clay and porphyry.

CROWN POINT.—The west crosscut from the south drift on the 500 level is in porphyry. The north drift on the 650 level is in the same character of material as reported last week. The east crosscut on the 800 level is in vein material composed principally of porphyry. There were extracted from openings on the 600 and 700 levels during the past week, 632¼ tons of ore which has been shipped to the Mexican mill for reduction, the average battery samples of which was $9.22, of which $8.17 was gold.

BULLION.—The west drift from the Ward shaft, 820 level, has been extended fifteen feet during the week; total length 1147 feet; face in soft porphyry and clay with a strong flow of water.

UNION SHAFT.—East crosscut from the north lateral drift, 450 feet north of west drift, 1520 feet west of shaft, 900 level, has been advanced during the week eighteen feet; total length 138 feet; face in quartz, clay and porphyry. The west crosscut from Union Con. south lateral drift from west drift, 1520 feet west of shaft, has been extended twenty-five feet during the week; total length, 147 feet; face in clay and porphyry.

SIERRA NEVADA.—The northwest drift at a point 160 feet west of the mouth of the Layton tunnel, is out eighty-seven feet; advanced thirty-two feet during the week; face in porphyry and quartz.

The east crosscut No. 1 from north lateral drift No. 2, at a point 140 feet north of intermediate tunnel, is out fifty-two feet; advanced twenty-two feet during the week; face in quartz and porphyry.

BELCHER.—The east crosscut on the 400 level has been cleaned out and repaired thirteen feet during the week. The same work is going on at the 1000 level in the main north drift and west crosscut. Also in the east crosscut on the 1000 level. Twenty tons of ore were hoisted during the past week.

SILVER HILL.—The south drift from the winze, forty-five feet below the fifty level and 260 feet southwest of shaft, has been advanced during the week fifteen feet; total distance from the winze twenty feet; the face shows two feet of milling gold ore of fair grade.

WARD COMBINATION SHAFT.—The west drift from Ward shaft, 820 level, was advanced fifteen feet during the week; total length, 1147 feet; face in soft porphyry with a strong flow of water.

ALPHA.—During the past week have cleaned out and retimbered fifteen feet of the shaft below the 382 level; total depth of shaft cleaned out and retimbered, 417 feet.

ARIZONA.

THE DIAMOND JOE MINE.—Mohave County *Miner:* We understand that the Diamond Joe mine of Cedar district has been bonded to Mohave county parties, and that the probability is the property will change hands in a short time. This mine has been a steady producer of rich ore for several years past, although worked in a crude manner. The sales from ore have netted fully $70,000, at the low price of silver. So far the main shaft on the property has been carried down 240 feet, and at the bottom, ore far richer than that found on the surface has been found. A tunnel 400 feet in length taps the shaft near the 150-foot level. Last summer a new shaft was sunk to a depth of fifty feet, and a cave in the hanging wall revealed a large body of rich ore in a parallel ledge unknown before that time to the owner. This body of ore has been worked on ever since its discovery. At no time since its discovery has the mine failed to pay its way, and if it had been worked in a systematic manner, it would have become the producer of large dividends. We hope the sale will go through, as it will aid in developing that rich section of Mohave county.

OREGON.

NEW CLAIMS.—Jacksonville *Times:* Quite a number of mining claims have recently been located at the head of the Chetco, in Curry county, by a company of Kerbyville miners, who are supposed to represent San Francisco parties.

A twenty-stamp Tremaine mill has been erected at the Copper Stein mine, in Mount Reuben district, and will soon be grinding. A tunnel taps the vein at a depth of fifty feet and the rock is thought to be rich.

The Ashland Company, for whom R. M. Garrett has been prospecting on Williams creek, has suspended operations, some of the members having failed to produce the sinews of war necessary to carry on the work.

Work on the Clay Dollarhide coal mine, near Pilot Rock, is being prosecuted by parties who are interested with Mr. D. in the claims. These deposits and the Tolman discovery, northeast of Medford, if they prove what is expected of them, will open a new industry in this section.

A late cleanup at the Bohemia mines, after a run of less than thirty days, resulted in $7000 worth of gold dust. The mill has shut down to do certain development work. Active work has been resumed by the owners of the Annie mine, the sale of the property reported a short time ago having failed to materialize.

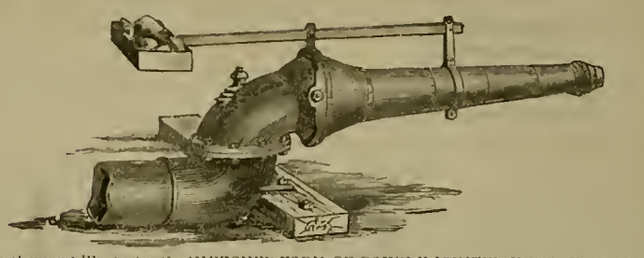
FROM CORNUCOPIA. — Bedrock *Democrat:* Messrs. Wolters and Peters, of Louisville, Ky., who have been looking after their mining interests at Cornucopia for the past two months, informed the *Democrat* that the mines of that district are making a great showing and predicts a bright future for the camp.

The Red Jacket twenty-stamp mill will be moved in the spring from its present site, a short distance above the town, to the mine, which move will do away with the heavy expense of running the tramway, it being damaged every winter by snow slides and necessitating the closing down of the entire plant. These gentlemen are heavy stockholders in the Oregon Gold Mining Company, the owners of the Red Jacket, which is now in litigation, and they confidently expect the matter to be settled in the courts in the courts in the course of a few months, when active operations will be commenced and the property worked on a larger scale.

MONTANA.

THE MAMMOTH MILL.—*New Northwest:* Superintendent Simpson of the Mammoth was over from Sunset on Wednesday. He reports the work preliminary to putting in the new stamp mill as progressing favorably. A road is now building from the divide near the mine six miles to connect with the Camas road and Bonner. At the latter place battery and other heavy timbers essential to the structure are now being gotten out, and the shipment of the plant from Butte to that point will be made directly the six miles of new road is finished. Mr. Simpson anticipates the mill will be up and running within sixty days at the furthest.

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

STANDARD ELECTRICAL DICTIONARY.

By Prof. T. O'CONOR SLOANE.

Author of "Arithmetic of Electricity," "Electricity Simplified," Etc.

The "Standard Electrical Dictionary" is what the work purports to be, exhausting the subject of electrical terms, giving each title the clearness of explanation necessary to make the understanding of it complete, without unnecessary elaboration. In this work every electrical word, term or phrase will be found intelligently defined.

The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the every-day electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of the greatest science of the times.

624 Pages. 350 Illustrations.

Handsomely Bound in Cloth, 8vo. PRICE, $3. Extra Super Calendered Paper.

What is said of the STANDARD ELECTRICAL DICTIONARY.

The dictionary gives evidence of a large amount of painstaking work on the part of the author, and possesses features which must be commended. Among these, the author, wherever occasion required it, has furnished the synonyms of terms, and the hook is given an additional value by an alphabetical index, which enables it to be consulted for terms both collectively and individually. The work will prove of value to the reader, whether professional or non-professional. The definitions are put tersely and concisely, so that the inquiring reader can carry away a defined, net impression as to what is meant. Any student who will spend his leisure hours over the volume will be amply repaid for his time and trouble. The book is very clearly printed in bold type on good paper, and is well bound.—*N. Y. Electrical Engineer*

Electrical Progress.

Electric Lighting of Railway Carriages.

According to the experience of the Allgemeine Elektricitats-Gesellsshaft of Berlin, the simplest solntion of the problem of the electric illumiuation of passenger carriages on railways is to be fonnd iu accumulators pure and simple. We give in the following lines the main features of a system of train lighting by electricity, as recommended by the Allgemeine Elektricitats-Gesellschaft, chiefly ou the basis of their experience on the Dorsmnnd-Grouau Enschede line. It is one of the Government railways of Prussia, about 60 miles long, leading from the very bnsy Dorsmund district across the sparsely populated and qniet plains of northwest Westphalia, to the little town of Enschede, in the kingdom of the Netherlands, a few miles beyond the frontier. The plant has been rnnning for more than a year. The cells employed are a special type of the accumulators of the "Accumulatoren Fabrik Hagen," expressly made for the Berlin company. A battery capable of feeding five five-candle lamps for forty hours would weigh 467 pounds if discharged at fifteen volts; if 22.5 volts are desired, the weight rises to 516 pounds, if thirty volts, 591 pounds. The capacity should leave a rcserve of abont teu per ceut or more. As a rule, discharge at 22.5 volts requiring twelve cells, will answer best. A battery of this voltage, capable of feeding five sixteen-candle lamps for eight, twelve or sixteen honrs, would weigh 443, 516 and 562 ponnds respectively. If two lamps are desired for each compartment, two batteries with one lamp in each circuit would prevent a total extinction of the light, if the battery should give out. Two eight or ten candle lamps replacing one of the sixteeu-candle lamps just spoken of, wonld require batteries weighing 754 aud 886 pounds respectively, for twelve and sixteen hours' service. The cells are put in cases not too heavy to be managed by one man, and these cases placed under the cars, like the ordinary gas reservoirs.

As regards comparative weights, we are assured that the gas plant for five jets for forty hours would weigh about 1,000 pounds, whilst the equivalent electric plant, with a battery of twelve cells, would not weigh more than 640 pounds. Sometimes the cells are placed under the seats. The connections consist both of contact springs and of flexible cords. The discharged cells are exchanged and recharged in the lighting station. Where this is uot feasible, the charging may be doue on trucks ou some siding or with the cells in position, in which case the train has for hours to remain on that siding. This latter arrangement has not much to recommend it. A hiut given in the pamphlet that the somewhat impoverished cells taken out of a first-class carriage might still do for a third or fourth compartment, would hardly be welcomed in this country. For the Germau railways, the company reckon as minimum illnmination admissible: One lamp of sixteen candles for the first class, one of ten candles for the second aud third classes, and two lamps of six caudles for the fourth class. That would euable the first class traveler to read comfortably on any seat, and those in the second and third classes on four of the ten seats; but two lamps of eight or ten candles wonld be more convenient for the first two classes, and proportionately better light for the other two classes as well. The lamps used on oue line should, as much as possible, be of the same kind. The lamps of higher candle-power being more economical as regards current consumption, a good light can be given. Every battery needs a switch; the switches should be accessible to the gnard only. It has not been found profitable to allow passengers to turn the light on and off as they like, although a good deal of light might occasionally be saved if the passengers were considerate. The company do uot want the passengers to tonch anything but the screens. The statc of the battery is indicated by voltmeters or by Aubert's hour-counters. The latter are very simple, but as they only show for how many hours the battery has been discharging, they can be used only with constant and uninterrupted supply. The leads are put under wood or encased in gas-piping; on the enginc the wires are lead cables placed in gas pipes. Ample space is left everywhere between the two wires of each circuit. When desired, cisteru, boiler, eugine, dynamo, and cells are supplied, or a petroleum motor instead of the steam plant. These motors cannot be gnaranteed free of smell. On lines where trains run backward and forward without being uncoupled, the whole accnmulator plant may well be placed on a special trnck. This system is in use on some of the Danish isles and on the west coast of Sweden. About cost, the pamphlet—besides offeriug estimates—does not say anything beyond stating that the electric lighting of the Dortmund-Enschede liuc does not cause any higher expense than the illnmination by gas would cause, although the plant is neither large nor perfect as regards full utilization of the machinery. On this line the ordiuary officials look after the accumulators.

Effect of Electric Current on Varied Metal Pipe.

The evil effect of electric cnrrent ou snbterranean metal pipe was demonstrated in Chicago last week in a test made by Major C. E. Bliven, chairman of the electric hazards committee of the nnion, before members of the several local board commissions. A piece of iron pipe was buried in a barrel of damp dirt, and snbjected to the action of an electric current for 133 honrs. The test was made by rnnuing one end of a wire into the dirt and another one leading ont of it. The current, taking the iron as offering the least electrical resistance, passed through it for some distance and then jumped to the wire leading out. At the point where the wire left the pipe and passed throngh the earth the effect of the current was shown in the badly pitted iron, which was almost entirely destroyed.

The test was conducted in the laboratory of the electrical bureau of the Chicago Underwriters' Association, 176 Monroe street, and it was done to show the destrnctive effect of a current when passing through iron pipe which is buried and to demonstrate the importance of devisiug means to regulate the current of trolley roads which use the earth as a rcturn circuit. The result obtained showed this necessity. For some timc complaints have been coming in of the destruction of water pipes by return currents of trolley ststems. The curreut passes from the trolley wire down through the trolley aud the motor underneath the car, then into the rail and the earth. The current, in seeking the return route to the station where it was generated, seeks the route offering the least electrical resistance, and this is usually the water pipes running down the street. No harm is done the pipe, except the spot where the current leaves it and passes into the earth. There it corrodes the pipe, causing disintegration, which often results in a big hole which renders the pipe useless and causes the city or the water compauy to put in a new piece of piping. That is soon acted upon in the same way, however, aud the whole trouble comes agaiu. Pieces of iron piping are sent to the electrical bureau from small towns quite often which contaiu a dozen holes varying from oue-quarter to oue inch in diameter, the result of current passing through the points where the holes are located. A stand-pipe for the furnishing of water to an Illinois town was eaten so badly at the base by an electric current that it fell. Complaints are growing in number with the extension of electric street car lines using the earth for a return of current.—American Manufacturer.

In a paper read before the American Institute of Electrical Engineers by W. W. Griscom "On Some Storage Battery Phenomena," the author arrives at the following conclusions: 1. That the chemical reactions in a storage battery cell must be complex in order to acconnt for the curves of electromotive force, temperature and iuternal resistance. 2. That the current and the electromotive force of the compouent plates of a cell, and of each part of each plate, are constantly fluctuating, in spite of the fact that uo source of electricity can compare with a storage battery for steadiness and constancy. 3. That by reducing the normal output of a battery by about thirty or forty per cent the discharge can be mainly confined to one set of chemical reactions, thus prolouging the life of the battery. 4. That the uegative and positive plates are apt to get out of step, therefore the battery should be giveu an occasional overcharge when necessary, but only when necessary to get them in liue again.

It is considered that the electrolytic experiments made last season in connection with the manufacture of beetroot sugar were sufficiently successful to warrant their reuewal this year. Besides the experiments at French factories, some thirty-three German firms tried various electrolytic processes. The preseuce of one part of salt prevents the crystallization of four parts of sngar, and the idea of certain electrolytic processes is that by means of electrolytic osmosis the saline constitnents of the juices may be effectively climinated.

An electrical instrument, known as the "Essick page printer," was recently exhibited at work in Philadelphia. This instrument combines a transmitter in the shape of the keyboard of a typewriter and a receiver which works automatically. Pressnre on a letter on the keyboard reproduces the letter on paper in the receiver, and the operator can transmit a message to auy number of receivers at different points at the same time. The receiver is said to print the message rapidly and distinctly.

Practical Information.

THE city water works at Sault Ste. Marie, Mich., will be operated by electricity instead of steam as soon as the change can be made.

THE Minneapolis General Electric Company, Minneapolis, Minn., intend erecting a new power station at an estimated cost of $200,000.

AN important electric project which has been mooted in India contemplates the use of a stream where 3,000,000 cubic feet make a clear drop of 200 feet. Twelve turbines of 1000-horse power each will be used, and a transmission line 110 miles long will be required. The current is to be utilized for power for cotton and other mills, machine shops, pumping, working cranes and elevators, hauling canal boats, street cars, as well as for lighting and other purposes.

ALUMINUM is said to possess the property of leaving a mark on glass or other substances with silicious base, when drawn over them. The marks thus made cannot be removed by friction or washing, and designs can be drawn almost as readily on glass with an aluminum point as on paper with a lead pencil. Magnesium has also the same property, and in an even more marked degree, but being readily oxidizable, the mark soon fades away. Both metals also mark quartz, emeralds and topaz, but do not affect the diamond.

THE extended use of hydraulic lifts is causing increased attention to economy in their working. Formerly, no attempt was made to reduce the expenditure of power with light loads, but now balance cylinders with two sizes of the rams are being employed, the pressure water being admitted to one or both cylinders, according to the weight to be raised. A passenger lift of this kind, lately erected by Mr. Stannah, 20 Southwalk Bridgeroad, London, has given very economical results, which have also been obtained by a lift at Messrs. Hollington's, in Middlesex street, Whitechapel.

IN order to satisfy scientific men as to the real cause of Professor Helmholtz's death, a post mortem examination was made of the body at the desire of his relatives. As a consequence of the paralytic strokes the left portion of the brain was considerably softened, whilst the right portion was perfectly normal and sound. The brain displayed unusually numerous cerebral sinuations, such as are generally observed in the brains of persons of very great intellect. The physicians and pathologists who conducted the examination were extremely interested with what they saw and a cast of the brain was immediately taken.

IT would appear that it is now possible to supply through the national weather service, climatological information for almost every county in the United States. Nearly every county in the country is provided with a station equipped with instruments of the government standards. More than 10,000 crop correspondents are, it appears, at present co-operating with the national weather service through the State organizations; 3000 voluntary observers are furnishing monthly reports of daily observations of temperature and rainfall; and over 11,000 persons assist in the work of distributing the forecasts of the national weather service.

IT is announced that an exhibition of petroleum motors will take place at Berlin next June. The chief points of the programme issued by the special committee of the union of German mechanical engineers are: 1—Those motors only are to be admitted which work with petroleum of at least 0.80 specific weight (which excludes benzine and other motors). 2—The motors will be tried in May, and the exact results will be communicated to the exhibitors and published. 3—The trials will be made as regards power developed, smoothness and ease of working and handling, accessibility, simplicity, and solidity of construction, price, lubrication, safety, etc.

THE new German war balloon is, according to all accounts, a "fearful looking thing." The German, like the French, war balloons have almost double the lifting capacity of the English. Relatively, however, the materials employed at home upon the war balloons are described as both better and lighter and transport is not so burdened by them. At the same time, the greater lifting power of the captive foreign aerostat looks like an advantage, for they can ascend when strong winds are blowing and to higher altitudes, it is said, than the English at Chatham or Alnershot. To facilitate taking observations, the car is hung a great distance below the balloon, sometimes as much as forty feet.

IT is not claimed, says the *Electrical Review*, that the well-known Weymersch battery, with a fluid which costs less than that of Coad, could produce B. T. unit under an average of about 2s. The Velvo-carbon element is still more expensive in its output, and yet it is coolly claimed for the Coad cell that a fifty-candle power lamp can be run for ten hours. It is perfectly well known, adds our contemporary, that electrical energy produced by a dynamo is at least twenty times less costly than the same taken from a battery using zinc as the oxidizable metal. It is also quite certain that light for light, electricity, even from the dynamo, is dearer than gas, yet the Coad secret fluid is said to enable consumers to get their lights of equal power at one-fourth the price of gas!

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

Mining Share Market.

SAN FRANCISCO, Oct. 25, 1894.

The stock market has shown a little firmer toue toward the close of the week than was the case for several days previous. There have, bowever, heen no very important changes iu Comstock prices. On Saturday last a false dispatch was sent concerning a lack of ore helow the 1700 level of the Con. California & Virginia. This attempt to wreck the market is to be investigated by a committee of the S. F. Stock Exchange.

The average battery assay of the Consolidated California & Virginia ore worked at the Morgan mill last week, as officially reported by Mr. Lyman, was $82.32 per ton. This is the highest battery average from any Comstock mine since the old bouanza times.

The annual meeting of the stockholders of the Comstock Tnnnel Compauy was held in New York last week. There were represented 1,340,000 shares. An opposition to Theodore Sutro took the shape of a rival ticket, hut a compromise was effected hy which hoth sides elected some of their men to the Board of Directors. The following hoard was elected: Theodore Sutro, Otto Lowengarde, Elisha Dyer Jr., Julius A. Strugsberg, Maurice L. Muhleman, J. E. Knap and H. H. Smith. The following officers were then elected: President, Theodore Sutro; vice-president, Elisha Dyer Jr., and secretary and treasurer, Maurice L. Muhleman. The treasurer's statement showed that the halance on hand Septemher 1, 1894, was $16,418; the operating expenses during the past year were $36,202, and there was a deficiency of $21,483. Against the deficiency is a surplus fund of ahout $19,000. The honded indehtedness of the company is $1,908,000, the floating indebtedness $6163, and the stated assets $6,481,582.

The following illustrates the changes of the week:

A Balky Horse.

A balky horse is incorrigible under the treatmeut of the ordinary "horseman." In a case reported recently, after all the infallible methods had been tried without success, an ardent admirer of the noble animal and a lifelong student of his peculiarities, in his usual kindly manner, requested the driver to get a stone aud hammer on the bottom of a forefoot. Having hunted a stone he raised the foot of the "incorrigible" and gave it several taps on the iron shoe. "Drive a few more nails," and again the driver hammered the bottom of the hoof with the stone. "That will do; put down the foot and lead away your horse. This crowd has been wasting time long enough." The driver put down the foot, took hold of the bridle, and gave the starting signal. The horse responded willingly, pulling the load up the hill as steadily as if the balking instinct to it was unknown. The crowd cheered and dispersed. "What is the philosophy of that?" asked a delighted spectator. "Mental diversion, and I have never known it to fail," replied the amiable gentleman.—Canadiau Breeder.

Paper-Bound Fly Wheels.

The reinforcement of fly-wheel rims by binding their peripheries with wire is no novelty in Europe, several of these wire-bound wheels being iu use in Englaud. Latterly, however, the suggestion has been made in this country to use wood fly wheels covered with paper. The wooden skeleton of the big wheel is put in a revolving frame, and sheets of manilla paper wouud around it, with applications of glue between. About a hundred layers are wound on, and as the work is not costly, a cheaply made wheel results. Several wooden fly wheels are in use in the Uuited States, but so far as we know uone have yet been paper bound. Where large, light and inexpensive fly wheels are required, the suggestion seems to be worthy of consideration.

THE Honorable Gardiuer G. Hubbard, president of the National Geographical Society of Washington, D. C., is on his way to the Pacific coast for a brief visit. During his stay he will read an original paper before the Geographical Society of the Pacific on Japan aud China. Mr. Hubbard is well known iu Eastern scientific circles, aud was selected to preside at the International Congress of Geographers, held at the World's Fair in Chicago, which was attended by delegates from all parts of Europe. His paper will undoubtedly prove interesting at a time when all Christeudom is watching events in the Orient.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCTOBER 16, 1894.

527,656.—SEPARATOR—J. E. Borchard, New Jerusalem, Cal.

527,659.—BALL BEARING—J. S. Brown, Eureka, Cal.

527,492.—TREE SUPPORT—L. W. Higu, San Jose, Cal.

527,758.—FACE BATH—Harriet H. Hoge, Portland, Or.

527,756.—TRACK CLEARER—Mathews & Doyle, Pendleton, Or.

527,707.—PUMP—M. & J. N. McClay, Phœnix. A. T.

527,620.—STAMP MILL—J. M. McFarland, Colton, Cal.

527,504.—PRACTICE PIANO—W. O. Nisley, Portland, Or.

527,445.—WINDOW PLATFORM—G. W. Ousley, Jr., San Jose, Cal.

527,507.—WASHING MACHINE—C. P. Randolph, Los Angeles, Cal.

527,624.—STEAM BOILER—E. Shydecker, San Jose, Cal.

527,563.—POWDER—E. A. Starke, S. F.

527,636.—DISINTEGRATOR—Frank Walker, S. F.

527,570.—SNAP HOOK—F. & I. F. White, Pomona, Cal.

23,700.—DESIGN—D. C. Wilgus, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ORE CONCENTRATOR.—A. C. Springer, of Seattle, Wash. No. 527,323. Dated Oct. 9, 1894. This concentrator is of the endless traveling belt type, and the invention relates particularly to the construetion of the helt of the concentrator, whereby that type of helt, in which the snrface is divided into a number of parallel runs, is improved. These belts are known as sluiced belts aud the improvements of this patent have for their object the provision of a concentrator in which, by reason of the construction of the helt and of the drums and rollers upon which it is mounted, the helt will travel straight and true, and will be held in position under all circumstances of its operation. These objects are attained by attaching ropes to the belt (which is composed of canvas or other fahric) in sucb a manner that each rope projects from each surface of the helt, forming ribs or ridges both outside aud in, and in having drums and rollers provided with grooves in which these ribs engage to guide the belt.

CHILD'S CARRIAGE.—John W. Jaimison, Vallejo, Cal. No. 526,972. Dated Oct. 2, 1894. The object of this invention is to provide a child's carriage, so constructed that when not in use it may be folded up iuto a compact form for storage and for transportation when it is necessary to travel for some distance before a place is reached where the carriage can be used. It consists of side hars having wheels journaled upon the opposite ends and joints intermediate within the ends, with slides adapted to slip over the joints and be locked thereon; diagonal braces extending between the two side frames; a bed frame consisting of side and end hars jointed together and clasps by which they are attached to springs which support them from the side hars of the wheel frame; a means for supporting a flexible containing sack which, when folded, becomes the hed of the frame; also a pillow and a removable handle, with means for attaching it to the frame. The sack which forms the bed and pillow when the carriage is in use, serves to contain all the parts when they are dismounted for transportation.

RAILWAY JOINT BRIDGE.—Charles C. Wells, San Francisco. No. 526,954. Dated Oct. 2, 1894. The object of this invention is especially to relieve the jar caused by the pounding of the wheels when the cars cross the joints formed hy the meetiug ends of street or other railway rails, and to cause an essentially smooth passage of the wheels over these joints, thus enahling the rails to be placed with the meeting ends at any point desirable, to rest upon the yokes which form the cable tunnels of cable roads or at any point where they may happen to ahut. It consists of a rectangular bridge har, having the upper side made convex, the lower portion of the ends and the lower edges rounded; a single elongated slot in each end; opened, correspondingly shaped channels in the top of each rail end into which the bridge har loosely fits, with its central, convex portion slightly above the surfaces of the rail ends; a bolt passing transversely through a single slot in each rail end, and a corresponding slot in each end of the har so as to form a loosely hinged and movahle joint.

BASIN TRAP.—John Marquis, San Francisco. No. 526,666. Dated Sept. 25, 1894. The object of this invention is to provide an attachment for wash-hasins which combines in itself a trap and overflow attachment, and a jet attachment whereby the basin is discharged through the overflow aud without any other connection with the discharge passage. It consists of an overflow siphon jet discharge having its upper bend above the level of the bottom of the basin, its outer end connected with the outlet below the bottom of the hasin, its inner end connecting with and forming a trap through which and the overflow pipe the contents of the basiu are discharged, and a jet tuhe in the receiving end of the disehage passage adapted to dischargo upwardly by direct impulse upon the water iu the short arm of the passage, whereby this water is set in motiou hy the impulse from below, aud a means for adjusting the jet and regulating its position.

SNAP HOOK.—Frank White and Ira F. White, Pomona, Cal. No. 527,570. Dated Oct. 16, 1894. This hook belongs to that general class of snaps in which the hook head is guarded by means of a spring-controlled sliding bolt seated in the harrel or hody of the device. The hook consists of a blank adapted to be bent iuto shape, having a front portion to form the hook head and nose thereof, a rear portion to form the lugs for the end of the loop, and an iutervening body portion tbe side portions of which are cut out to form au elongated slot in the hack of the body, and having also a recess in its back central portion as an outlet for sand, a slidable holt to be seated in said barrel, having a knob with beveled under portions to project through the slot formed hy the cut outside of the body portiou, and a loop or eye on the rear extremity of the harrel portion.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Messrs. J. S. Gould and F. M. Spencer in the Holloway mine, near Gibsonville, Plumas Co., Cal., and to impound tailings behind log and brush dam in a ravine below the mine; from W. A. Morse in the Mugginsville mine, near Eureka North, Sierra Co., to impound tailings behind a crib dam in Eureka creek; and from John R. Jones in the Wankshaw mine, near Relief Hill, Nevada Co., to impound tailings behind rock dam in Logan canyon, gives notice that a meeting will be held at Room 62, Flood building, San Francisco, Cal., on October 29th, 1894, at 1:30 P. M.

Gold Quartz Mine For Sale.
MILLING PROPOSITION.

No money down. A 20-stamp mill must be erected and mine can be paid for out of product of bullion. The property consists of two claims 1500x600 each. Width of ledge, 1½ foot to 4 feet. Ore runs from $10 to $20 per ton. $75,000 estimated in sight. Two tunnels run in on vein for some distance. Price, $30,000. This is a snap. Owner can he seen in San Francisco.
Further particnlars, reports, etc., can be had of
J. F. CROSETT, 628 Sacramento Street,
SAN FRANCISCO, CAL.

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.
Price $6.00 postpaid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.
By J. S. PHILLIPS. M. E.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

FOR SALE.
Two Mines of Free Milling Gold Ore.
For particnlars address JAMES A. SCOTT, Reno, Nevada.

INVENTORS, Take Notice!
L. PETERSON, MODEL MAKER,
226 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential*.

Coast Industrial Notes.

—The Santa Maria *Times* predicts that the next industry for that place will be a beet sugar factory.

—The Mount Shasta box factory at Sisson, Shasta Co., was almost totally destroyed by fire on the 17th inst. The loss was $10,000.

Work on the electric plant which is to furnish light for Angels, Calaveras Co., is being vigorously prosecuted. The plant will be established in the canyon two miles above Murphys. This splendid enterprise is the work of the Utica Mining Co.

—The Anaconda smelters use up 80,000 fire brick every month. The brick are manufactured in Anaconda. The fire clay comes from Three Forks, Jefferson county, and the silica rock from Beaverhead county. One hundred and sixty men are employed at the brick works.

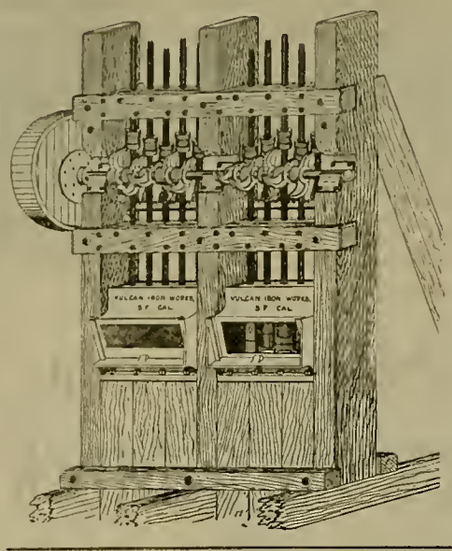
—It is very depressing to make a tour of the outlying districts surrounding Butte, Montana, and see the dilapidated condition of many of the hoists on mines which, when silver was at a fair price, were dividend-payers, says the *Inter-Mountain*. Now these hoists are tenanted by bats and owls, the doors and windows are broken, and everything is falling into decay.

—The sawmill at Pokegama is to be started up again this week, as a large supply of saw logs is now coming down the river. The mill is also fitted up with electric lights to permit working full ten hours every day, as the daylight shortens up during the coming winter. The box factory, which uses up most of the lumber sawed by the mill, is kept steadily in operation every day, making better times at that flourishing town on the banks of the Klamath river at the C. & O. R. R. crossing.—New Northwest.

—Another petition has been presented to the Board of Trustees of Grass Valley from James D. Hagae, asking the right of way to lay down and maintain a pipe line for conducting water and also erect and maintain poles and wires for conducting electric power from a point on the Empire road where the same crosses the east boundary of the town site of Grass Valley, and running thence along Empire street to Boston ravine and the west line of the townsite of South Grass Valley, the right to continue twenty-five years, under restrictions of the board.

The decision of Judge McKenna will permit the work designed by James G. Fair to go on at North Beach, west of Fort Mason. The filling in of water lots to the line of Lewis street will begin. Piles have been driven along the street and the space to the land will be filled in with sand. A great deal of work has been done, pending this decision, in filling in the marshes—indeed, this is nearly completed. It is the intention of Senator Fair to give long leases and induce the building of factories and manufacturing plants there. For instance, the Fulton Iron Works has built out there on the only available point at present, and as other points become available other factories will be erected. In all sixty-two blocks of land are to be filled in, and where the line of piles extends at present there will be a costly seawall of masonry. Money is not to be spared on the project. Work on the seawall will be begun at once. About 500 men will be given steady work.

Mining Machinery.



STAMP BATTERIES.

Corliss and Meyer Cut-off
Steam Engines.
—Improved—
Blake Rock Breakers.
Amalgamating Pans
and Settlers.
CHLORINATION BARRELS.
BRUCKNER ROASTING CYLINDERS.

FRANCIS SMITH & CO.,
—MANUFACTURERS OF—
SHEET IRON & STEEL PIPE
FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.
130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

Adamantine Shoes and Dies
—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

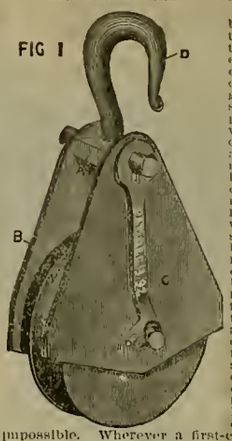
These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 220 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill Supplies.

Stamp Cam.

IMPROVED STEEL SNATCH BLOCK.



This is admitted by experts to be the best block of the kind in existence. Being made of the best quality of refined steel, it gives greater strength in proportion to its weight, and the opening side being a solid piece, does not detract from its strength as in other blocks. In using wire cable, the damage to which the cable is subject in other blocks by jamming between the cheek plate of the block and rim of the pulley is entirely overcome, as the guiding ribs B, as shown in the cut, are snugly filled to the inner surface of the cheek plates and completely cover the rim of the pulley, making accidents of this kind impossible. Wherever a first-class block is required, it is superior to any other. *Catalogues sent free.* Address, CALIFORNIA STUMP PULLER CO., 82-84 Zoe Street, San Francisco, Cal.

Krogh M'f'g Co.,
MANUFACTURERS OF
Mining Pumps, Pan Staves, Leaching Tanks
and also the famous

Krogh Mining Hoist!

The best and cheapest on the market, and for strength and durability unsurpassed.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

GLADSTONE MINING COMPANY, FRENCH GULCH, Shasta Co., Cal.,
C. J. Clark, M. E., Gen'l, Supt. Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to to mention. In order to give an idea of the work they are doing here, I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

HAVE YOU A MINE? If so do not fail to see Parke & Lacy Co.'s Stock of MINING MACHINERY

AND PACIFIC ELECTRICAL REVIEW.

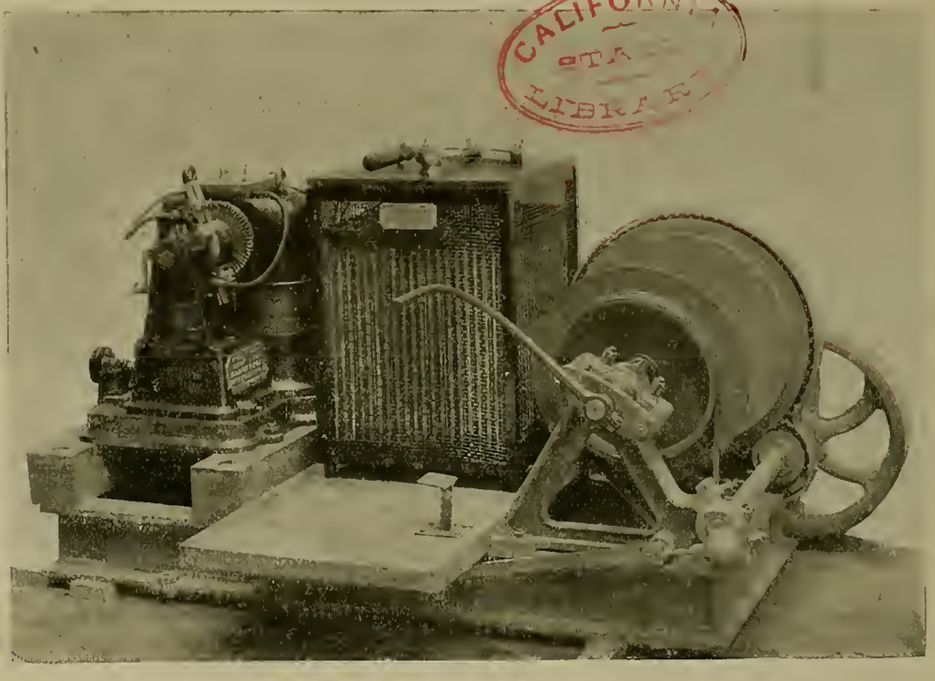
VOLUME LXIX. Number 18. SAN FRANCISCO, SATURDAY, NOVEMBER 3, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

CALIFORNIA STATE LIBRARY

Electrical Hoist.

The accompanying cut represents a latest improved electric mining hoist, built for the Phœnix mine of Sierra county, Cal., by the Electrical Engineering Co. of 34 and 36 Main street.

The hoist is double reduction by belt and gear. The first reduction is by belt from motor to pulley on countershaft of hoist and the second reduction by gear from small pinion of countershaft to pinion on drum. This combination relieves the motor of all jars and vibration which would be communicated without the interposition of the belt. As will be seen from the cut, the arrangement is very compact and occupies but small space, and in this respect is especially suitable to underground work. This hoist is to be placed 700 feet underground where it is to work on the tunnel at the mouth of an incline.

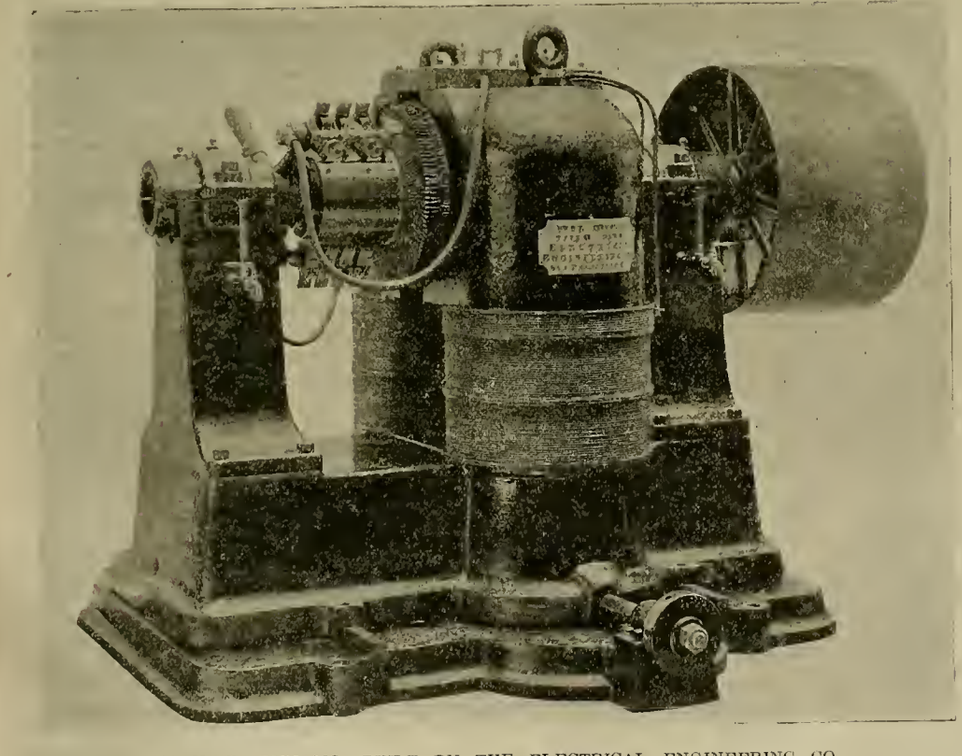


ELECTRIC HOIST, BUILT BY THE ELECTRICAL ENGINEERING CO.

One Hundred and Fifty H. P. Dynamo.

This cut represents a 150 H. P. electric dynamo recently built by the Electrical Engineering Co. for the Gold Valley Mining Co. of Sierra county. Two 70 H. P. motors also accompany the plant. The transmission is 4000 feet. One motor operates a 30-stamp mill and the other a double hoist. The dynamo and motors are of the company's latest "C" type, made specially for mining transmission.

An interesting feature of the boom in gold mining is that only a small portion of the boom relates to alleged discoveries of new mines. Well-known old mines with good bodies of low-grade gold ore are attracting the attention of mining men. For years such properties were allowed to lie idle, but why, it is difficult to say, inasmuch as electric power transmission has been a certainty and actually been on the market for the past half dozen years. We are told by the Electrical Engineering Co. that of the four mines which it has contracted to equip with electric machinery within the past sixty days, they are all old mines which it would not pay to work with steam power. There are still many such properties waiting to be rehabilitated and equipped with electric machinery, whereby they may be worked economically, and even if no new discoveries are made, California has enough of this sort of property to hold up a substantial boom for years to come.



150 H. P. DYNAMO, BUILT BY THE ELECTRICAL ENGINEERING CO.

TREES blazed and squared, rock monuments and the prospect hole are permanent objects, within the meaning of the statutes requiring the notice of the location of a mining claim to describe the same by reference to some natural or permanent monument. The fact that the calls in such a notice mention stakes when in fact the monuments are trees cut off three feet from the ground, and blazed and squared, is immaterial. The fact that the location of a mining claim, as marked on the ground, is 300 feet too long and 50 feet too wide—the statute providing that a claim may be located 1500 feet by 600 feet—does not render the location void, where the excess was included through mistake and in good faith, and the notice posted on the claim stated that only an area of 1500 feet by 600 feet was claimed, and gave the point of beginning and direction of the boundary lines.—Hanson vs. Fletcher, 37 Pacific Reports 480—Supreme Court of Utah.

THESE interesting figures are given by the Bureau of Statistics in Berlin. Of the steam engines now working in the world four-fifths have been constructed during the last twenty-five years. France has 79,590 stationary and locomotive boilers, 1850 boat boilers and 7000 locomotives; Germany, 59,000 land boilers, 1700 ship boilers and 10,000 locomotives; Austria, 12,000 boilers and 2800 locomotives. The working steam engines of the United States represent 7,500,000-horse power, of England 7,000,000-horse power, Germany 4,500,000-horse power, France 3,000,000-horse power, Austria 1,500,000-horse power. This estimate does not include the locomotives, whose number in the world is 105,000.

MINING AND SCIENTIFIC PRESS.

Office, No. 220 Market Street, Northeast Corner Front, San Francisco.
Take the Elevator, No. 12 Front Street.

Terms of Subscription.

Annual Subscription, $3. New Subscriptions will be declined without cash in advance. All arrearages must be paid for at the rate of $3.50 per annum.

Advertising Rates.

	1 Week.	1 Month.	3 Months.	1 Year.
Per Line (agate)	$ .25	$ .50	$ 1.20	$ 4.00
Half-Inch (1 square)	1.00	2.50	6.50	22.00
One Inch	1.50	5.00	13.00	42.00

MINING NOTICES.

Assessment Notices.....$10.00
Delinquent Notices, per square..... 3.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type, or in particular parts of the paper, at special rates. Four insertions are rated in a month.

Our latest forms go to press on Thursday evening.

Entered at the S. F. Postoffice as second-class mail matter.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Electric Hoist, Built by the Electrical Engineering Co.; One Hundred and Fifty H. P. Dynamo, Built by the Electrical Engineering Co., 273. The War Ship Oregon Under Way; U. S. War Ship for Harbor Defense, Monterey, 277.

EDITORIALS.—Electrical Hoist; One Hundred and Fifty H. P. Dynamo; Miscellaneous, 273. California Built War Ships, 277. Congress and the Hydraulic Mines; Mineral Lands and Railroads; Miscellaneous, 274. Injurious to the Mining Industry of California, 275.

CORRESPONDENCE.—Shasta County Mines; The Tule Canyon Gold, 279.

SCIENTIFIC PROGRESS.—Aids in the Determination of Color Blindness; Electric Registering of Chemical Action; Magnetic Properties of Asbestos; Germ Life in Ocean Depths, 280.

MECHANICAL PROGRESS.—Electricity for Motive Power Purposes; Soldering Glass to Metals; Steam Carriages; The Essential Ideas of Most Foreign Rifles of American Origin, 281.

ELECTRICAL PROGRESS.—Interesting Electric Welding; Cost of Street Cars; Miscellaneous, 284.

PRACTICAL INFORMATION.—Japanese Lacquer; Digestibility of Foods; An Illustration of Power; Curiosities About Wood, 285.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 282-283.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 287.

MISCELLANEOUS.—Concentrates, 275. The Storage Battery from the Standpoint of the Purchaser; Business Revival in the Black Hills; Tuolumne County Gold Mines; Prospecting, 276. Mining in Hard Times, 277. Cyanide Processes on the Randt; Fuels in the United States; The Day of Small Things, 278. The Effect of Heat on Tool Steel; Working Phosphate Deposits, 279. Flying Machines; The Velocity of Express Trains, 281. Recent Patents; Industrial Notes, 287.

THERE is an unusual quantity of gold coming into the local mint of late, indicating prosperity among the miners.

THERE are twenty-five or thirty applications for license to mine by hydraulic process pending before the California Debris Commission.

LEADVILLE, COL., the great silver camp of the country, has now turned itself into a gold camp, there being little demand for silver properties.

THE Executive Committee of the California Miners' Association intend inviting the California Senators and Congressmen to be present at the State Convention on the 19th inst.

THERE is a very good and brisk demand for gold-mining properties in California at the present time, and many people are looking out for mines to purchase. The only difficulty is they want developed claims which are paying or about ready to pay, and these the miners want good prices for. A good many people in search of mines want developed ones at the price of prospects. If they would only take hold of the prospects and develop them, we would have a dozen paying mines where there is now one.

COLORADO, now that its silver mines do not pay, is very industriously and extensively advertising its gold mines, and one would think to read some of the Colorado papers that no gold worth speaking of was being mined elsewhere. Yet California makes an annual output of gold exceeding that of Colorado by several millions. Some Colorado gold mining companies are even advertising their stock for sale in California newspapers. We do not advertise gold mining shares for sale in this State nor do much publishing of mining prospectuses in the newspapers, but the Colorado people believe in setting their best foot forward and letting others know what they have. They attract abundant capital in their direction from outside regions. California as a whole is rather apathetic in this respect, and the miners have to do their own "hustling." The gold-mining industry is not properly appreciated by the people of California, and receives little or no encouragement from the State itself or from the people generally. There is no doubt, however, that gold mining is the foremost and most profitable industry of California to-day.

Congress and the Hydraulic Mines.

The candidates for Congress in the districts of this State, where the mining debris question formerly affected opposing interests, are having a warm campaign, and are very anxious for the miners' votes. One bases his "fight" on what he has done for the miner and another on what he will do for him.

It is our opinion that there is very little use on either side reopening this controversy, which kept both sides in litigation for many years. The so-called Caminetti law has only been in operation about a year, and there is very little chance of Congress making any changes until it is proven either a failure or a success. Like any law which could be framed, this one is not entirely satisfactory to either party of the controversy, but it is very much better than none at all, and as good as could be expected under the circumstances.

Before it was passed there were practically no hydraulic mines in the drainage basin of the Sacramento and San Joaquin rivers which could be legally operated. Since its passage some fifty mines have been permitted to resume operations, and about twenty-five or thirty more have made application for license. The mines which are working are doing so without injury to the rivers or farming lands, so the anti-debris people have nothing to complain of. If there are others working illegally they have the same redress as formerly and can stop them.

We do not believe that either an old member of Congress sent back again or a new one put in his place will be able to convince Congress that this law should be modified or in any way changed until it has had a longer continued trial.

Now, it is our opinion that neither the miner nor farmer has anything to gain by asking for changes at the present stage. Mines are working and rivers are running clear—the two points asked for by both parties. True, the mines cannot work to full capacity and they must spend money for restraining works, but this is better than not being able to work at all. True, also, that professional anti-debris agitators and spies are out of a job and a Government Commission controls hydraulic mining in California instead of an irresponsible, unofficial organization.

But these little things the general public can bear with equanimity. The miners are reopening their mines, and though some of them grumble at the restrictions under which they are placed, working under restrictions is better altogether than closing down under injunctions.

The farmers have no cause of complaint whatever. The Government Commission is taking mighty good care of the rivers. It was not appointed, as some rabid anti-debris people hoped it would be, to stop hydraulic mining, but to regulate it. It is its duty to give the miners a license to mine if this can be done without injuring the streams, and it keeps pretty close watch on operations subsequent to the issuance of the license, as well as making careful investigation previous thereto.

Altogether, the Camiuetti law is doing all that was expected of it and as much as any reasonable man hoped for. The starting up of forty or fifty important producing hydraulic properties, idle for years previous, shows what it has done for the miners; and the fact that these are capable of being worked while keeping their debris out of the rivers, shows that the farmers' point is gained, too.

They were supposed never to pretend that the mines should be stopped. They only wanted the ever-increasing flood of debris stopped. Now this has been done, they ought to be satisfied.

If Congress can be brought to do anything further it will not be in changing this law, but in making appropriations for the improvement of our navigable streams on a comprehensive plan which will prevent the debris already in them from coming farther down. We are not among those who believe Congress can ever be convinced it should construct public works for private profit. We do not believe that, if the Government builds dams on the rivers, the miners will be allowed to indiscriminately dump debris from the mines behind them, notwithstanding the specious arguments of rival candidates for Congressional honors.

Naturally, the miners will want men to represent their districts in Congress who are friendly to their interest, but the farmers want a man on their side, too. It so happens that the mountain and valley counties, where this question is important, have only one representative, and he has the responsibility of looking after the interests of both. It does not appear to us, however, that there will be any radical changes in the present laws, or any changes at all, for some years to come, no matter who is elected from the district referred to.

Mineral Lands and Railroads.

The following paragraph from the *Democrat-Times*, Jacksonville, Oregon, emphasizes our remarks of last week on the subject of railroad selections of mineral lands:

> The list of lands advertised by the Roseburg Land Office and claimed by the O. & C. R. R. Co. embraces a large mineral area in Josephine as well as in Jackson county. A large portion of the mining ground along Coyote, Grave and Louse creeks, and Jump-off-Joe is included in the list; also the Dry Diggings section, east of Grant's Pass. Parties having unpatented mining claims should look the matter up.

It will be seen from this that the warning given in the PRESS of last week came none too soon and that miners in all sections should at once begin to look up the exact geographical location of their properties, so as to be posted as to their position in township and section.

It will not do to be careless or neglect this matter or the mine owner will find his claim covered by agricultural patent to the railroad company. It will be necessary to look out that the lists of lands advertised do not cover mining ground. The difficulty is that these legal advertisements, giving township, range and section, are full of a lot of confusing figures, and not very interesting reading. But if the miners in the different sections do not read them, to see if their particular sections are named, they will be apt to lose their claims unless they file the required protests at once.

The railroads can, by the means adopted, get hold of this mining ground by a perfectly legal process, and after their patents are obtained there is no redress. The fact that a man has properly located his claim and had a possessory title for years makes no difference, unless he has a patent. It is his duty to file a protest in the proper Land Office when the ground in question is advertised. The newspapers in the various mining sections should all note this fact and warn the miners of the danger there is of claims being lost unless the necessary precautions are taken.

E. G. WAITE, Secretary of State of California, died in Alameda on Tuesday, after a very short illness. Mr. Waite was an old-time miner of the early days of California, and has always been a friend of the mining industry. He has been a writer for the press for many years as an editor and correspondent, and has held several important political positions. As early as 1855 he was associated with Nat P. Brown and A. A. Sargent in the publication of the Nevada *Journal*, in Nevada county, and in 1861 he was associated with Mr. Brown in the publication of the *Transcript* in the same county. He was at one time assistant editor of the Sacramento *Union*, and also of the San Francisco *Times*. During the life of the *Mining and Industrial Advocate* in this city he was its editor and an ardent supporter of the hydraulic mining industry, which that paper tried hard to revive. This was some years ago, during the period when hydraulic mining was entirely under the ban. Mr. Waite was a man of strict integrity and was held in great esteem by all who knew him.

THE MINERS, in common with other citizens of the State, have been so interested in politics of late that they have not probably given much consideration to the coming convention to be held in this city on the 19th inst. Next week the political crisis will have passed and time can be given to other matters which claim attention. The branch miners' associations in the interior counties which have not already held local conventions, should meet at once and elect delegates to the State convention, as has been pointed out in previous issues of the PRESS. There are many important questions to be considered, and those who come as delegates should be prepared to discuss them. It is expected that there will be quite a large attendance this year, and the quartz-mining interests should be specially well represented.

Injurious to the Mining Industry of California.

An effort is being made to sell on the French market the stock of the La Grange hydraulic mines of Trinity county, California, at the enormous price of 25,000,000 francs, or $5,000,000. The very thought of such a scheme fairly takes away the breath of the honest California miner, and such emphatic expressions of condemnation are heard on all sides that we feel justified in voicing the sentiment of the general mining public here in denouncing this enterprise and warning investors to investigate the property of the company before gambling on such a reckless proposition. The mine is worth no such money and never was or will be, and those who expect dividends on such a basis of valuation will be greatly disappointed.

The La Grange mine, formerly the Ward, or as it was more commonly known in Trinity county, the Loveridge mine, is situated on Oregon mountain, midway between Weaverville and Junction City. A year or so ago a mining operator named Beaudry, formerly of Denver, Col., secured a bond on the property and succeeded in forming a company composed of himself and wife, Baron La Grange and wife—after whom the mine was named—and two Denver gentlemen, Messrs. Bailey and Gelder. The company was incorporated under the laws of Colorado with $5,000,000 capital stock, or 5,000,000 shares of $1 each, and this is what they are trying to sell in Paris.

If there was a "ghost of a show" for the purchasers to realize on their stock no harm would be done, but in such a capitalization as this there is not, in our opinion, the faintest chance. The fact of the matter is, the mine has never paid expenses, although it was always called rich. This statement can easily be established by the fact that the property was hopelessly mortgaged to Mr. Henry Lorenz of Weaverville at the time of the purchase by Beaudry *et al.* There were a dozen or more uncancelled mortages to the same man.

Some two years ago the editor of this paper, in company with a mining engineer, was inspecting some mines in Trinity county and visited this property casually. It has been worked many years, but not in a very careful or systematic manner. In fact, operations were so conducted that it was impossible to make any kind of a proper cleanup. The gravel is full of boulders, which are expensive to handle. While other gravel mines around Weaverville and Junction City were making money this one was not, though, as stated, it had the reputation of being a very rich mine.

If under private ownership the mine could not keep out of debt, much less pay dividends, how can the poor Frenchmen be expected to reap a harvest on the basis of $5,000,000 capital stock? It is true that since the purchase the La Grange Company have built a new ditch at a cost of $110,000 and increased the water supply, but even with that they only claim to have taken out $40,000 the past year, though common report puts the amount at $18,000.

People of experience who want to buy gravel mining properties expect an annual return of twenty per cent on purchase price. On this basis, at the price asked for the stock, the mine ought to yield $1,000,000 a year. But it will not pay two per cent, or $100,000 a year, much less twenty per cent. In fact, if it pays one-quarter or one-half of one per cent net on the capital stock it will be doing better than the miners of Trinity county expect.

The price asked for this mine exceeds that of the value of any gold mine in California except the Utica mine of Calaveras county. The Kennedy mine of Amador county could probably be bought for two and a half millions of dollars, yet it pays $40,000 a month in dividends, and paid dividends of $480,000 in 1893.

If common report be true the original price paid for the La Grange mine by Beaudry *et al.* was $250,000 (less commissions). The new ditch cost $110,000, so the total cost was $360,000. If it is now sold for $5,000,000 to the Frenchmen the promoters will reap a very handsome profit indeed. A reasonable increase over cost price would have attracted no attention, but this is unreasonable.

Trinity is one of the coming mining counties of California, having both good gravel and quartz mines, and can ill afford to have its prospects damaged by any "top heavy," over-capitalized mines. It is enterprises of this kind which really injure our chief industry, because if foreign investors do not realize on investments here, properties of real merit cannot be sold. The mining industry of California has before this been injured in Europe by similar enterprises. With care and prudence investments in our mines will bring good rewards, but not on any such basis as this. The famous—or infamous—Sucker Flat mine of Placer county, which was placed on the French market ten years ago, and was absolutely worthless, did a great deal of harm, which we have not yet overcome. The La Grange property has more merit than that had, for it is really a mine, and is being worked. Moreover, by good management it would doubtless pay a profit on a reasonable sum invested, but it is highly improbable that it will pay any decent return on such a basis of capitalization as that with which it is overloaded.

Concentrates.

THE Soda Works at Keeler have closed down for the present.

LEADVILLE'S gold output for the present year is now estimated at $3,000,000.

THE Texas mine at Central, N. M., has been leased and bonded for a large sum.

A NEW COMPANY will work the rich placers on the west fork of the Madison river, Montana.

IT is estimated that Cripple Creek is now shipping at the rate of 2000 carloads of ore per month.

THE people at Spokane are getting anxious for the Spokane smelter to smelt, which it has not done yet.

AT the Rawhide mine, Tuolumne county, wonderfully rich ore is being extracted below the 500-foot level.

THE App mine, at Quartz Mountain, Tuolumne county, reports having struck very rich ore on the 800 level.

THERE are several Kendall mills running on Gold creek, Granite Co., Montana, and they are all doing good work.

THE Water Canyon Arrastra Co. has been organized at Kennedy, Nev., by Bender, Sweitzer, Rilley, Faison and Borland.

GENERAL REPORTS from all over the State indicate renewed activity in mining operations, both in gravel and quartz properties.

THE Takon Cons. mine, Alaska, cleaned up $2500 in its last twenty-day run. The ore now on the dump is the best yet taken out.

THE ore output of the Trade Dollar mine, Silver City, Idaho, is getting ahead of the mill capacity, and several men have been laid off lately.

THE Harlan mine, near Davis Flat, on the north fork of the Tuolumne river, is being operated by the Scott Bros., and is turning out very good ore.

THE Houston copper mines, Houston, Idaho, have been leased by W. A. Clark & Co. of Butte, and will be worked by a large force this fall and winter.

THOUGH the Mercur Co., Utah, is under very heavy expenses constructing its new works, yet it paid its regular $25,000 dividend last month.

THE Iron Mountain mine, Shasta county, has not been sold as reported. The Shasta *Courier* says it is still being run by Messrs. Camden and Sallee.

CHARLES O. PARSONS, who was the first superintendent of the Boston & Montana smelter at Great Falls, died at Spokane last week from typhoid fever.

ORE receipts of the Denver smelters average 1231 tons per day, showing a gain of twenty-three per cent over the average during the first half of the year.

THE Treadwell mine, Alaska, is pounding away as usual with its 240 stamps, while the Mexican is running on a little better grade of ore with sixty stamps.

WITH two gold mills in full blast, the third in operation by the last of the month, and the fourth a certainty in a short time, Bingham is pre-eminently the gold camp of Utah.

THE Prospect Mining Company incorporates with a capital of $20,000, fully subscribed. Directors—Thomas B. Bishop, H. Dutard, A. Halsey, P. Van Clief, H. L. Gear and William F. Herrin.

IT is currently reported, says the Deadwood (Dakota) *Times*, that on the completion of the Golden Reward cyanide mill a considerable reduction will be made in the treatment charges for silicious ores.

THE Pawle mine, Tuolumne Co., is to be worked by a new corporation with the following directors: Edgar C. Sutliffe, Charles L. Tilden, Frank R. Whitcomb, James H. Deering, Jr., and Stephen R. O'Keefe.

THE Anita Gold Mining Company has incorporated with a capital of $10,000,000, of which $41,500 has been subscribed. Directors—F. Reichling, Daniel E. Hayes, John Barton, George Goodman and Willis E. Davis.

THERE are but few men left in the camp at Red Rock, Kern Co., the majority of them having gone to the excitement in the Black Hills, about fifteen miles north of Red Rock. The new camp is said to be very promising.

THE old Perschbacker mine at Magalia, Butte county, is to be operated by a new company with the following directors: N. D. Rideout, Norman Rideout, C. S. Brooks, Dunning Rideout of Marysville and J. B. Haggin of New York City.

THE Gold Blossom Gold Mining Company; principal place of business, San Francisco. Capital stock, $20,000. Directors—C. F. Reed of Auburn, F. A. Berlin, Emile Besson and T. J. Shackleford of San Francisco, and Hubert Bus of Oakland.

THE Black Hills country was the only section exempted from the act doing away with the necessary assessment work for 1894. The annual assessment work is well under way there, and the result is highly satisfactory, says the Black Hills *Times*. Many new and rich strikes have been made, and many new and producing mines will be added to the many now in operation.

A GOOD gold mine is the thing to possess. By possession it is a man's own and his neighbor does not come in competition when it is systematically worked. If it pays anything over and above the cost of working, the profit belongs to the owner.

THERE has been a great falling off in the number of voters in Storey county, Nev., where the Comstock lode is situated, since 1892, although not so much as had been estimated by many. In 1892 a total of 2403 voters registered. This year the number is 1886.

THE project of establishing reduction works for ores in Sacramento has again been revived. The plan is to put up machinery capable of handling ten tons per day, and buy outright the concentrates from Nevada and other mines, instead of reducing them on commission.

EXPERIENCED mining men assert that money ventured in prospecting or developing, as well as in working paying mines, offers surer promise of profitable returns than investments in agriculture, fruit growing, vine culture, or almost any other industry.—Denver Mining Record.

THE Kanaka Mining Company of Nevada county has elected the following board of directors: David Bryan, Wm. LeBar, Duncan Gillis, Wm. Dedman and T. J. Michell. The board organized by electing David Bryan, president; Wm. LeBar, vice-president; T. J. Michell, secretary, and Michell & Carson, treasurer.

AT the annual meeting of the King Solomon Mining Company of Nevada county, the following directors were elected: Elam Biggs, Jas. Ennor, Frank Ennor, Stephen L. Richards and J. A. Bunney. The board organized by electing Elam Biggs, president; J. A. Bunney, secretary, and the Citizens' Bank, treasurer.

IT is stated that Mr. John Hays Hammond, the young California mining engineer who has taken so prominent a position in South Africa, is fully satisfied with the richness and permanence of the ledges in the Matabeleland properties belonging to the Willoughby Syndicate and the Bechuanaland Exploration Co., and expresses his opinion that money can be safely invested in them.

SILVER CITY, Idaho, is quite prosperous. Everybody is busy, and that mountain town, surrounded by rich mines, is full of strangers. The Black Jack, Trade Dollar and Tip Top mills are all running, and more than a dozen mines are creating attention by the splendid showings they are making. Every visitor who comes to Silver City remarks that, compared with other places, the town shows wonderful prosperity.

A MINER who has been working in the Upper Yukon section, Alaska, around the headwaters of the Hootalinqua, and intends returning next season, says: "The gold belt running through California and north following the main range up through the Omineca, Carrihoo and Cassiar districts must cross the water-shed somewhere in that section, and the outlook for striking something is worth the venture."

THE Golden Reward Chlorination Works of Deadwood, Dakota, to further develop the country, are now prepared to take any of the refractory ores found on Yellow creek or any place in the Hills, and pay cash for them. McShane Bros. are already shipping ore to them and are receiving a clear $1000 net per car for their ore at the plant. They are shipping one car per day. The Golden Reward cyanide addition will be ready for operation in about two weeks. These are custom works and should greatly aid the prospectors and miners of that region.

DETROIT DISTRICT, Millard county, Utah, is showing up some good mines. As a sequence to recent discoveries, a large smelting plant has been established at Leamington, on the line of the Union Pacific Railroad and about forty-five miles distant from the mines owned by the constructors. This plant is most advantageously located, having a water power sufficient for works of any capacity, with, in the immediate neighborhood, immense quantities of lime, iron and fluxing ores for any probable future demand. Two stacks are being erected with a capacity of 100 tons per day.

THE Parrot Company has decided not to remove its smelting plant from Butte. The company had seriously entertained the belief at one time that a removal to another locality where water could be had in abundance would be beneficial to its interests, and experts during the past summer have been engaged in looking over various sites on the Jefferson and Big Hole rivers. The company, after mature consideration, however, decided that a change at the present time would be an ill-advised movement. Now that this is settled, preparations are being made for the extension of its smelting and concentrating plants.

THE Alaska mine, Pike City, Sierra county, has again changed hands, the stock having been bought by Dan Cole, Emil Gunzberger and G. H. and Oliver Sunderhaus. The mine is a very rich one. In working it now, it is proposed to make a new departure entirely by sinking another shaft at a point which will carry them in about 250 feet below the 400 level of the mine, the lowest workings in the property. This will permit the heavy flow of water to be handled to good advantage at a much less cost. It is also intended to put in an electric plant at the Yuba river, which will run all the machinery. A great save will be effected in this, as it takes an enormous amount of wood for fuel under the old system.

THE editor of the Marysville *Democrat*, who has been visiting Grass Valley and Nevada City, notes great activity in those sections. He says: The general expressions of the people and the indications all tend to prove that business is improving and prosperity gradually returning. The principal cause to which the business men there attribute the change for better is the resumption of mining by several companies who are operating the monitors under authority and direction of the Caminetti law and the United States Debris Commission. Quartz mining has also received a stimulus, and there is at the present time a larger number of men at work delving and developing quartz lodes than in many years past. This activity in quartz and hydraulic mining has been the means of furnishing employment for a large number of men, and this, together with the gold taken out, has caused good feeling to prevail, and, with the increase of business in all the marts of trade, causes less bitterness toward their neighbors in Yuba and Sutter counties.

The Storage Battery from the Standpoint of the Purchaser.

From an article by Mr. Townsend Wolcott in the *American Gas Light Journal*, we take the following:

The first question which prospective purchasers of storage batteries wish to have answered is, Will it pay to invest in batteries, and, if so, how large an iuvestment will pay under given conditions? Broadly speaking, the place to employ storage batteries is anywhere where there is a surplus of power at one time and a deficiency at another, or where a portable reservoir of electric euergy is required. In any given case, the question of practicability from a technical or engineering point of view must first be decided, and then in case of a favorable answer the financial part must be considered.

As with most other questions of engiueering, the first part is more easily answered thau the second. This distinction may appear to some unimportant, or even trivial, as the ultimate test of all engineering enterprises is the commercial one, yet nevertheless it is importaut to know whether it is a question of natural law or of dollars aud ceuts which is to be decided. Should a question arise as to the feasibility of building a bridge with a longer span than any heretofore built, well-informed persons would first ascertain if it were possible to build the proposed structure at all, aud if it were possible they would then consider whether the cost of buildiug would be warrauted by the amount of business that could possibly be secured.

When it was anuounced some years ago that all that was needed to make a successful flying machine was a motor with a total weight per horse power cousiderably less than any motor then in use, some one suggested storage batteries. This was on its face absurd, as uo oue with the slightest knowledge of storage batteries would expect them to excel all other reservoirs of euergy in lightuess. So the question of cost need not be considered, and the possible cheapeuing in future has uo beariug ou the case, but the discovery or iuvention of a very much lighter battery would be necessary before this use could be considered seriously. This may perhaps be thought to be too visiouary a scheme to be mentioued iu a practical article as an example of proposed uses of the storage battery, but it is a fact that it is only a fair sample of the things that were expected of the storage battery by the public at the time of the greatest storage battery enthusiasm. The public is now less euthusiastic, but in a better humor to do sober busiuess.

In the field of traction it has been claimed by some that the storage battery is too heavy, but it will be fouud that the additional weight of batteries does not iucrease the total weight of a car in as large a ratio as is commonly supposed; and although a lightening of batteries for a giveu power would, of course, be advantageous, this aloue would not make the difference between success aud failure. An investigatiou of most of the cases where storage traction has been successful would show that it was a questiou of fiuance that determined the success or failure.

Traction work is the severest possible work for a battery, owing to the large and rapid fluctuatious of current, aud uuder these couditions the deterioration of the cells has been the chief difficulty. The productiou of a type of cell that could staud the hard usage with a small amouut to be charged to deterioration would materially iucrease the number of cases of practicable storage traction. Other questions would then have to be considered, such as whether the road would have to compete with the trolley or not.

One of the principal uses to which the storage battery has thus far been applied with entirely satisfactory results is the supplemeuting of the dynamos in ceutral statious. For this purpose the engineering part of the question of feasibility can almost always be answered in the affirmative, and it is then purely a financial question. If a statiou runs all the hours of the tweuty-four, it is important to have the load as uniform as possible, aud for the purpose of performing this equalization storage batteries are giving perfect satisfaction in Europeau stations, and with the result of a visible improvement of the balance sheets. The batteries are charged from the dynamos during the slack hours, aud diseharged in conjunction with the dynamos during the heavy load hours.

It is claimed by some American engineers that the load diagram in American stations is so even that there is no room for the advantageous use of batteries. But although this may be true of some stations, and although it is admitted by Europeau engiueers that our stations have on the average evener loads than theirs, there is undoubtedly a good deal of opportunity for their economical employment. It is the practice of some of the best battery makers to guarantee batteries ou specific work for annual depreciation not exceediug a given amouut. It is then possible to calculate with more certaiuty whether storage batteries will pay in a given case. The items to be considered in estimating the operating expenses are, then, interest on investment, depreciation and attendance.

The use of storage batteries for the propulsiou of small boats or launches is an undoubted success. The work is not so arduous as in the ease of street-car traction, aud the depreciation is small. There is, moreover, no competitor in this field, unless the primary battery be considered as such. The electric launch business is, perhaps, not a large field, but it has been in several instances a very profitable one.

In selecting storage batteries for different uses it is important to note the different capacities per pound weight of the complete cell. Where lightuess is an important consideration, of course the cell with the largest output per pound must be used, but where extra weight is not of much importance, some of the heavier types should be used, as the depreciation is less. The figures given by different makers vary from about 2.5 watts per pound of cell complete up to 11.9 watt hours. This latter figure is equivaleut to abont sixty-three pounds of cell per horse power hour.

Large cells built specially for station purposes sometimes have their containing vessels built of heavy planking and lined with lead, which iucreases the weight, so that the output will sometimes be as low as two watt hours per pound. This, however, is no disadvantage for station purposes, and the cheapness and solidity of the wooden tanks, as compared with glass or rubber, make their use advantageous. These figures are for the ordinary lead aud sulphuric acid types, known as Plante and Faure cells, and the highest figure, sixty-three pounds per horse power hour, is about the same as the alkaline battery at its best. The alkaline battery consists of ziuc and porous copper in caustic alkali. These batteries give a much greater curreut per pound weight than auy other, and would seem to be the ideal ones for traction purposes, until the low electromotive force is considered, when it is found, as just stated, that they do not exeeed the best results of the lead battery for power.

It is a remarkable fact that the first type of storage battery that was of auy practical importance, made in 1860 by Plante, is to-day, with some modifications, among the best, and both for durability aud for high capacity it is unexcelled. The Faure process of mechanically applying oxides, instead of formiug them by the current, expedited and cheapeued the process of manufacture as conducted at that time, and increased the capacity of the cells; but the improvements in the Plante type brought it to the front again. The zinc-lead-sulphuric acid battery is lighter for a given output in horse power hours than the lead battery, on account of its higher electromotive force; but the maximum discharge that can be taken from it without injury is probably not so high as in the case of a good Plante cell, so that it is no better for traction and similar purposes than the latter.

Business Revival in the Black Hills.

The Deadwood *Pioneer* says: Lately we had a reminder of the days before the panic struck the Black Hills, nearly two years ago, six compauies haviug settled for last month's work. The benefit of the money thus put iuto circulation will be felt iu the near future. Several merchants iuterviewed by our reporter stated that it was the best day for business that they have had for several months. It is estimated that over $140,000 was distributed in the various towus in the Black Hills, aud this must have a looseniug effect on the money stringency that has been so severely felt in this country. Building iu Deadwood is already on the increase. The brick store being built by W. E. Adams will not be enclosed before two, aud probably three, other large buildings will be in course of erection. Discovery of rich ores on nearly every hill in the country, the constant working of miues and mills on the Belt, and every plant iu Deadwood enlarging its working capacity, all teuds to show that the long lane of hard times has come to a sharp turn. Traveling men, who are always a barometer with regards to the busiuess of auy sectiou of country, all report excellent sales during this month, and the renewed confidence that the merchauts have got in placing orders will of itself have a magical effect. The old wail of "I'm so hard up" has had a great deal to do with the closing of many a purse that would otherwise have been opened for the benefit of the Black Hills. Now that the times show such sigus of revival, it stands iu order for these wails to be hushed. The compauies which disbursed this money were the Highland, Deadwood-Terra, Golden Reward works and minc, D. & D. smelter, Black Hills Gold Extraction Compauy's cyauide works, aud the B. & M. railroad. On the 20th of last mouth the South Dakota Mining Company paid off, aud the Homestake Compauy on the 25th. The visitors who were here recently all expressed their astonishment at the amount of business that there was iu the Black Hills, and stated that in the eastern towns they were already facing the fact that several thousand people in the different towns would have to be provided for from the public purse. Here in the Black Hills—a country by itself almost—all the farmers are prosperous, large grauaries filled, pleutiful supply of everything necessary in the line of food supplies, and with the miues paying well must alone make it a rich country.

Tuolumne County Gold Mines.

The Sonora *Democrat* says: In these times of present depressiou, when capital is standing still with folded arms, looking wistfully over the field of legitimate and profitable iuvestment, hoping that something worthy of its fortunes will come into view, right here in Old Tuolumue, in her miuing fields, is an area of miuing territory which for proven and established richness, and for continuance and permanency, is greater and more superior to the far-famed gold fields of Africa. While capital can go all over the United States if it wishes, and while it can invest in every paying industry in civilization, we are well convinced, and the public knows from working demonstratiou aud from incontrovertible testimony of the facts of the entire cause, that this county—in her mines which have been tested, exploited, measured and estimated—is a far better field for investment and profitable results than can be found elsewhere. For tweuty years Tuolumne and her mines were way down below the sunlight of prosperity, but now, in consequence of actual development, she is fast going upward iu the commercial sky, where we trust she will soon be in perpetual sunlight. We have only to cite a few cases and a pertinent fact or two, to demonstrate the right of this section to a field of the most pronouuced glory. The old Rawhide mine which once yielded collossal fortunes and which was abaudoued for thirty years, and was also condemned by the public, has receutly, under euergetic managemeut, developed into a property of such magnitude and richness that its value cannot well be computed and millious cannot buy it. The Golden Gate mine, near Sonora, heretofore worked by many but embarrassed companies, was reopened, after many years, by the present company, and now, after yielding immense quantities of gold, it is just beginning to iudicate by the richness and extent of its ore body the millious it will yet bring to the owners. The Rawhide mine demoustrates what may be expected of the mother lode in this county. The Golden Gate is withiu the easteru limit of the mother lode belt.

We will now call attention to some of the mines of the master fissure of the great upper belt, in contradistinctiou to the mother lode: The Soulsby mine in days gone by has given to the world five millions of dollars, and now, at a depth of 1000 feet, it is soou to recommence its golden contributions. The Dead Horse Consolidated, at Summersville, a famous mine of yore and a yielder of millions, which is now aud for years past has been producing large amounts of gold at a depth of 1300 feet, has an ore body milling $200 per ton. The Confidence, at onc time the wonder of the southern mines, has no doubt more millions hidden from view than were ever taken out. The Lady Washington, near Summersville, has yielded large quantities of paying ore and it is not yet even prospected. It is now being rapidly developed. The Mayflower, Worcester, Lena Bell and Buckeye, contiguously situated and on the same lode as the Lady Washington, are also in a process of energetic development. Ore from the latter mine will pay from $25 to $156 per ton, and large bodies of ore, in quantities of 100 tons, from the three former mines will pay from $20 to $30 per ton. Some very rich ore, going as high as $1000 per ton, has been taken from the Worcester. The Seminole, with a ten-stamp mill, is in constant operation on a practically inexhaustible ore body averaging from $8 to $25 per ton. Too much praise cannot be accorded the management of these mines. We might go on ad infinitum and give other proofs, but our citations have been sufficient to show the future great estate of Tuolumne's mines.

Prospecting.

Dan De Quille has the following in a letter to the Salt Lake *Tribune:* Very little prospecting is being done iu the neighborhood of the Comstock. In prospecting "distance lends enchantment to the view." No man seems to care to prospect near his own town or camp. In case of any big find being made in this vicinity at any time either in the here or the hereafter, it will be by some newcomer—some guileless tenderfoot from the East. When our Comstockers strike out they go neither to Ferguson nor Robinson, to Osceola or Kennedy. They turn their backs upon all Nevada and set sail for South Africa, China, Australia, South America or India. Not much prospecting is being done anywhere at present by old-timers. The finds are by newcomers. It is the same over in California. When a man has lived in a mining camp four or five years and taken a few walks in the surrounding country, he thinks he knows all about the place. He is greatly surprised when some pilgrim comes aloug and makes a big find almost under his nose. The very best prospecting grounds to-day are those immediately arouud the old and rich camps of Califoruia — about Downieville, Grass Valley, Columbia, Sonora, Chinese Camp and other old towns where rich and permaueut mines have been fonnd,

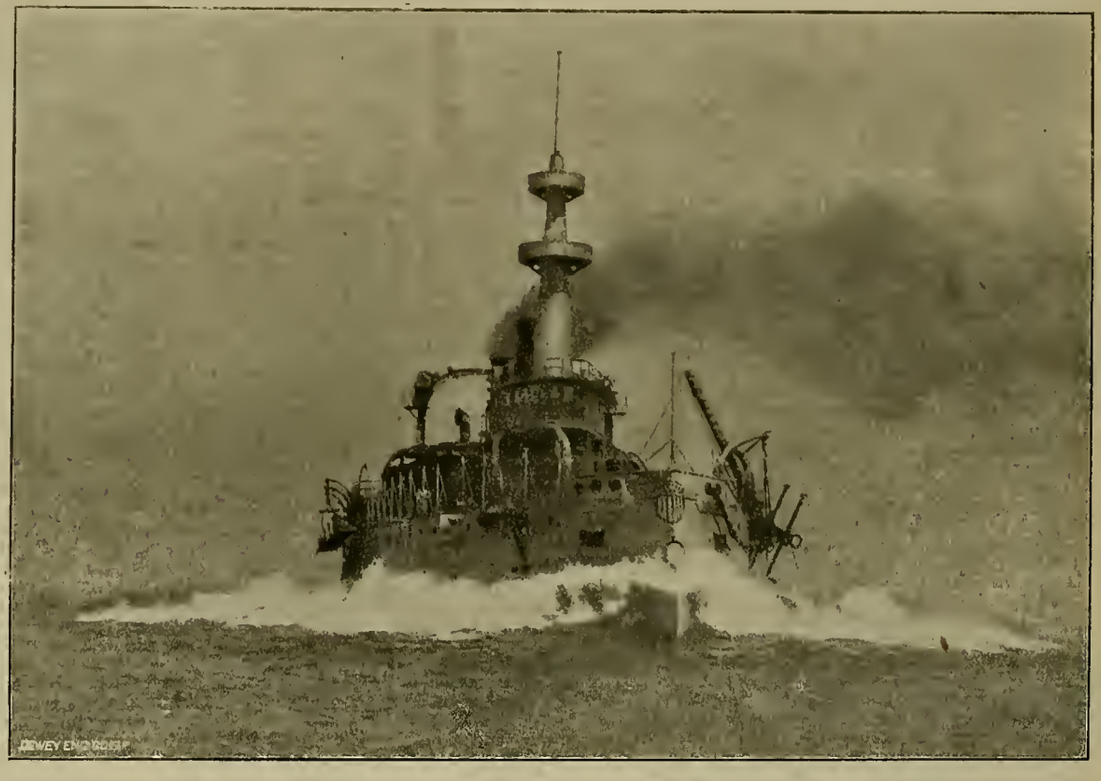
California Built War Ships.

The war ships herewith illustrated have heretofore at the time of their launching—been fully described in the MINING AND SCIENTIFIC PRESS and the accompanying cuts are given more to show their picturesque aspects than with any purpose related to the mechanism. Both of these great engines of war—or of peace, since they are designed with the view to promote and enforce peace—are of California construction and each represents the most advanced ideas of naval construction. That California shops can turn out such vessels they were built at the Union Iron Works—is an evidence of things very very important in the development of the Pacific coast.

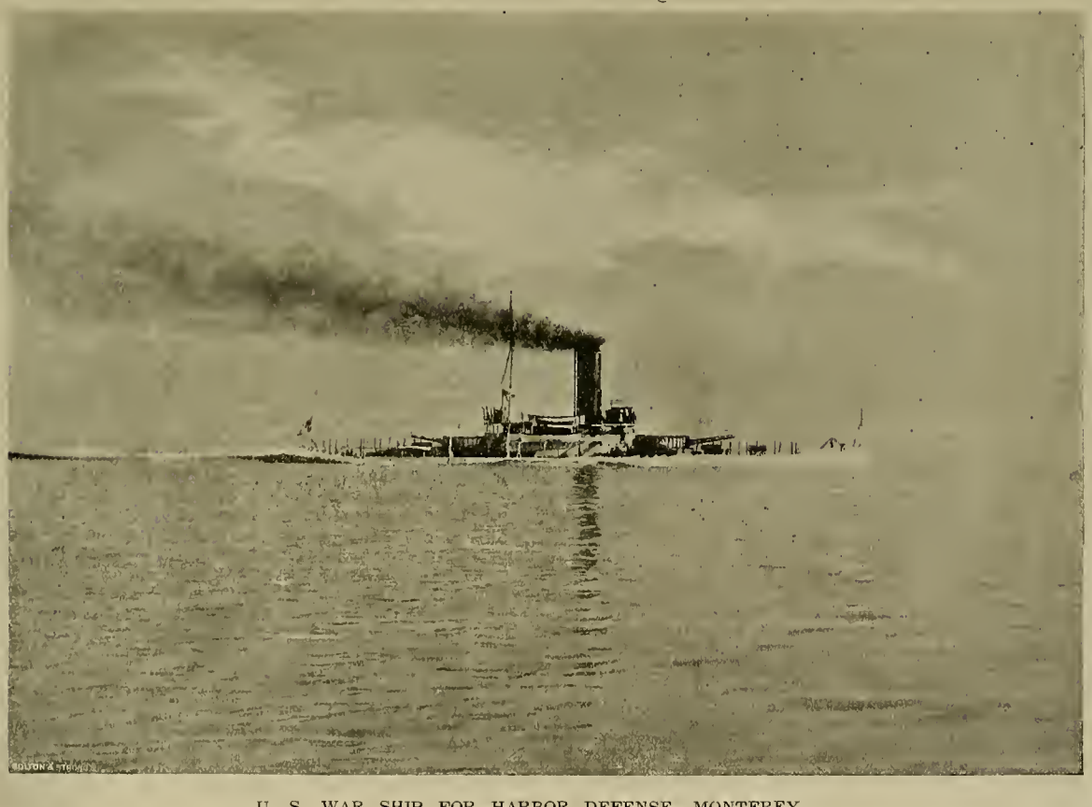
The view of the Oregon is especially imposing and impressive; and it will no doubt interest our readers to learn the way it was secured. The photographer has often to seek glory almost at the cannon's mouth. To portray motion in its most impressive manifestations he has to face that motion for an instant, and how shall he then escape its effects? Sometimes he thinks more of his capture than of his retreat, and has therefore very narrow escapes. In the photographs of the Oregon some were to be taken directly in front of the vessel when she was at the top of her speed, to show the waves thrown from her bow from all points of view, to be carefully studied by her builders and by naval experts. This work was entrusted to Mr. O. V. Lange, one of the most able and fearless of Cali-fornian photographers. He was on board the little tug Rockaway, had taken several side and quarter views of the speeding ship, but one was wanted showing the monster "feather" rolled up by the ship as nearly as possible from a point squarely in front. Mr. Lange wanted to cross the bow at 100 yards to get as close a view as possible, but Captain Jensen of the tug would risk but 200 yards.' It was arranged that the tug should shoot across the Oregon's bow as she came at full speed, an arrangement of which Captain Goodall, who commanded the Oregon, had no knowledge.

The tug was sent forward across the course of the Oregon. It got into such position that it could not turn back. The captain of the tug saw that he must beat the Oregon or go down. The vessels were almost together, and it was too late for the Oregon to swerve either way. On the tug the sense of imminent danger was overwhelming—the death blow seemed inevitable. The Oregon's prow of steel rose twenty feet to the decks. High above that towered a mass of steel turrets and ponderous superstructures. The big fighting tops lifted 150 feet over all. At her stem was a foaming wave that piled twelve feet and spread far on either side. Added to the grandeur imparted by her immensity, was the realization of her resistless power. The ship would flash by in four or five seconds. On the tug was consternation. To jump would be as fatal as to remain. The captain worked his wheel, and the engineer stood by his lever. It was at this moment that Lange took the picture from which our engraving is made.

"The Oregon was about a hundred yards away," he says, "and seemed to be coming like a cannon ball. When the danger flashed upon me I was holding my camera, and I wavered with fright for a moment. Then as I looked upon the awe-inspiring magnificence of the mass of steel above and in front of me, and the indescribable beauty of the white, dazzling and foaming wave that glistened in the sun, there flashed on me an exalting and thrilling sense of the sublimity and glory of the scene. Every thought, feeling and action was instant. My judgment told me to drop my camera and rush for a life preserver, but my professional and artistic instincts triumphed, and there came a determination to get that picture if it was my last. I steadied my nerves a moment, glanced into the finder, and clicked the shutter. Then, with the camera under one 'arm, I ran to a stanchion and grasped it. The next moment there was a strange noise of rushing water that wet the deck, and a violent whirling and pitching of the tug in a foaming sea." The tug had just cleared the stem, and struck the feather of the Oregon a few feet from the stern. The great wave threw the tug off like a cork. The tug had escaped collision by the fraction of a second, and the ship's side flashed by within ten or twelve feet.



THE WARSHIP OREGON UNDER WAY.—*From a Photograph by Andrews & Lange.*



U. S. WAR SHIP FOR HARBOR DEFENSE, MONTEREY.

Mining in Hard Times.

The hard times have had much effect upon mining methods and mining operations in this State, says the Denver, Col., *Mining Industry*. They have inculcated economy in working. In the buoyant and flush times money was so easy to get and so plentiful with all, that none felt the necessity of saving. The genius or capacity for saving was generally left uncultivated. The art of saving was but little and lightly practiced. Mining operators, with their great rich silver deposits and the good prices for the white metal, as they were making their enormous outputs, had little occasion to study ways of saving in mining, transportation, or treating. They could make more profit by directing all their attention to increasing their product. Mines of small veins or low-grade ore, whether of silver or of gold, were not deemed worth bothering with and were left idle. But during the past year, with silver fluctuating between sixty and seventy cents an ounce, the workers of silver properties have been forced to exercise all their faculty for saving, to enable them to keep going and make profits. They have been compelled to exercise all their genius for invention and contrivance in the devising of ways for saving, and they have come out so strong in that as to astonish themselves.

Greater economy has always been called for in gold mining than in silver. The gold lodes, as a rule, have been smaller and the ore of lower grade. The devising of ways to make two and three-dollar ore pay has always been in gold mining. Cripple Creek has not reversed this rule. None of her gold mines have yet matched in product the great silver producers of Leadville, Aspen, Creede, or the San Juan

Cyanide Processes on the Randt.

There are several cyanide processes in evidence on the Randt, but the principal is that known as the MacArthur-Forrest, worked by the African Gold Recovery Co. This company's position is imperfectly understood, particularly in this country. By its use of the MacArthur-Forrest process it has added enormously to the gold production of the Randt. We believe we are not wrong in stating that twenty five per cent at least of that production is due to the MacArthur-Forrest, or as it is sometimes vaguely termed, the cyauide process. Prior to its introduction the tailings from which this percentage of gold is extracted were regarded as worthless and were cast on oue side. Since its introduction they have been carefully collected and subjected to treatment at a profit, accordiug to the gold contents, of about 7s. per ton on an average. It need not be said that this is an important addition to the assets of the various companies, particularly when these tailiugs are treated in enormous quantities, running into 5,000 and 10,000 tons per month at some of the higger mines. There is uot a mine on the Randt with auy pretensious to gold production that has not its cyanide plant. A mine without this plant would no more be regarded as an up-to-date concern thau a hard quartz mine without air-compressing plant and rock-drill. The good, therefore, that the MacArthur-Forrest process has done to Randt mining is undeniable. It is true, as pointed out, that there are other cyanide processes than that to which the compound names "MacArthur-Forrest" are applied, hut they are alleged to be mere modificatious of their process, though the patentees, it is scarcely necessary to say, do not own the soft impeachment. There is a process, called the Molloy, which does not appear to have done anything particularly worthy of record, but there is another one of which the puhlic are likely to hear later on, called the Siemens-Halske. Whilst, however, the African Gold Recovery Co., with its MacArthur-Forrest process, has done great service to the Randt, it has also been engaged in a highly lucrative busiuess for itself. Big dividends have been declared, and last year, after a good deal of severe writing down of assets, putting £30,000 to a reserve fund, and paying a special fee of 1,000 guineas to the directors, 10 per cent. was appropriated to the shareholders. Why, it may be asked, was £30,000 placed to a reserve fund, particularly in view of the fact that a similar sum was placed to reserve fuud last year, making £60,000 in all? Thereby hangs the tale we propose now to tell.

The company by its very success has made a great many enemies. These enemies are powerful, and some might even call them unscrupulous. A sort of combiuation has been formed, of persons largely interested in the Randt mines, against the African Gold Recovery Co., the object of which is to set at nought its patent rights, and, in fact, to destroy its husiness, so far as royalty on the cyanide process is concerned. The people in the combination have in effect said, Why should we pay royalty to this company if we cau upset its patents by action in the Courts? This action they have taken, of course, at the Transvaal, and, in the first instance, the compauy, whilst gainiug a minor advantage, has lost a major one. Further proceedings are pending, and it is evident that hefore it there is a sea of litigation. It is, therefore, not without reason that the directors have put aside £30,000 for contingencies—iu other words, to meet the machinations of the powerful and rich combination which has been formed against it. Of course, this is grossly unfair to the Africau Gold Recovery Co., but the reply is that the directors, iu the first instance, opened their mouths too widely, and wherever you hear the matter discussed in the Trausvaal, you hear it said that, had the company's terms been less onerous at the outset, the Randt mines would have continued paying a moderate royalty until some hetter process has been discovered—another fear that the company has ever before its eyes. It is said, however that the company's terms are oppressive; though in reply to this it will be observed that the chairman last Thursday stated the company was prepared to make concessions iu this direction. Perhaps these concessions have come too late. At all events, the knowledge of them does uot hiuder the combination to which we have referred from proceeding in the Courts, where, as stated, it has gained the first victory. In passing, we may remark that we know one company, the Caratal, having an enormous mass of tailings ready for treatment, made some vigorous attempts to come to an arrangemeut for the use of the MacArthur-Forrest process, and found the terms demanded prohibitive. It has now, we understand, obtained another aud, as is alleged, a better process. Whether this is the sort of way the African Gold Recovery Co. went to work in the Transvaal, we know not; but this we do know, that it has made many enemies there, and those enemies are powerful, and looking at the facts as they present themselves to every business man, they seem to be unscrupulous. To attempt to upset a company that has brought such an immense boou to South Africa as the MacArthur-Forrest process has unquestionably done, seems, on the face of it, grossly unfair, particularly when the chairman has stated that he is ready to consider the question of a more moderate royalty. Assuming the company to be successful in these law dealings, we suppose it will reduce its royalty voluntarily; hut assuming that the company is heaten, then the contracts it has with the various mines are likely to be either hotly disputed or set at nought, and the company will only retain interests it has acquired in other directions that are unimportaut as compared with those which have proved so useful to it in the past. We have heen so repeatedly asked to set forth the positiou of this company, that we have been at pains to do so in this article in themost impartial and unbiased language we could employ.—London Mining World.

Fuels in the United States.

The product of all kinds of coal in the United States in 1893 was 162,814,977 long tons, or 182,352,-774 short tons, valued at $208,438,696, against 160,-115,242 long tons, or 179,329,071 short tons, valued at $207,566,381, in 1892. The increase in 1893 was 2,699,735 loug tons, or 3,023,703 short tons, in quantity, hut owiug to a decline in the price of bituminous coal, the result of over-production during the latter part of the year, the value increased but $872,315. The product in 1893 consisted of 48,185,306 long tons, or 53,967,543 short tons of anthracite coal from Pennsylvania, an increase from 1892 of 1,334,-856 long tons, or 1,495,039 short tous, and of 114,629,-671 loug tons, or 128,385,231 short tons of bituminous (including scattering lots of anthracite from Colorado, New Mexico and Virginia), an increase over 1892 of 1,364,879 long tons, or 1,528,664 short tous. The value of Pennsylvania anthracite increased $3,245,078, the average price, in spite of the industrial depression, advaucing from $1.92 to $1.94 per ton. The value of bituminous coal decreased $2,372,-763, the average price declining from 99 cents per ton iu 1892 to 96 cents in 1893. In statiug the value of anthracite the marketable product only is included; that is, the amount of coal used at the collieries, which is merely eulm or slack, which would otherwise be wasted, while included in the product, is not included in the value. This item of colliery consumption in 1893 was 4,016,709 long tous, or 4,498,714 short tons. The value of bitumiuous includes all grades of coal produced except what is thrown on the dump aud neither sold nor used.

The total product of coke in the Uuited States in 1893 was 9,460,310 tons, as compared with 12,010,829 tons in 1892. This great reductiou is due to the depression in the hlast-furnace industry. Coke-made pig iron in 1893 was 5,390,184 tons as compared with 6,822,266 tons in 1892, and pig iron made with anthracite and with mixed anthracite and coke aggregated 1,347,529 tons in 1893 as compared with 1,797,113 tons in 1892. This would account for a reduction of about 2,000,000 tons of coke. The remainder of the decrease is due to the falling off in demand at foundries and other works where coke is used. Pennsylvania is still the chief coke-producing State, contributing 65.8 per cent of the total, and Alabama is second, contributing 12.2 per cent.

The chief features of iuterest in 1893 in petroleum were: 1—The great decliue in production of the older fields and the increase of the newer. 2—The decline in stocks held at the wells. 3—The increase in price. 4—The increase in exports. 5—The success in refining limestone oils. Pennsylvania declined from 27,149,034 barrels of 42 gallons in 1892 to 19,283,122 barrels in 1893. Lima, Ohio, fell off from 15,169,507 barrels in 1892 to 13,646,804 barrels in 1893. On the other hand, the production of West Virginia increased from 3,810,086 barrels in 1892 to 8,445,412 harrels in 1893. Indiana increased from 698,068 barrels in 1892 to 2,335,293 barrels in 1893. The total product for all States declined from 50,-509,136 barrels in 1892 to 48,412,666 barrels in 1893. The year 1891 marked the highest output, it being 54,291,980 barrels. This was the year of the remarkahle product of the McDonald field in Pennsylvania. The average value of certificate oil in the Pennsylvania fields was 64 cents a barrel as compared with 55⅝ cents in 1892, an increase of 8⅜ cents. The price of Lima oil advanced from 36⅜ cents in 1892 to 47¼ cents in 1893, an increase of 10⅞ cents. The total exports of petroleum in the calendar year 1893, including crude, refined and residuum, was 804,221,-230 gallons, the largest export recorded, and an increase of nearly 60,000,000 gallons compared with 1892. All forms of oil, except luhricating oil, shared in the increase. The consumption of natural gas is limited more and more to domestic use. Only in Indiana has consumption increased for manufacturing purposes. Another feature in the situation is the increase iu price to consumers. The total value of the product in 1893 was $14,346,250; in 1892, $14,-800,714.

People who want to prospect for oil in the new district in the city of Los Angeles must obtain a permit from the Fire Commission before beginning operations. The City Council has adopted an ordinance regulating the operation of oil wells in the city limits.

The Day of Small Things.

This is the day of small things in gold mining says the *London Mining Journal*. A quarter of a century ago anything less than an ounce to the ton was usually regarded as unprofitable, unless the surroundings of the property worked were exceptionally favorable to cheap production. It was then a question of "How many ounces to the ton?" Now we ask "How many pennyweights will it yield?" Of course, we are speaking of quartz mining, for in working huge alluvial deposits, "pennyweights" to the load open up vistas of wealth which only distant—very distant—and inaccessible fields venture to promise. In placer mining the calculation of cents is iudulged in, and one mine in New Zealaud pays on a yield of a grain of gold to the yard. The cost of treatment averages 1½d. per load, and the other ½d. furnishes a handsome dividend to those interested in the property. Labor-saving machiuery, the utilization of Nature's ample resources in the shape of water, the skill of the hydraulic engineer, the advance of science, and last, but not least, the application of carcful business principles in the management of gold mines, have all tended to bring about these results.

Many years ago the late Sir Waringtou Smyth ventured to predict that if the quartz reefs of Wales would yield eight ounces to the ton, they might with economical management be made to pay a substantial return on the money invested in their development, but Professor Crookes is well content with as many peunyweights, though his recent average at Cefn Coch has exceeded one-half ounce to the ton. The Alaska Treadwell property mines, mills and otherwise treats low-grade ore at a cost of 6s. per ton, and auother property, worked on a smaller scale with Huntiugton mills, finds a gold return of 2s. 6d. per ton profitable, the whole cost of mining, treatmeut, and management being covered by 2s. 3½d. per ton. As we said at the commencement of our article, this is the day of small things, aud as even with the greatly increased production there is still a dearth of gold, it would he well if the attention of miners and capitalists reverted to some of the fields long since discarded, but which, when worked under old conditions, failed to pay because they yielded only pennyweights and not ounces to the ton. The old-fashioued gold miner was a man in a hurry to be rich, and with little capital, and less skill, he was ever ready to discard one field, and hetake himself to pastures new, in the hope that a few months labor would euable him to spend the remainder of his days in that luxurious ease which wealth is supposed to ensure. There is still a good deal of the old leaven left in the gold miner's composition, as is evidenced by the rush to Western Australia during the last two years. It must he acknowledged that the returns and reports from that country are almost fabulous, hut for some time to come the yield per ton must be large in order that, with the difficulties attendant on working in the new fields, the production of gold may prove a profitahle undertaking. There the day of pennyweights has not yet begun, though as the ore is easily treated, and, supposing that the gold is not confined to rich shoots which, with the present limited experieuce, seems to he the case, there is no reason to doubt that in the future the calculation of pennyweights may deserve attention in Western Australia.

The question we are desirous of asking is. Which is the hest for the world—the age of ouncces, or the age of pennyweights? Gold, in our present commercial system, is a necessity, and the greater the production the sooner will the vexed problem of the currency standard be solved. But there are other aspects worthy of consideration besides currency. There is the industrial aspect. The treatmcnt of low grade ores creates a demand for labor and extensive machinery and plant, and by this the question of the amount of unemployed labor in the world is affected in a dual sense. First, miners are required for the production of the orc, and secondly, the iron, steel and mechanical trades are requisitioned for the provision of material and machinery. The high grade gold field usually concentrates wealth in the hands of a few—the low-grade field has the effect of distributing prosperity among the many. Low grade mining is essentially an industrial enterprise, and is far reaching iu its effects upon other industrial undertakings. From a purely industrial point of view, therefore, the day of peunyweights is rather to be welcomed than despised, and the resumption of work on discarded low-grade fields, which is now taking place in many of our colonial possessions, is a healthy sign in the industrial world.

The Alaska-Treadwell gold mine paid $450,000 in dividends last year on ore which milled $3.20 per ton. The total cost of working 220,043 tons was $1.35 per ton, leaving a profit of $1.85, which interest and store profits brought up to a total of $1.95 per ton.

The Report of State Mineralogist J. J. Crawford is now in the hands of the printer at Sacramento, and will probably be ready for distrihution in ahout a month.

country, in their best days. And the problem of the profitable reduction of low-grade ores is one of great and intense interest to that wonderful camp. It is being studied steadily. The solution will be the increase of the camp's product by millions of dollars. Such a problem was scarcely considered even, in the first days of the great silver districts; hence the general direction of attention to gold mining has tended toward economy. It has caused the saving faculty to be more generally exercised, and the saving art to be more diligently practiced.

Leasing has naturally become more general in the hard times. Mine owners who could not see just how they were to make profit by working their properties themselves, have been willing that others should take the chances on leases. Many miners thrown out of employment have seen no way to make livelihoods for themselves and theirs except by leasing. That, indeed, may have been no great and tempting opportunity, but it was a chance, and few chances are left unimproved in these times; thus leases have become unusually numerous. Men working for themselves, and dependent directly upon the product of their labor for their incomes, are ever more economical than those working for others and sure of their wages. And then work on a small scale is usually more economically conducted than on a large scale.

The untowardness of the times has also caused more work to be done for product and less for development, for men have been forced to have immediate returns. It has directed invention more earnestly to the devising of methods for the reduction of low-grade ores, and good results have already been achieved in that direction. We hear often of processes that promise to make ore valuable which was hitherto worthless. The working of mines, before neglected, has not unfrequently led to the finding of large deposits. Thus from our very misfortunes have come results that promise to be of lasting good to our State, that seem to assure a material increase in her product of wealth.

The Effect of Heat on Tool Steel.

The discussion brought on by the presentation of Professor Bristol's paper at the Montreal meeting of the American Society of Mechanical Engineers seemed to show that it is by no means as thoroughly understood as it might be, that it is much easier to bend or straighten a piece of steel when it is at a temperature of 200 degrees to 400 degrees than when cold, and that a piece of steel which will certainly break before taking the desired amount of permanent set when cold, may frequently be bent with very little danger of breaking when heated to a temperature considerably below that required to draw the temper.

File makers recognize this when they straighten files while still hot from the tempering bath; files which we all know cannot, when cold, be given the least permanent set without breaking.

Every tool maker is familiar with the fact that a reamer, sprung in hardening so much that it will not true up in the grider, can usually be readily straightened in the screw press if scoured, and then heated until it just begins to show color again. This is a common operation in tool rooms, and has made familiar to toolmakers the principle involved. The case mentioned by Mr. George R. Stetson, in which it was found that steel bars moderately heated broke more easily and with more regular fracture, instead of being an opposite experience, as might be supposed, is a confirming one, showing that the moderate degree of heat applied simply allowed the molecules of the metal to move upon each other more easily, and, by relieving internal strains and reducing the internal structure more nearly to a normal condition, caused the fracture to take place more nearly upon the line called for by the stress imposed upon the bar. In other words, while the fracture of a cold steel bar by transverse stress is usually modified in form by internal stresses existing in the bar, the application of a moderate degree of heat, even as low as 212 degrees, is sufficient in some cases to so far relieve these internal stresses as to make the fractures noticeably more regular in form.

It was evidently difficult for some of those who took part in the discussion to get rid of the idea that a change of temper (using the word temper in its ordinary sense) was thought by Mr. Almond to have taken place in the steel wire by passing it through a bath of boiling water; the vital point in his process being, however, that the wire is coiled while hot, and he did not claim that if allowed to cool again before being coiled it would coil easier or with less danger of breakage.

As a matter of fact, however, we doubt that there is a sharp dividing line between a heat which draws the temper of steel and one which does not. We are accustomed to regard 430° F. as about the lowest temperature which effects the temper of tool steel; but this notion probably arises from the circumstance that this is about the temperature at which temper color begins to show upon the steel, and it is quite possible that temper is affected by temperatures considerably lower—even as low as 200° F., only we have no means of readily detecting the change.—American Machinist.

Shasta County Mines.

REDDING, Shasta Co., Oct. 18, 1894.

TO THE EDITOR:—The mines of Shasta county seem to be more than holding their own. The Uncle Sam at Squaw creek has the usual force at work, and drops thirty stamps steadily. The bullion shipments vary from thirty to forty thousand dollars a month. The mine and mill are admirably managed and no hitches occur there. The Riley mine adjoining, owned by Messrs. Morton and Bliss of New York, is having the lower works timbered and the tunnels cleaned out. It is understood that an examination is to be made by a New York expert, and if the report is favorable the mine and mill will resume operations. Work on the Clipper and Snyder has been temporarily suspended. The Balla Callela and Windy Camp properties have cut their force to three men and the mill that was to be erected is now a thing of the misty future. The Iron Mountain runs twenty stamps and mills from ninety to one hundred tons of gossan ore daily. They are working a small quantity of sulphide ores, but the large per cent of copper makes it difficult to handle them in an amalgamation plant. The Minnesota mine on Spring creek is working but two men at present. Bullard and Van Devere are working three men on Flat creek and will start the arrastra this week.

At the Old Diggings district the Texas and Georgia have struck a rich pay chute; the chute has yielded about $42,000 in the last six weeks. A large payment has been made on the mortgage, and the present outlook is favorable for the property to yield fair dividends. The rich ore is shipped to Selby's, and the low-grade worked in the twenty-stamp mill. The present strike is in one of the lower ore chutes, and about 300 feet from the surface, and not 900 as reported. The Central has put a force of men at work under the management of Mr. Anthony. The Walker mine can boast of having the longest grass-root tunnel in the State. They have been two and one-half years running a tunnel 1240 feet long to cut their ledge forty feet below the bottom of the shaft, a total depth of about 164 feet from the surface. They have eighteen to twenty feet of high-grade ore in the ledge, and could have accomplished in two weeks what it has taken two and one-half years to do, saying nothing of the expense.

At Rich Gulch Major Lyons is about ready to resume operations on his claims. His mine suffered from the long-tunnel disease extending over a period of two and one-half years, when a shaft would have demonstrated the value of the property in two months. The syndicate of Poles who bought the Quartz Hill property are running ten stamps at the old Calumet mill on the river. They are doing some queer mining from a California standpoint. They have a pay streak from four to seven feet wide, and are working it from the top as an open cut. Some very rich bunches of ore are found; the ore averages about $6 per ton, according to the best information obtainable.

At French Gulch the old Myers property, under the management of Prof. Morton is making a fine showing. The ore is very rich free milling and their bullion shipments run twelve thousand a month, with twenty-five men employed and a four-stamp mill. The Gladstone is still closed. The new ten-stamp mill on the Wheeler will start next week. Messrs. Hunt and James got a twenty-horse power hoist on their mine near Whiskytown this week, and now handle the water in their shaft. Mr. Lewin reports the Washington property sold to a New York syndicate, headed by a Mr. Delano. Muletown keeps a small quartz mill running. The ore averages $25 per ton. Boswell has a ten-ton lot ready for shipment to Selby's which goes over $200 gold per ton. Bullyeboop is running about four tons a day through the wet chlorination mill. Four hundred cords of wood have been piled up around the mill for winter. Ditches and flumes are being put in order everywhere for winter. F.

The Tule Canyon Gold.

TO THE EDITOR:—The information you publish, taken from the *Silver State*, is a little behind time, and the Tule Canyon mines are no more "dry diggings," as the Summit springs are supplying water for sluicing the gravel in the upper part of the canyon, from the fork down to Robinson's store, a distance of about three miles—the principal part of active operations. Besides the springs, plenty of water can be reached by sinking to the bedrock, from twenty to seventy feet, or perhaps more.

The pay dirt averages two feet in thickness; the gold is coarse and worth $14 per ounce. Nuggets to one-half of an ounce in size are not uncommon. The largest I have seen during my stay there was three and one-fourth ounces. In January, 1892, there were about forty white men in the camp and about twenty Chinese. The Chinese had some claims leased—very few purchased—and were doing well. They have a Chinese supply store, but many prefer trading with white men. Both live together harmoniously. The miners were not very industrious, and took it easy. They make good days' wages by working on short shifts, striking frequently small rich pockets, resulting in handsome profits, such as $50 to $400 in a week's cleanup.

There is a good field for prospecting, as more than two-thirds of the gulch is yet undeveloped; but it requires some capital, because the dirt has to be hoisted and pumping is unavoidable. The gulch is about nine miles long, opening into the desert. The highest point—the summit—is 7620 feet and the mouth 4340 feet above sea level. Wood and timber are abundant.

Tule canyon is situated in the extreme southwest of Nevada, Esmeralda county, on the California State line (Inyo county), and at the head of Death valley, and can be reached by the C. C. R. R. from Carson City to the Mound House, to Candelaria, then by stage (twice a week) via Columbus, Fishlake, Palmetto, Pigeon springs to Lyda valley, about seventy miles staging; hence four miles more of good wagon-road. The accommodation is good. The Tule Canyon camp ever has been and is yet a sort of indolent concern. The miners make their living and seem not to care for anything more. Bob Robinson's store furnishes bacon, beans, tobacco and whisky in exchange for gold-dust, and nothing more is wanted. There is no hotel, no restaurant, no barber-shop and no saloon.

The Tule Canyon district has also strong, promising quartz ledges, but very little prospecting has been done on them. More attention was paid (1890–1892) to base metal veins. Several rich pockets were extracted and a couple of hundred tons of ore were shipped, rich in silver, but poor in gold. I. B. STORCH, M. E.

Working Phosphate Deposits.

A correspondent of *McPherson's Geological Record* says: The increasing demand for phosphate as a fertilizer gives special importance to all minerals of this class, phosphoric acid being an article of plant food which perhaps above all others should claim the farmer's most careful attention. It is absolutely necessary to the life and growth of plants. The soil is therefore very speedily exhausted of its supply and it behooves the farmer to carefully and continually return phosphoric acid to his soil, lest it become barren through want of this ingredient.

Peruvian guano, which in addition to phosphoric acid contains nitrogen, has been used in nearly every agricultural district in the United States and Europe. Also shell marl, which generally contains a small percentage of phosphoric acid, has been used in England for many years. In 1845 Professor Henslur recommended Cambridge coprolites or nodules, since which time deposits have been discovered in Norway, Russia, Germany, France, Spain and many other countries.

In 1867 the South Carolina deposits began to be worked, and in four years' time the annual production of land and river rock had reached 65,000 tons.

Although the existence of phosphate deposits in Florida had been known for many years, no regular shipment was made until 1888, since which time this industry has assumed vast proportions, and many millions of dollars have been invested in lands and machinery to carry on the business of mining. It is very difficult to define the area containing phosphate in Florida, as there is scarcely a county in the west half of the State where it does not exist either in the form of pebble rock or soft phosphate. In many places it is found near the surface covered with a slight overburden of sand, and in other places the rock crops out on the surface. These deposits seem to occur in a series of pockets. The contents of these pockets consist of phosphate rock in a variety of types, and are irregular masses weighing from a few pounds to many hundreds of tons. The laminated rock is very hard, more or less distinctly compacted in layers, sometimes with intersticces between the laminations filled with sand or clay. The streaks are of a white and salmon color in alternation; sometimes the salmon is replaced with a blue. The lamination illumination can in most all instances be distinctly traced. This last type is frequently found imbedded in clay. The lamination conchoided type is a hard boulder, smooth with polished exterior, solid and massive within, color cream white with irregular streaks of a darker color.

The land pebble is found mixed in with the sand and yields in many cases seventy-five per cent of pebble, the matrix in some cases being a white phosphatic clay showing as high as fifty per cent phosphate of lime.

There are many other types found throughout the State, but those named are the most frequent. The first three types named are in nearly all cases found in pockets, and have in a number of cases been worked to a depth of sixty to ninety feet. Most of the pebble deposits are found within a few feet of the surface, and in many cases I have found it over an area of several miles in extent. The mining of phosphate in Florida at the present time is one of the best paying investments in the State. Thousands of tons are shipped to England and Germany, and eventually Florida will supply the world with fertilizers.

Scientific Progress.

Aids in the Determination of Color Blindness.

A number of specially interesting cases of color blindness are dealt with in a recent article in the *Zeitschrift fur Instrumentknnde*, and conclusions are deduced tonching the diagnosis of color blindness, the classification of subjects so affected, and the system of color perception or the theory of tbe sense of light. For diagnostic pnrposes the use of the varions self-coutrolling methods are recommended, and proofs are addnced of the nnreliability of Stilliug's psendoisochromatic tables. Tbe anthor discnsses the following seven methods of examination: (1) spectroscope with micrometric adjnstable collimator-slit; (2) colored samples of wool; (3) colored pigment papers; (4) the objective spectrum; (5) colored flames; (6) tinted glass and combinations of gelatine sheets; (7) Stilling's tables. The resnlts obtained from the examination of ten cases (including snch special cases as hereditary, monocular and partial color blindness limited to the middle portion of the retina) give certain grounds for the statement that, as regards their color perception, human beings may be classed as acbromates, dichromates and polycbromates. Color-blind people shonld not be classified nnder snch simple conventional rnbrics as "red-green blind," etc. Sbould one color be wanting, observes the writer, it is not necessary that the counter-color should also be lacking; marked "displacement of complimentarism" often occurs. (In the above mentioned cases of color blindness, red and blne were complimentary.)

The anthor goes on to show that, in the strict sense of tbe word, tbere are no homogenons colors (provided that homogenons light is regarded as consisting in reality only of the rays of one wave length) for, on employing the nsual media for decomposing white light (prisms or frame and slit), a snperposition of the individnal wave lengths arises owing to the dispersion, and to the marked breadth of the slit in comparison with the size of the wave lengths. The inference drawn from this is that a marked sensitiveness of the eye to color is not caused by any one wave length, but by a certain kind of combination of several wave lengths. This, therefore, does away with the common idea of making pnrple an exceptional color. Purple is uot preseut in the spectrum as red and violet, being sitnated at the euds of the spectrnm, are not able to superpose their wave lengths; but if these uo longer visible (ultra?) red and violet rays be bronght to convergence, purple will result; and, on the other hand, if we gaze tbrongh a prism at a dark object on a light ground, one of the object's edges will be bordered with red-orange yellow, and the other with blne violet. Green, however, is conspicnous by its absence, as no snperposition can now arise between blue and yellow. Hence pnrple is just as much, and in the same sense, a component part of white light as every other color.—Opticiau.

Electric Registering of Chemical Action.

A novel use of electricity, wbich has been described to the French Academy of Sciences by M. J. Garnier, is that of keeping watch over certain chemical operations and reporting the successive stages reacbed. A mixture of nickel oxide and wood charcoal, for instance, was placed in an earthen tube, closed by two plugs of soft steel pressing against the mixture. The plngs were then connected up to an electric circuit, and the tube was heated in a small reverberatory furnace. The electrical resistance, at first high, gradually sank to zero, then began to increase, and finally became very high; the decrease in resistance, it is explained, being due to the gradnal reduction of the metallic oxide by tbe carbon, the completc rednction being indicated by the minimum resistance, and the final change resulting from the taking up of free carbon by the metal. In the commercial refining of metals it seems to be possible, by a convenient arrangement of ammeters and voltmeters, to determine tbe condition of the contents of a furnace at any moment and any distance.

Magnetic Properties of Asbestos.

Mr. A. C. Swinton writes: "In some recent experiments Mr. J. C. M. Stanton and I found that, employing a very strong electro-magnet, a piece of ordinary white asbestos mill-board, about 4x3x1-16 inches in size, and weighing one-half onnce, was easily lifted throngh a vertical distance of one and one-half inches, and when in contact with the magnet pole the asbestos board wonld support four onnces in addition to its own weight. Lnmps of hard asbestos, snch as are nsed in gas fires, as also pieces of soft asbestos cotton packing, were also strongly attracted, and when some of the latter was placed on the magnet pole and the cnrrent turned on and off, the individual fibers conld be seen in movement. Further, it is quite easy to permanently magnetize a piece of asbestos mill-board, when it will behave exactly as a magnet both in attracting and repelling a compass needle. The principal constituents of asbestos are stated to be magnesia, silica and alnmina, witb some oxide of iron. No donbt it is to the presence of the last-named snbstance that the magnetic qnalities are due. White asbestos is, however, nnderstood to contain bnt small traces of iron—mnch less tban the colored varieties—and consequently the degree to which it is magnetic seems surprising. In any case it may be well to warn experimentalists that asbestos is not a suitable substance to employ in connection with delicate instruments where any nnsuspected permanent magnetism might be prodnctive of serions error."

Germ Life in Ocean Depths.

Recent investigations of the chemical and biological condition of ocean water at great depths have gone far to supplement the work of the Challenger and similar expeditions. The Plankton expeditionary investigations proved tbat germ life capable of reproduction exists everywhere except at tbe greatest depths, being more prolific in the Canary, Florida and Labrador waters than in the nortb or sonth equatorial currents. Bacterial life has been fonnd at depths of 1300 to 3500 feet; and, cnriously enongh, the major portion seems to be of species requiring oxygen for their existence, a great number of which are phosphorescent. Mons. Delebecque has fonnd tbat in lakes tbe quantity of magnesia is constant at all depths and in all seasons, the supply being derived from the abrasion of the beds of rivers draining into inland lakes. Dnring the snmmer season micro-organisms are met with in abnndance at great depths, whereas they are present only in small numbers at or near the surface. Mons. Boutan has also been engaged in researches by which he has obtained photographs of animal and vegetable life at considerable depths, and these photographs are of great valne, as it has been found that living organisms found in deep waters cannot be brought to the surface for examination without a complete change taking place in their characteristics.

THE telephone seems destined to play an important part on the battlefields of the future. Experiments were recently made witb a bimetallic wire, made up of a core of steel snrrounded by a coating of copper. Reels carrying 10,000 feet of this wire can be easily carried by soldiers as a part of tbeir eqnipments. The entire apparatus necessary for a line one mile long can by the use of this wire be made to weigh only five and one-half ponnds. The iufinite and valnable nses to which snch an instrnment conld be applied will be obvious to every one.

Double Acting Cornish Plunger

Pumps twice as much water as the old Cornish pump and "only one-third the weight."
SPECIAL CONSTRUCTION OF STEEL for packing on mules, only one-twelfth the weight of the ordinary Cornish Plunger.

IMPROVED SINKING PUMP.

Bucket and clack changed under water, saving expense of putting down another pump when the bucket or clack gives out under water. Bucket gearing lasts six times as long as the old gearing.
First outlay one-third less and works with ten per cent less power, "paying for itself in one or two years, according to the price of fuel."

DEWEY & CO., 220 Market St., SAN FRANCISCO,
PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Mechanical Progress.

Electricity for Motive Power Purposes.

At the Belgian meeting of the Iron and Steel Institute a paper was read by D. Selby-Bigge on the applications of electric power, with special reference to works driven by electricity in Belgium. Particulars were given of the cost of production and distribution per unit of power delivered to consumers by different companies, and the author summed up the main advantages to be derived from electric driving in works as follows:

1. The concentration in one highly economical plant of the generation of power for the whole of the works, and great reduction in coal consumed per unit of work done.
2. Reduction in wages, owing to the very small number of officials required in connection with such a plant.
3. Transmission of the energy generated, with very trifling loss, to the different parts of the works.
4. Absence of main shafting, countershafting, pulleys, bearings and belts, and heavy cost of upkeep in connection therewith.
5. Absence of long lengths of steam pipes, and losses due to coudensation.
6. Absence of scattered and separate boilers.
7. Absolute control over the economical running of the works, owing to the self-indicating nature of electric motors and the immediate detection of any undue losses which so often occur in mechanical forms of power transmission.
8. Great economy in work of an intermittent nature and varying loads, a direct proportion between the indicated horse power of generating engine and work given out by motors being obtained.
9. Very small cost and size of foundations involved in works driven electrically.
10. Great facility for alterations and extensions, without any modifications being necessary to the original plant.—Manufacturers' Gazette.

Soldering Glass to Metals.

A process has been devised by some ingenious Frenchman whereby glass may be securely soldered to metals. It is said to be exceedingly valuable from its simplicity and the many important uses to which it may be put. The portion of the glass tube or other article that may be soldered is first covered with a thin layer of platinum. This deposit is obtained by brushing over the slightly heated glass a natural chloride of platinum, mixed with essential oil of chamomile. The latter is slowly evaporated, and when the white and odoriferous vapors cease to be given off the temperature is raised to a red heat; the platinum is then reduced and covers the tube with a layer of bright metal. Placing the metalized tube in a bath of sulphate of copper and connecting the tube to the negative pole of a battery of suitable energy, there is deposited on the platinum a ring of copper which will be malleable and very adhesive if the operatiou has been properly performed. In this state the glass tube, topped with copper, can be treated like a genuine metallic tube and soldered to iron, copper, bronze, platinum, or any other metal that can be united with the solder.—Age of Steel.

Steam Carriages.

Progressive France is ever doing its utmost to encourage the advaneement of science. Just now that country is much absorbed in the question of the propulsiou of carriages without horses. Recently a competition for prizes was held in Paris for the purpose of drawing out the results of the labors on self-propelling vehieles. A large number of carriages were entered, representatives of nearly every class of this sort of coutrivance being brought forward. The trials were for speed, comfort and utility. A long course over ordinary roads was laid out, and over this each contestant drove his machiue. Speaking of the results of the contest, the *Spokesman* says:

Vehicles driven by steam or petroleum made the ninety miles between Paris and Rouen over the carriage road recently with success. It was shown that, for certain purposes, and on roads of a certain degree of excellence, the horse is not the best motor. The steam carriage of the Count de Dion, carrying four persons, attained a speed of seventeen miles an hour, and averaged about ten miles an hour. A petroleum motor took the second plaee. The race has caused much attention to be given to improvements in the construction of vehicles of this kind. It is seeu that they are far from perfect. In appearance, as well as design, they need the development that can be obtained only by extended use. Carriage road motors have long been in use in this country and in Europe where roads are suitable, but their imperfections have not been sufficiently attended to. As at present made in England and Germany, road motors have broad tires and do not injure the roads. On the contrary, they are believed to benefit them, since they act like rollers in smoothing the surface.

The Essential Ideas of Most Foreign Rifles of American Origin.

Some time ago we published the statement that the German Mauser rifle was an American invention, and we are uow asked as to our authority for that statement, says the *Army and Navy Journal*. Those familiar with the facts are aware that Mr. Mauser, at the time the weapon having his name was invented, was a skilled mechanic in the employ of E. Remington & Sons, Ilion, N. Y., and that the first Mauser gun was constructed at the expense of the Remingtons, and uuder the supervision of their master mechanic. The Remingtons had an interest of one-half or more in the invention, but Samuel Remington, who for many years represented the company in Europe, had sueh an unfortunate experience of the German government's illiberality to inventors that he sold his interest in the gun to Mr. Mauser for $500. These facts fully justify our statement, referred to, that the Mauser is an American invention. The Lee rifle furnishes the essential idea of most, if not all, of the rifles now in use in European armies, with the exception of the improved Chassepot or Gros. It certainly exeites surprise in the mind of any one who is familiar with the history of small-arm invention to find our Government going abroad for its service weapon.

The kingdom of Swedeu and Norway, from one of whose subjeets we obtain our new army rifle, was the first foreign Government to adopt aud purchase an American breech-loader, the Remington. With proper encouragement from the Government our small-arm manufacturers might hold the field against the world. The design and essential idea of the breech-loader and magazine gun, wherever it is fouud, is American. The machinery used in the manufacture of modern arms in all foreign countries manufacturing their own arms is of American invention and in a large measure of American manufacture. The machinery in the armories of Germany was manufaetured at Hartford, Conn, and the German workmen were instructed in its use by Yankee mechanics sent to Germany for one or more years.

An electrie brake has been in use on a car of the Suburban Railroad Co. of St. Louis for several months. Its eonstruetion is a hollow magnet, made of coiled copper wire. In the middle, and free to move lengthwise, are two pieees of soft iron, the opposite ends of whieh are eonnected with the brake levers. When the coiled wire is energized, the two soft iron cores are moved toward each other and the brakes are applied. The brakes may be applied with full force at first, and let off gradually as the car stops.

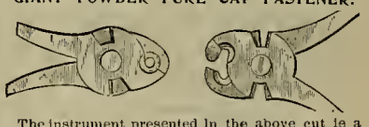
GIANT POWDER FURE CAP FASTENER.


The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.

Practical Treatise on Hydraulic Mining.
BY AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

LIGHTNING LARGEST **WELL MACHINERY** Works.
All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

VOLCANO.—Amador *Republican:* The Volcano Gold Gravel Mining Company intend to do something in the way of quartz mining. They have purchased a quartz claim on the Blakely ranch, situated between Volcano and Pine Grove, and have commenced the erection of hoisting works thereon. Seven men are employed. The property was prospected to a limited extent in early days, but has remained idle for many years.

A large number of new blocks have been placed alongside of the flume of the Volcano Gold Gravel Company's claim in Volcano basin, in readiness to be placed in position in the flume. This indicates that the property is to be worked to some extent the coming season, notwithstanding all the reports to the effect of its permanent suspension on account of the exactions of the debris commissioners for the construction of works for impounding tailings.

A man named Smith has bonded twenty acreas of the Clough ranch, near Volcano, for quartz mining purposes. The price is reported at $3000, one half of which has been paid. It is the intention to erect a ten-stamp mill, which even though the rock on the Clough ground should prove inadequate to keep it in steady operation, ought to prove frialy profitable for custom work.

The tunnel of the Clinton Consolidated mine at Wieland is being cleaned out. Negotiations are in progress for the sale of the property to a New York company.

Henry Zumalt recently had a quantity of of rock from his mine in Pioneer district crushed at the Gracey mill. It yielded, we are informed, nearly $10 per ton in free gold alone.

Freeman Clark has also had a crusbing of ore from his mine in the same district. We have not heard the result.

At the Hardenburg near Middle Bar everything seems to be moving along in a more prosperous manner than at any time since the present company took hold. The mill is kept running steadily. A winze is being sunk at the 800 level, which is to be put down 200 feet.

THE ZEILA OF JACKSON.—Amador *Ledger:* Repairs are to he made upon the Zeila mill and shaft during the fall but the exact date at which the work is to be commenced has not been decided upon.

THE STARBIRD OF JACKSON.—Work is being pushed forward at the Starbird, formerly the Stewart mine. A force of men are now employed cutting timbers to be used in the development work of the property. The three-stamp mill is kept running continuously.

Calaveras.

HEROLD QUARTZ MINE.—Calaveras *Chroniele:* The outlook for this property is better than ever. The winze from the upper tunnel has been sunk twenty feet deeper, making forty feet in all, and the vein has gradually improved in the quality of the ore. The vein is fully four and one-half feet of ribbon quartz, giving $20 per ton in free gold and carrying two and one-half per cent of high grade sulphurets. Four men are at work sinking the winze, 5x9 feet suffices to extract sufficient quartz to keep the mill crusbing ten hours each day. with two shifts in the lower tunnel about forty feet has been made since our last report, making a total length of 130 feet; 120 feet more is necessary to be run to reach the ore vein at the winze. A new lodging house has been erected on the property. Twelve men our on the pay roll.

Nevada.

MINING AT PHELPS HILL.—Nevada *Transcript:* Charles Phelps has for some time past been running a bedrock tunnel into his gravel mine at Phelps Hill, this side of Washington. He has got into the hill about 100 feet and has just entered the edge of what promises to be a very rich gravel channel. The prospects obtained from some of the gravel are highly encouraging and the indications are that Mr. Phelps will have a very valuable property when he gets his mine thoroughly opened. He intends to drive the tunnel 100 feet fartber, wbich he calculates will about take him across the channel. The gravel in the tunnel is the regular blue gravel. Years ago, before hydraulic mining was suspended, the same mine paid handsomely.

IMPROVEMENTS AT THE FEDERAL LOAN.—The Ingersoll drill and air compressor received here last Wednesday by the Federal Loan Mining Company, were taken to the mine Saturday. The new machine weighs four tons and is of the latest kind. It will be put in place without delay. Chris Weisenburger will do the necessary carpenter work and J. T. Day will lay the concrete foundation for the air compressor. The rock in the above mine is very hard and the machine drill will greatly facilitate operations. In a week or ten days the compressor will probably be in place and the air pipes extended into the mine and everything ready to start the drill to work.

A steam pump has been set to work at the old Live Yankee mine, ou the Grass Valley road, to pump out the water from the shaft. All the other machinery has been put in place and the new buildiug is about completed.

KATE HAYS HILL MINE.—Grass Valley *Telegraph:* It is with pardonable pride that the owners of the Kate Hays Hill mine are exhibiting some specimens of ore which came out of that mine. We were shown several pieces of rock from the 200 level of that once famous mine, and they were studded with gold. In years gone by, when this was a young mining camp, the Kate Hays cut an important figure iu the quartz miues of our district; but it has been idle for years, until lately, when a few enterprising spirits took bold of it and are now going to try to unearth the treasure which is known to exist beneatb tbe surface of that claim.

Plumas.

IMPORTANT MINING OPERATIONS.—Plumas *National-Bulletin:* Mr. A. W. Rugg, who is in several mining properties near La Porte, was in Quincy on business lately. He reported about three feet of snow at Onion valley as a result of the storm. However, it was very soft and fast disappearing.

Mr. Rugg is superintendent of the mining operations now being inaugurated at Cleghorn, on the middle fork of Feather river, about nine miles below Onion valley. He recently interested a number of San Francisco and Eastern capitalists with himself in au effort to develop a big mining property at the point named, and the necessary machinery, provisions, etc., are being laid in for the winter. They are now building a road from Onion valley down to tbe mine. The mining ground now under control of the company embraces about seven miles of the river bed and bars adjacent thereto.

It is the intention of the owners to prospect the gravel deposits by means of shafts at different points. For this purpose a large centrifugal pump, steel-lined, and with a capacity of 700 gallons per minute, has been ordered and is now en route; also two 22-horse power engines.

If the prospecting should result satisfactorily, a large, permanent mining plant will be put in next season and operations conducted on a large scale, employing a large uumber of men and making a lively camp of it.

Mr. Rugg is very favorably impressed with Plumas and Sierra as mining counties, and he thinks tbe industry is in its infancy yet.

Shasta.

NOTES.—Redding *Free Press:* It is stated that out of 600 feet of flume on Clear creek the Chinamen have taken out the enormous sum of $35,000 in gold.

Lowry, tbe old-time pocket-hunter, is reported to have found on Jackass flat, near old Horsetown, a nugget valued at $900. It was found in tbe gravel and a large piece of white quartz was adhering to it.

Mr. Chapman, below Horsetown, is bringing a line of pipe over 4000 feet in length across Clear creek from the Igo ditch, to work his claims. A house bas been built and other improvements made at Texas Springs preparatory to a winter's washing.

On Oregon gulch the shaft and incline being sunk on the contact between the sandstone and slate has now attained a deptb of 250 feet, with some 200 feet of a drift. Two feet of the blue gravel was found last week that paid a dollar to the pan. The gold was coarse and covered with a black coating. The promoters are jubilant over this find.

Mr. Marton, on the Igo road. four miles west of town, has buildings erected and wood cut for a winter's prospecting. He contemplates putting up a steam hoist and sinking 300 or 400 feet.

On Miller's ranch, at Lower Springs, Wm. P. Miller is hauling ore to his mill on Middle creek. Ore is also being bauled to the Hartman mine, owned by the same parties.

Jim Salee's men, at the Old Spanish mine at Upper Springs, are making good headway. Three shifts are at work and the 100-foot level sbows up fine. The ledge averages over four feet and all pay ore.

At Quartz Hill the open cut work being done is proving a source of considerable annoyance. The heavy rains deluge tbe workings, and the mine will have to be roofed over if the winter is a wet one. The mill is kept running steadily.

At Old Diggings, R. G. Hart reports his bonanza in tbe Texas Consolidated as still showing up fine. Great things are expected from this ore body. It is asserted that tbe Uncle Sam won't be in it with the Texas.

Tbe Central owners now propose to push development on their mine and to try and rival the Texas Consolidated. Mr. Anthony is kept busy getting timber and material for the winter.

At Iron Mountain, Mr. Hartman put four men at work on bis gold claims, and will start his arrastra.

The Lost Confidence mill is running through about eighty tons of ore as a daily average. Wood is being got in as fast as possible for a winter's run. The wood consumption is eighteen cords daily. They have 15,000 ounces of bullion ready for shipment; it is about one-third gold.

The Gladstone has been making efforts, througb its superintendent, Mr. Gray, to patch up the differences witb creditors and assume operations.

At Whiskytown, Hunt and James got the twenty-horse power engine of Sam Hill and put it to work bailing out shafts.

Peter Scberer's Tellurium and Cleveland ore is standing idle at present.

Mr. Samona, at the Gem, is getting ready for another winter's run. He proposes washing the entire top of the cave off and then milling the ore. The caved material is over seventy-five feet deep.

Siskiyou.

BALDY MOUNTAIN.—Yreka *Journal:* Baldy mountain is coming to the front as a mining camp. There are ten men at work, seven in the Columbian mine, operated by the Columbian Mining Co., and three in the Mabel mine, owned by W. A. Chamberlain. The Columbian mine has been in operation one year. They bave one tunnel in over 200 feet, besides two others in progress. They crushed 150 tons of quartz in the Scott Bar mill that went $12 per ton, and are now putting up a five-stamp mill on Mill creek, expecting to commence crushing by the first of next month. Chamberlain bas started a new tunnel on the Mabel mine, which will strike the ledge in about seventy-five feet, when he will have 300 feet of ore above the tunnel and liable to follow on the ledge tbe full length of his claim. Its vein is from one to ten feet in width, and is traceable tbree miles. The Columbian mine is on the soutb end of the ledge, the Mabel north of the Columbian, the Little Wonder north of tbe Mabel, and another claim north of the Little Wonder. Baldy mountain is on the divide between Mill creek and the Klamath river, nine miles from Scott Bar and eight miles from Oak Bar.

EMPIRE.—The Empire quartz ledge, near Honolulu, on Klamatb river, is now being worked under the management of the Garvey boys, and Frank Hegler superintends the quartz mill with prospects of good success. The mine now shows a ten-foot ledge, the quartz indicating the certainty of yielding from $10 to $15 or more per ton. Tbis ledge is likely to prove the most extensive in the county and to be of great benefit to this section, by giving employment to miners and putting more gold in general circulation.

ORO FINO.—At Oro Fino the Eastlick Brothers are greatly enlarging their ditch in preparing for extensive operations in hydraulic mining when the winter rains and snow storms commence for supplying water. They expect to take out more gold than ever by tbe improvement toward gaining a heavier supply of water for the giants.

Theodore Deming is busy making extensive preparations for successful hydraulic mining at Oro Fino during the coming winter, by piping water from Kidder creek to ground 100 feet higher than is now being worked in that extensive and rich mining district.

Tuolumne.

BEING DEVELOPED.—Sonora *Democrat:* The Carlotta mine near Arrastraville, the property of Wm. Sharwood, is now being developed by him and at present its appearance is very encouraging.

Ed and James Garrett of Bald Mountain, after working and toiling as few men ever toil, struck it rich last week in tbeir mine.

Jack Faxon, who owns the north extension of the Golden Gate mine, is negotiating with an Eastern company, which intends purchasing and putting up a mill. Tbe lead is two feet wide, and certified assays give percentage of sulphurets from 2½ to 3 per cent, and in value from $200 up to $2000 per ton. This is a valuable property.

W. H. Nevils, superintendent of the Gerrymander mine, reports that he bas developed a fine cbute of ore, prospecting well in free gold and assaying high in sulphurets.

The Dead Horse Consolidated mine has resumed hoisting operations, and soon it is expected tbat it will resume general operations. Lack of water bas heretofore retarded its progress.

S. S. Badger & Company, who are mining in the Stanislaus river at Central Ferry, have had very ill luck lately. Last week, after having built a flume fifteen feet long and four feet wide, and after getting down to tbe bedrock wbere the ground prospected well, the rains of Saturday raised the river and broke the flume. The company has spent a great deal of money thus far, and it is to be hoped that its resumption of the enterprise will be attended with large success.

Tbe Green mine, near Sugar Pine, is now being re-opened by Messrs. Ayres & Co. of San Francisco. Last week a rich chute was discovered near the end of the tunnel where it had been capped over with slate. The discovery is one of great value, for it has developed into great width, is very rich and the sulphurets are of a high grade. It will be recollected that this mine yielded $200,000 or more about ten years ago, and because of litigation operations were suspended. No doubt present operations will develop this property until a mine of great and lasting value is established. Present results prove it.

The Scott Bros., formerly of the Black Oak mine, have recently made wbat is thought to be one of tbe greatest discoveries of the latter day developments in Tuolumne. The discovery was made in a lode on Davis Flat, near the north fork of tbe Tuolumne river. The chute is described as being twelve feet thick and showing large pieces of gold across its entire width from wall to wall. It is not yet known bow long the cbute is, but it has already been uncovered a distance of fifty feet, and bids fair to run a long distance yet, as there is no diminution of its gold, its sulphurets and its great dimensions. The gentlemen have already had an offer of many thousands of dollars for the mine.

The shaft in the Rappahannock is down eighty-eight feet and still progressing with undiminished speed. Better than this, the main vein and all attendent matrix is increasing in dimensions and improving in appearance and prospects. It is also given forth by mining experts that this must ultimately become a great property, because, first, it bas fine ore bodies of its own, and, secondly, the ore bodies of the Rawhide mine—the wonder mine of the State—are pitching northerly into the Kappabannock mine. All the buildings at the above mine have been given a coat of metallic paint, and preparations are being made to erect the big mill.

Trinity.

DITCH CONTRACT COMPLETED.—*Journal:* Rouse, King & Co. have completed their contract for the enlargement of the Canyon creek ditch to the Hayes placer mine, Junction City, and, as usual with that company, have done a fine piece of work.

NEVADA.

Washoe District.

SAVAGE.—Virginia *Enterprise:* 950 level—The east drift from the new station is advanced six feet. On the 1000 level in north lateral drift started from the east drift, they continue to extract ore from tbe sill floor upward to the seventh floor. The south drift started from the face of the east drift was advanced ten feet; total length seventy-one feet; face is in clay and porphyry. During the week have hoisted sixty-one cars of ore. Car samples average $23.91 per ton. On the 1000 level the south drift started from the east drift tbirty feet from the south ore stopes they are stoping ore of fair grade. At a point eighty feet north of tbe south boundary, the west crosscut mentioned in last week's letter was advanced twenty feet and discontinued. On the 1100 level east and west crosscuts from the north lateral drifts were advanced twenty-eight and twenty-tbree feet respectively. Each of these crosscuts is in quartz of nominal value. The upraise from tbe west side of the north lateral drift has been carried up fifteen feet, following a stratum of fair-grade ore.

CHOLLAR.—The north drift, 450 level, has been repaired and retimbered for a distance of thirty-two feet since last report.

The north winze, 450 level, bas been sunk eleven feet for the week, and is now down twenty-four feet; the bottom shows a width of nine feet of ore, face samples of which go from $35 to $65 per ton.

We continue to extract a few carloads of fair-grade ore per day from the fillings and ground in places in the old stope on this level.

From tbat and the winze we have extracted during the past week 136 tons and 1700 pounds of ore, which bas been shipped to tbe Nevada mill for reduction, the average battery samples of whicb was $36.55 per ton.

UNION SHAFT.—On tbe 900 level of tbis mine the east crosscut from the north lateral drift, 450 feet northb of west drift, 1520 feet west of shaft, bas not been advanced during the week, owing to necessary repairs being made to the north lateral drift. The west crosscut from the Union Con. soutb lateral drift from west drift, 1520 feet west of sbaft, has been extended 24 feet during tbe week; total length 171 feet; face in clay and porpbyry.

POTOSI.—Have stopped west crosscut No. 5 from tbe soutb drift, 450 level, and started a south drift from main west drift, 550 level, at a point 500 feet west of the shaft.

The winze from the 450 level, 200 feet south of the north line, is down twenty-nine feet; the bottom is in porphyry with a streak of low-grade quartz eighteen inches to two feet wide running througb it.

Little or no progress has been made in the shaft at tbe croppings, due to timbering, etc.

S. N., M. & U. SHAFT.—East crosscut from tbe north lateral drift, 450 feet north of west drift, 1520 feet west of the shaft, 900 level, has not been advanced during the week, owing to necessary repairs being made to the nortb lateral drift.

The west crosscut from the Union Con. south lateral drift from the west drift, 1520 feet west of shaft, 900 level, has been extended 24 feet during the week; total length 171 feet; face in clay and porphyry.

SIERRA NEVADA.—The northwest drift, at a point 160 feet west of the moutb of the Leyton tunnel, is out 128 feet; advanced 41 feet during the week; face in clay, with stringers of quartz through it.

The east crosscut No. 1 from north lateral drift No. 2, at a point 140 feet north of intermediate tunnel, is out 68 feet; advanced 16 feet during the week; face in quartz and porphyry.

CROWN POINT.—There were extracted from openings in the 600 and 700 level stopes during the week 795 tons and 1750 pounds of ore, which has been shipped to the Mexican mill for reduction, the average battery samples of wbich was $9.60, of which $8.62 was gold.

SILVER HILL.—Tbe south drift from tbe winze, 45 feet below the 50 level, and 260 feet southwest from the shaft, has been advanced during the week 12 feet; total distance from the winze 32 feet; the face shows two feet of milling ore of fair grade.

WARD SHAFT.—The west drift from the Ward shaft, 880 level, bas been advanced 13 feet during the week; total length 1160 feet; face in soft porpbyry and clay. The flow of water has nearly ceased.

ALPHA.—During the past week have cleaned out and retimbered 20 feet of the shaft below the 437 level; total depth of shaft cleaned out and retimbered, 417 feet.

BULLION.—The west drift from the Ward shaft, 820 level, has been advanced 13 feet during the week; total length 1160 feet; face in soft porphyry and clay.

BELCHER.—Forty-eight tons of fair-grade ore have been hoisted during the week.

Hawthorne District.

GOLD.—Walker Lake *Bulletin:* W. S. Dickerson brought to town last week a small jar of gold valued at over $400. It was the results of hornings from the Pamlico. James Belzar and Mr. Dickerson are working the mine on a lease and have already taken out several thousand dollars.

Cherry Creek District.

GRIZZLY.—White Pine *News:* The Grizzly mine at Ruby Hill is to start operations again in the near future. We look for Mr. Jesse W. Fox, tbe manager of the company, next week. We are all glad that this mine is about to commence operations, and hope they will find a bonanza, as they deserve it.

Kennedy District.

A SYNDICATE TO TAKE HOLD.—Kennedy *New Era:* J. F. Wardner left here the first of the week, and his destination was unknown to but few, but it now becomes public that he has been receiving overtures from Eastern capitalists relative to forming a strong syndicate to get control of the principal mines of Kennedy district; and in pursuance to letters received last week, he hastened to Salt Lake—selected as a point of meeting—and is now in that city concluding terms whereby the syndicate, with the Imperial group as a nucleus, will begin operations in Kennedy on a gigantic scale and absorb all the smaller fry. The plan decided upon, as we understand it, is to increase the Imperial mill to sixty stamps, build a forty-ton pyritic smelter

and construct a tramway from the mines to the mill. We also understand that J. F. Wardner will continue as manager; and, upon the completion of the deal, and when final arrangements are consummated, which will take some time, he will return in time to rush the improvements to completion before the end of the year. We anticipate that, immediately upon his return, the force in the Imperial will be increased so that an excess of ore will be ready for the enlarged capacity of the reduction plants.

THE HIDDEN TREASURE MINE improves as the west drift advances. The upraise has made connection with the winze from the surface. Men are employed grading a road to the ore bin to allow teams free access. A shipment will soon be made to Salt Lake City.

IMPERIAL.—A visit to the Imperial mine convinces one that Supt. Dougherty has a force of men that is doing an immense amount of work. No. 5 tunnel is being advanced as rapidly as possible to facilitate the handling of the ore taken from the different stopes.

A CRAWFORD MILL TO BE ERECTED.—A Crawford mill may be erected in Kennedy in a few weeks. This mill is highly spoken of and may be just the thing needed for the treatment of the sulphuret ores of the camp. Post & Haven have five Crawford mills, reducing sixty tons of sulphuret ore daily, assaying $10 a ton in gold, in the Deep Creek country of eastern Nevada, and save $8 a ton, one man only on a shift being required to attend the mills, which are operated by a forty-horse power engine and boiler. A cleanup is made every fifteen days.

De Lamar District.

NOTES.—Piocho *Record:* Work on the mill building is progressing nicely. Although a greater portion of the lumber has not arrived, there is enough on hand to keep going several weeks.

The artesian well which is being sunk by the De Lamar Company, in Cedar Wash, has reached a depth of over 100 feet. At a depth of seventy-five feet a stream of water was encountered which rose within twenty feet of the surface. Water from the well was pumped at the rate of 2000 gallons an hour and has not decreased the quantity since it was first struck.

Tuscarora District.

NAVADO.—*Times-Review:* The crosscut on the 150-foot level has been extended seven feet. No material change.

BELLE ISLE.—North drift, east vein, 250-foot level, extended ten feet. South intermediate, same vein, has been extended six feet, showing good ore along the top. The stopes are yielding about as usual.

ARIZONA.

STRIKE IN THE HARQUA HALA: Phœnix *Herald.*—Mr. David Armstrong is in the city from the Harqua Hala mountains. The primary object of Mr. Armstrong's visit to Phœnix was to bring the glad intelligence to his partner, Mr. Frank Smith, that on Monday night the night shift on their property uncovered a three foot ledge of ore that means a fortune to them. The ledge has been traced for a thousand feet up the mountain and is free milling gold which will go from $150 to $500 per ton. Several pockets have been found in the ledge which will go over $5000 to the ton. It is an immense find and both partners are consequently jubilant.

Arrangements have been made with Mr. W. C. Davis of Goldeu wherby the ten stamp mill on his claim will at once be put to work on ore from the new find and bullion produced.

There is plenty of water and a large spring is located on the claim from which water will be piped to the mill and used to furnish power through a motor for the running of the mill.

At Sunset camp Mr. Chas. Prange has twelve men at work developing his property which is showing up nicely, the shafts are down about 140 feet and all in good ore. Hoisting works will be put up on Mr. Prange's return from St. Louis where he is now on other mining business.

MONTANA.

AROUND BUTTE.—*Inter-Mountain:* A number of well known Butte mining men have secured a lease on some valuable placer ground owned by Silas F. King, in the Pioneer district, about twelve miles from Drummond, and are now making the necessary arrangements to work it on an extended plan next spring. The properties are situated at the head of Deep creek, and some time ago were bonded for $150,000. Owing to the scarcity of water, however, the ground could not be worked at a profit. The mining men who have the properties now in hand have made extensive arrangements for working them. A mammoth pump and the necessary pipe have been ordered. This pump will be placed one and one-quarter miles from the placer grounds and at a point 700 feet lower. Mining men of this vicinity who are familiar with the property say that Henry Albertson and others who are interested in the properties will net anywhere from $2,000 to $5,000 a day after they get everything in working order.

MINING NOTES.—The new shaft of the Mountain Con. No. 2 has reached a depth of 700 feet. Sinking will be continued another 100 feet, when the old working of the Mountain Con. No. 1 will be connected at the 800-foot level.

It is rumored that a change of management took place recently in the Jay Hawk Mining company at Ponsonby.

It is said that the Anderson mine in the Ground Squirrel district will shortly pass into the hands of the Butte & Boston company if satisfactory terms can be agreed upon.

Devine & Co., who are working the Odin, in Dublin gulch, west of the Never Sweat, have completed developing the shaft and are now cross-cutting for the ledge at a depth 150 feet. The lessees also have a bond on the property for $50,000, which they hope to raise.

The Parrot company, which a few years ago was the only company using the Bessemer converter for copper, has numberless imitators now all over the world. New refineries worked by this process are now quite common in the east.

John Alix, Leon Dussault, Joe Gosselin and R. G. Robinson have secured a lease on the Dennise A and Adelaide quartz claims, south of Rocker, and will at once commence work. These properties are owned by A. J. Marchand & Co., but very little development work has been done on them.

OREGON.

AROUND JACKSONVILLE.—*Times:* W. L. Weatherred of Portland, a stockholder in the Annie Mining Co., has received notification of the sale of the mine to San Francisco capitalists, the consideration being $61,800.

The Sterling Mining Co. has finished cleaning up last season's work and will resume piping at an early day. It is stated that they have done exceedingly well during the past year, gold dust to the amount of nearly $100,000 being the result. It is probably the best placer mine in Oregon.

The coming year promises to be the best in the last quarter of a century for the mining interests of southern Oregon. Capitalists are becoming interested in our mines, and the more they investigate the better they like the prospects. The developments in quartz mining for the past few months have demonstrated the fact that the mineral deposits of this section are in ledges and not mere pockets.

Two practical miners—Mattern and Sackett—have been at work in a prospect tunnel, on land belonging to G. F. Billings, about a mile north of Ashland, in a place which was abandoned by an Ashland company last winter, after it had been driven more than 100 feet. The old company ran by the ledge they were looking for without knowing it. Mattern and Sackett found a five-foot fissure, and in their prospect drift upon it have taken out considerable pay rock. Last week they sent four and one-half tons of the ore to the Selby smelter, at San Francisco, and their returns showed that it yielded, gross, about $1500, and netted them here, above all charges, $1290.98. They are believed to have a true fissure vein and a valuable property.

BROWNTOWN NOTES.—Rogue River *Courier:* Griffin struck some of the richest rock in his new tunnel the other day that has ever been seen in this section. Some of it will go from $3 to $4 to the pound weight, or from $6000 to $8000 to the ton, and you can scarcely look at a piece of it without seeing free gold.

Three men—new-comers from Washington—have been prospecting in the same range south to the California line and have found the southern extension of the same ledge covered with shale and cased in hard slate. The ledge, where opened, is from two to three feet in width and prospects well in free gold. The season is now too far advanced for them to do much more than prepare for an early spring work.

Removal.

The Fort Wayne Electric Corporation, Frank G. Cartwright, Pacific Coast Agent, has removed its office from 41–43 Stevenson St., to No. 35 New Montgomery St.

The Annual Convention

OF THE

California Miners' Association

WILL BE HELD IN

SAN FRANCISCO,

MONDAY..... November 19th, 1894.

Questions of importance to the Quartz, Drift and Hydraulic Mining Industry in California will be considered, and County Mining Associations are requested to appoint delegates at once.

Our Senators and Congressmen are expected to be present at this Convention and the Miners of the State will have an opportunity of bringing before them such matters as affect the welfare of the Mining Industry.

Place of meeting will be published later.

EXECUTIVE COMMITTEE CALIFORNIA MINERS' ASSOCIATION.

By WM. C. RALSTON, Secretary.

THE JONES ROCK DRILL

IS THE

Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

Electrical Progress.

Interesting Electric Welding.

A formidable rival to the big steam shovel in the curiosity of the Cleveland public at present is the electric welding apparatus iu use on the street-car lines. It is rcally an interesting as well as an important machine.

Two pieces of steel on either side of the rail between the ends of the rails about three inches one way, two inches the other, and an inch and a half thick, shaped to fit the web of the rail and the flange, are placed exactly opposite each other. A heavy movable swedge, with jaws on each side of the rail, controlled by an immense screw in the hand of the foremau, holds the two pieces of steel up tight to the rail. A powerful alternating curreut of electricity is applied to each piecc of steel on the sides of the rails. Iu five minutes the steel and the ends of the rail are red hot; in ten minutes they are glowing red hot; in twelve minutes they sparkle and arc at a welding heat, as if placed under the blast of a melting furnace; a little more application of power by the great jaws on either side of the rail under the intense heat and the steel is pressed into space between the ends of the rails, aud the weld is completed. The current is withdrawn, the rail begins to cool, the big compress is moved back, the men with chisel and hammer clip off the cinders or the scales, and the big rails, seven inches in height, are welded together and make one continuous solid piece of steel.

Cost of Street Cars.

Six years age the price for a complete trolley car, including two motors, was $4500. A year and a half thereafter it dropped to $3500; two years ago it was $2850; one year ago it was $2000. With the decrease in price the equipment has greatly improved iu quality and efficiency. The average price of the same apparatus to-day is between $1000 and $1200. A recent order for a single car was competed for by seven coiccrns. All the companies paid traveling expenses of representatives. Bids ranged from $1500 to $640. It was let to the lowest figure. Iu January, 1890, there were 161 electric railways in operation and iu process of construction. Iu January, 1892, this number had growu to 281. To-day there are 500 cities using electricity. Many of them are traversed by great mileage. This reduction in price, in the face of an increase in the demand, has been due to competition and a reduction in the cost of manufacture, accompanied by an increase in the quality of the product. The profit on a car sold in 1892 at $2850 was greater than the same goods sold in 1888 at $4500. We do not believe that any company can make and sell satisfactory car equipments at a profit for $640. If this competition keeps up, as it probably will for some time, we do not see how profits are to be made unless a wider market than at present exists is developed. It cannot be hoped for a growth during the next six years so marvelous as that which took place between 1888 and 1894. Nevertheless it is believed that much can be done to widen the field of consumption of electrical apparatus of all kinds, especially railroad equipment.—Electrical Review.

A DEVICE for connecting a movable vessel with the shore by a cable capable of transmitting 200 horse power is described and illustrated in the London *Electrical Review* of a recent date. The cable is connected to a well-insulated movable joint at the anchorage of the vessel, wheuce connection is made with the vessel. The intention was to use it with a wave motor, but it can be used also for lighting lightships electrically from a generating plant on the shore.

A MAN of Tennessee, says the *Electrical Review*, has been turned into a colored man by a stroke of lightning. A writer in the New York *Sun* says that all the dynamos of New England must cease running for forty-eight hours to stop the drouth in that section by keeping electricity from floating upward aud dissipating humidity. With electricity descending and transforming Caucasians into Africans, and electricity knocking out Jupiter Pluvius, one may venture to remark that electrical wouders never cease.

THE portable electric lamp has come into frequent use in London, and it now forms part of the regular equipment of the omnibus inspector, who finds it of the greatest service in the performauce of his night duties.

Flying Machines.

I am quite frce to admit that the navigation of the air is beset with a great many dangers; it is also very dangerous to make high explosives or fire large guns, but it is iufinitely more dangerous to be within the range of the enemy's guns. What I propose to do is to enable one to assail an enemy from a distance greater than the enemy will be able to strike back with the most powerful gun in existence. So I think it would be quite as safe for combatants to employ my means of assault as to employ the preseut means, which necessitate their approaching nearer to the enemy and having to receive his fire. I do not know that any one has ever inventcd a system of warfare which is perfectly safe. It is known now to be possible to make a machine that will actually fly at a very high velocity; so nothing remains to bc done except to learn how to manœuvre it. In view of the decided advantage which the flying machine would give its possessor over an enemy, I do not think that in case of war European nations would hesitate to employ them, cven if one-half of the meu navigating them were killed. At the preseut time uo difficulty is ever found in getting volunteers to make a torpedo boat attack upon a mau-of-war, something which is iufiuitely more dangerous than navigating a flying machine would be, as the latter might be painted black and make its attack at night or in a fog, when it would be quite impossible for the enemy to strike back. War, at best, is a dangerous game, and those entering upon it are playing with dangerous instruments, whether they are guns, dynamite or flying machines. —Hiram S. Maxim.

The Velocity of Express Trains.

The express traius between London and Edinburgh travel on an average about forty-three miles an hour, including stoppages, or fifty-oue miles an hour without including stoppages; to attain this rate, a speed of sixty miles an hour, or seventy where the road is favorable, is adopted midway between the stations. A speed of seventy miles an hour is almost equivalent to thirty-five yards per second, or thirty-five yards between two beats of a common eight-day clock. All objects near the eye of a passenger journeying at this rate will pass by his eye in a thirty-fifth part of a second, accordiug to Dr. Lardner, aud if thirty-five stakes were erected at the side of a line, a yard apart, they would not be distinguishable oue from another, and if painted red they would appear collectively as a continuous flash of red color. If two trains with the above velocity passed each other, the relative speed would be seventy yards per second, and if one of the trains were seventy yards loug, it would flash by in a single second. Supposing the locomotive which draws such a traiu to have driving wheels seven feet in diameter, these wheels would revolve five times in a seeond, aud the pistons would move in the cylinders ten times in a second, and as there are two pistons which act alternately, there would be twenty puffs or escapes of steam in a second. Such a locomotive speed is nearly equal to one-fourth of that of a cannon shot from a gun.

RUPTURE!

IT has been considered by the medical profession that heroia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

Selby Smelting and Lead Company,

416 Montgomery Street, San Francisco.

Gold and Silver Refinery

—AND—

Assay Office.

HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.

Manufacturers of

HEALD'S

Business College,

24 Post Street, - San Francisco

FOR SEVENTY-FIVE DOLLARS

This College instructs in Shorthand, Type-Writing Bookkeeping, Telegraphy, Penmanship. Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. Send for Circular. C. S. HALEY, Sec.

INVENTORS, Take Notice!

L. PETERSON, MODEL MAKER,

226 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential*.

John Taylor & Co.

Importers and Dealers in

Assayers' Materials,

Mine and Mill Supplies.

Also Chemicals, and Physical, School and Chemical Apparatus.

63 & 65 First St., Cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.Co BATTERSEA

Having been engaged in furnishing those supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Deoniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—GOLD AND SILVER ORES.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whierof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1893. Price $1.00 postpaid. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bisuuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is displaced by new matter.

Price, postpaid, $1.75. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.

Stamp Cam.

Practical Information.

Japanese Lacquer.

The famous varnish so extensively employed by the Japanese for lacquering various articles of furniture and small ware is obtained from a tree known to science as *Rhus vernicifera*. This varnish tree, which is called *urushi-naki* by the Japanese, grows to a height of about thirty feet, and at the age of forty years its trunk is forty inches in diameter. It reaches its greatest perfection in its eighteenth year, and then produces its largest yield of lac or varnish. The lac tapper carries a bow-shaped knife with which he cuts a two-millimeter gash in the trunk of the tree, and he then draws the point of the knife through the cut again in order to remove any chips formed by the first incision. This cut is made low down. On the opposite side of the trunk, a little farther up, he makes a second cut, and then on this side again, and so on, until he has made from six to ten incisions. After he has operated thus upon about a dozen trees, the tapper returns to the first tree and collects the fluid that has oozed from the cuts, which, at first milky white and thick, becomes, through exposure to the air, first dark brown and finally black; this crude lac is called *ki-urushi*. The tree is hacked in this way for from sixty to eighty days, until it dies. It is then cut down, and the wood is chopped up and put into hot water, which extracts the last remnant of the liquid, amounting to not more than half a pint. This forms the poorest quality of lac. The lac is purified by filtering it through cotton stuff, grinding on a paint slab, mixing with water, and then evaporating the latter by heat. The finer sorts are bleached in shallow dishes in the sun. There are about twenty different kinds in the market.—Lumber World.

Digestibility of Foods.

Animal foods, such as meats, fish, eggs and milk, are rather more digestible than most of the vegetable foods, although bread made from ordinary white wheat flour is very easily and completely digested. Bread from whole wheat flour, or that from which only part of the hull of the grain has been removed, is not so completely digestible, but is decidedly healthful for some people in aiding the passage of the food through the intestines.

There are great differences in people in respect to their power for utilizing different kinds of food. Milk is one of the most wholesome and digestible of foods, and yet there are people who cannot endure it. Late research makes it probable that in the changes which milk undergoes in the body injurious compounds are sometimes formed, and that this is the reason why milk does not agree with some people. The case is the same with eggs, with certain fruits, as the strawberry, and indeed with many different food materials. Hence it may be literally true that "One man's meat is another man's poison." But while there are exceptions, the general rule holds good that for ordinary people with good powers of digestion and assimilation, the nutritive values of the ordinary standard food materials are measured pretty accurately by their chemical composition, and that the right mixtures of food are those which furnish the nutrients in the proportions demanded by the body.—Prof. W. O. Atwater.

An Illustration of Power.

If it were possible, says the *Polytechnic*, to place 300 oars on each side of the ocean steamer Campania, making 600 oars altogether, each worked by three men, there would be 1800 men at work at one time. As they could not work continuously for twenty-four hours, but only for a total of eight hours for each man, divided into four watches, it would be necessary to have a crew of 5400 men to man the ores. If six men could develop one horse power, the total horse power developed by the 600 oars handled by 1800 men would be but 300, as against 30,000 in the Campania, or the same power would require the employment of 180,000 oars and a crew of 558,000 men to manipulate them.

Curiosities About Wood.

The strongest wood which grows within the limits of the United States is that known as "nutmeg" hickory, which flourishes on the lower Arkansas river. The most elastic is tamarack, the black, or shellback, standing not far below. The wood with the least elasticity and lowest specific gravity is the ficus aurea. The wood of the highest specific gravity is the blue wood of Texas and Mexico. The heaviest of the foreign woods are the pomegranate and the lignum vitæ; the lightest, cork. The tensile strength of the best known woods is set forth in the following: Ash, 14,000 pounds; beech, 11,500; cedar, 11,400; chestnut, 10,500; cypress, 6000; elm, 13,400; fir, 12,000; maple, 10,500; American white oak, 11,500; pear, 9800; pitch pine, 12,000; larch, 9500; poplar, 7000; spruce, 10,200; teak, 14,000; walnut, 7800; willow, 13,000; lance, 23,000; lignum vitæ, 11,800; locust, 20,500; mahogany, 21,000; maple, 10,500.

The weight in pounds per square foot (without fractions) of the well known woods (dry) is as follows: Butternut, 25; cedar, 35; cherry, 44; chestnut, 38; cork, 15; dogwood, 47; ebony, 83: box elder, 43; elm, 41; blue gum, 52; water gum, 62; white hickory, 49; shellbark hickory, 43; holly, 47; juniper, 35; lancewood, 45; larch, 34; basswood or linn, 37; mahogany, 66; hard maple, 46; white maple, 34; mulberry, 35; white oak, 53; persimmon, 44; pear, 41; pitch pine, 41; red pine, 36; white pine, 34; yellow pine, 33; plum, 49; poplar, 33; quince, 44; rosewood, 45; sassafras, 30; spruce, 31; sycamore, 38; tamarack, 23; black walnut, 41; white walnut, 32; the willows, from 30 to 36; and the yew, 49.

Four hundred and thirteen different species of trees grow in the various States and Territories, and of this number sixteen, when perfectly seasoned, will sink in water. These woods of high specific gravity grow mostly in the arid regions of New Mexico, Arizona and Nevada.

It is said to be probable that a large number of German soldiers will be equipped with portable electric batteries weighing about half a pound. A small lamp goes with the battery, and the invention will be of great value to the men employed about powder magazines. The batteries are also to be used for signaling from balloons at night, and can be fixed to the helmet when the men have to dig trenches after dark.

Market Reports.

The Markets.

Silver in October.

The following shows the daily prices of silver per ounce in New York and London during the month of October:

Date.	New York. (Cents.)	London. (Pence.)
1	63¼	29 3-16
2	62⅞	29
3	62¾	28 15-16
4	63	29
5	63½	29¼
6	63¾	29 5-16
8	64⅛	29 9-16
9	63¾	29⅜
10	63½	29 3-16
11	63¾	29 5-16
12	63¼	29 1-16
13	63¼	29 1-16
15	63⅜	29 1-16
16	63½	29⅛
17	63½	29⅛
18	63¼	29⅜
19	63⅛	29
20	63	28 15-16
22	63	28 15-16
23	63¼	29 1-16
24	63⅜	29⅛
25	63⅜	29⅛
26	63⅞	29¼
27	64	29 5-16
29	63¾	29¼
30	63⅝	29 3-16
31	63⅝	29 3-16

The London quotations are per ounce 925 fine and 1000 fine New York. The highest and lowest prices for the month were as follows:

	London.	New York.
Highest	29 9-16d	64⅛c
Lowest	28 15-16	62¾
Difference	⅜d	1⅜c

In September the difference between the highest and lowest London prices was 1 1-16d, and 2½c in New York.

In September the London market opened at 30¼d and closed at 29 3-16d. The highest price during the month was 30½d. The New York market opened at 65¾c and closed at 63¼c, the highest being 65¾c.

The highest and lowest prices monthly compare as follows:

	New York		London	
	Highest.	Lowest.	Highest.	Lowest.
January	69c	66¼c	31¾d	30¼d
February	66⅝	59¾	30 11-16	27⅛
March	60¾	*58¾	27⅝	*27

Mining Share Market.

SAN FRANCISCO, Nov. 1, 1894.

Though last week closed with considerable quietness in the local mining share market, there has been some activity and strength manifested during the latter part of this week.

News has been received that the Con. Virginia winze has reached the 1750-foot level, and that further siuking will be suspended until connection has been made by drift between the old openings west of the C and C shaft and the new ore body. They are also preparing to drift south in the ore body from the bottom of the winze.

Three more bars of bullion have been shipped from the Consolidated California and Virginia mine to the Carson Mint. The value of the same is $17,086.95, of which $10,000 is gold and the balance silver. The total shipments of the month thus far reported are $46,-792.68, but nearly $100,000 more will come before the monthly run is over. The increase of the gold in the bullion this month is remarkable.

At the annual meeting of the Alpha Con. Mining Company 85,585 shares were represented, and the old directors and officers were re-elected, with Charles Hirschfeld as president; A. K. P. Harmon, vice-president; Charles E. Elliott, secretary, and A. C. Hamilton, superintendent. There was $2452.95 in the treasury October 1st.

The following illustrates the changes of the week:

Coast Industrial Notes.

—Steady progress is being made on the extension of the Lone Pine canal, Inyo county. The work around the point of the Alabama hills is necessarily slow, but water for irrigating the valuable country around Lone Pine will be flowing through the ditch before spring.

—The spars that were lost in the breaking up of the Coos bay raft about a year ago are still being picked up along the beaches of Del Norte county, says the *Record*. A large number were gathered up along the beach above Point St. George and dumped into Lake Earl and a raft made up and towed down to the Lake Earl mill, from which place they are being hauled to this place over the railroad.

—There are now twenty-two teams engaged in hauling freight from Nevada City to different places above, says the *Transcript*. Much of this freight is for Sierra county and consists of winter stocks of goods for the merchants in that section. There has been more freight sent up country this season than for any like period during the past ten years, and more mining machinery has been hauled than ever before in one season.

—On account of the slowness with which the silver-lead ores are flowing into the smelters in the valley, the Germania (Utah) has been forced to blow out one furnace and its capacity is now being reduced to a single stack. This latter is of usual size, however, and will be able to handle nearly three-quarters of the amount of ores formerly treated by the two stacks. The owners of the other two smelters are also complaining of a shortage of ores of all classes, and unless there is a change for the better in the very near future others of the stacks will of necessity be blown out.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCTOBER 23, 1894.

528,059.—SASH BALANCE—W. R. Abrams, Los Angeles, Cal.

527,942.—FIRE LADDER—A. B. Cairnes, San Diego, Cal.

528,127.—CIRCUIT CHANGER — Hunter & Lough, Seattle, Wash.

527,991.—PADDLE WHEEL — Jos. Jacobs, Nevada City, Cal.

527,997.—LEAF TURNER—H. Kramer, S. F.

527,798.—MARINE PROPULSION—J. S. Martin, Snohomish, Wash.

527,868.—AUTOMATIC DUMP—C. D. Matheny, Seattle, Wash.

527,803.—PENCIL SHARPENER — J. C. McCollum, Los Angeles, Cal.

528,105.—GAS ENGINE—H. B. Migliavacca, Napa, Cal.

527,872.—BED CLOTHES HOLDER—Carrie E. Muller, S. F.

528,628.—BICYCLE STAND—F. H. Pierce, San Jose, Cal.

527,905.—OLIVE MILL—Toulouse & Delorieux, S. F.

527,911.—CLOTHES PIN—W. D. Watkins, Yoncalla, Or.

529,917.—PIPE WRENCH—J. D. Wilson, San Diego, Cal.

23,733.—DESIGN FOR LAST—N. Bier, Salem, Or.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

EXTENSION FIRE LADDER AND TRUCK.—A. B. Cairnes, San Diego, Cal. No. 527,942. Dated Oct. 23, 1894. This invention relates to extension fire ladders and trucks. The object is to provide a ladder which is capable of being raised to any desired angle between the horizontal and the perpendicular, and which may be extended to any distance practicable for the number and length of ladders connected together; a truck upon which said ladders are mounted with a mechanism whereby they are raised and extended; and an attachment for carrying a quantity of hose in addition to the extra ladders, without raising the frame of the truck so high as to make it top heavy. The invention includes a frame mounted upon wheels having rack bars extending along its sides, a ladder having a shaft extending across its lower end with pinions adapted to engage and travel upon the rack bars, and a means for rotating said pinions and retaining the foot of the ladder at any point in its advance; fulcrum rods having one end connected with the rear of the frame, and the other end with the sides of the ladder whereby the ladder is raised to any desired angle by causing its foot to approach the rear of the supporting frame; a ladder slidable in guides upon the main ladder; sprocket wheels mounted upon shafts at opposite ends of the main ladder, a chain passing around the sprocket wheels having its ends connected with the second ladder whereby the latter is caused to advance within its guides, and a third ladder slidable upon the second one with a rope connected at one end with the top of the first ladder and the other with the bottom of the third ladder and passing around the pulley upon the top of the second ladder so that it is advanced and extended while the second ladder is being extended. Stop pawls are fulcrumed to the foot of each movable ladder, adapted to engage the rounds of the ladder below to prevent the ladders from slipping down in case of a ident.

FEATHERING PADDLE WHEEL. — Joseph Jacobs, Nevada City, Cal. No. 527,991. Dated Oct. 23, 1894. This wheel is one of that class in which the driving blades are adapted to be successively turned from the plane of rotation of the wheel to a plane at right angles thereto. The wheel consists of a body composed of a metallic skeleton filled with wooden pieces, leaving openings near the wheel rim and covered on either side by metallic plates formed with openings in their outer edges, and a series of driving blades having radial shafts pivoted in the wheel rim and provided with cross arms adapted to be acted upon by fixed cams to turn the blades into and out of action, the arms playing in and out through the openings in the wheel plates. This wheel, by reason of its general construction, combining lightness with strength and the removal of all causes tending to offer resistance, and by reason of the positive and quick action of the means for turning the driving blades, is especially adapted for complete submergence, and is particularly useful for tugs, in towing boats on canals, and for the boats themselves, as the banks are not washed or worn by the slight disturbance of the water by the wheel.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

Notice of Assessment.

GARNER CONSOLIDATED GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Mokelumne Hill Mining District, Calaveras county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of October, 1894, an assessment, No. 1, of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 56, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of December, 1894, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 27th day of December, 1894, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, 309 Montgomery St., Room 56, San Francisco, California.

FOR SALE.

Two Mines of Free Milling Gold Ore.

For particulars address JAMES A. SCOTT, Reno, Nevada.

The Russell Process.

For information concerning this process for the reduction of ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,

Park City, Utah.

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.

Price $6.00 postpaid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

NEW METHODS. **STORAGE BATTERIES.** NEW RESULTS.

THE HOUGH STORAGE BATTERY opens a new era in electrical development. We are now prepared to fill orders for complete plants for lighting or power. Residence lighting now an economical success. Stores, warehouses, mines, mills or street railways at reduced prices. Estimates furnished. Correspondence solicited.

MANUFACTURERS OF

Johnston's Concentrator, **Bryan Mills,**

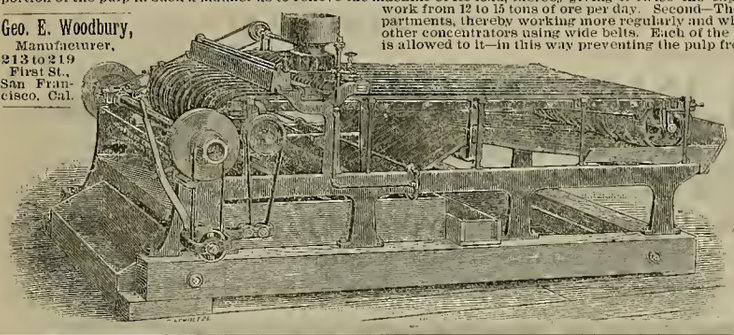
Challenge Ore Feeders, **Air Compressors,**

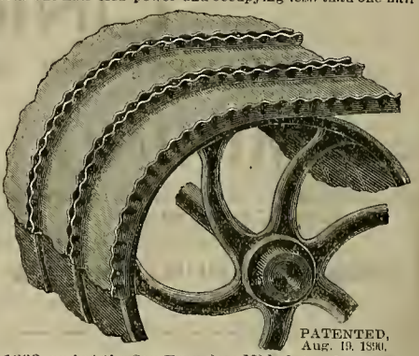
MINING, MILLING, PUMPING and HOISTING PLANTS.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 213 to 219 First St., San Francisco, Cal.





PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1894.

Natural Soda in California.

California is one of the few localities in the United States where natural soda is found. The geographical occurrence of this substance in the United States is principally confined to the arid regions of the Great Basin, especially to the soda lakes near Ragtown, Nev.; Mono lake, Mono county, and Owens lake, Inyo county, Cal.; and Albert lake, Or., and to many dry deposits and incrustations in the same region. A full chemical discussion of the nature of natural sodas and their technology, together with numerous analyses of the waters of the soda lakes and dry deposits, are given by Dr. T. M. Chalard in Bulletin No. 60 of the U. S. Geological Survey. The lakes, as shown by Messrs. King, Hague (40th Parallel, II) and Russell (Eighth Annual Report and Monograph XI, U. S. Geological Survey) are, for the most part, the residues left by the evaporation of larger bodies of crates, the shore lines of which can be traced at considerable distances, sometimes several hundred feet above the present beaches, showing that the old lakes covered wide expanses of the present desert.

The concentration by evaporation of the waters of the former lakes has increased the proportion of their mineral salts, and sometimes this concentration reaches the crystallizing point, when the sodium carbonate appears as a white incrustation on the surface and shores of the lake. The origin of this salt is explained by the geology of the region where it occurs, which is given in the reports above referred to. Mono and Owens lakes, in this State, are outside the great hydrographic basin of Lake Lahontain. Professor Russell describes the geography and geology of Mono lake in the Eighth Annual Report of the U. S. Geological Survey. Its hydrographic basin has no outlet, but streams and springs feed the lake, and the only escape for the water is by evaporation. The ancient shore lines can be traced far up on the sides of the Sierra Nevada, which formed the western shore of the ancient lake. There are springs in the bottom of the lake and near its shores. They are especially abundant near the base of the mountains—the seat of former orographic movements—and a belt of hot springs extends along the range for hundreds of miles. Just south of the lake is a series of volcanic cones known as Mono craters, so that the locality is one of former volcanic activity. The high saline contents of this and other lakes is due to the gradual concentration of its own water supply.

THE better a "prospect" is developed the better prospect there is of disposing of it. Men who find a claim, dig a twenty-foot hole, get out a ton or so of rock and then sit down and wait for some capitalist to come along and buy it are apt to wait for some time. Capitalists are not buying that sort of a "mine." In fact, there is nothing to show an intending purchaser under such circumstances. The "work your own diggings" principle is a pretty good one to bank on, and will win every time if the claim has any merit. Of course, ordinary prospectors are generally unable to sink a shaft several hundred feet deep, run drifts and put up machinery, but they can do enough work on their claims to make some kind of a showing, even if it does take time. Gold mining properties, both large and small, are in such demand these days that it seems foolish to let claims lie idle with only twenty-five or thirty-foot shafts on them. A reasonable amount of development work is expected, even on prospects, by men who are asked to examine them with a view to purchase.

THE McLEWEE IMPROVED AUTOMATIC SAFETY WATER GAUGE.

Automatic Water Gauge.

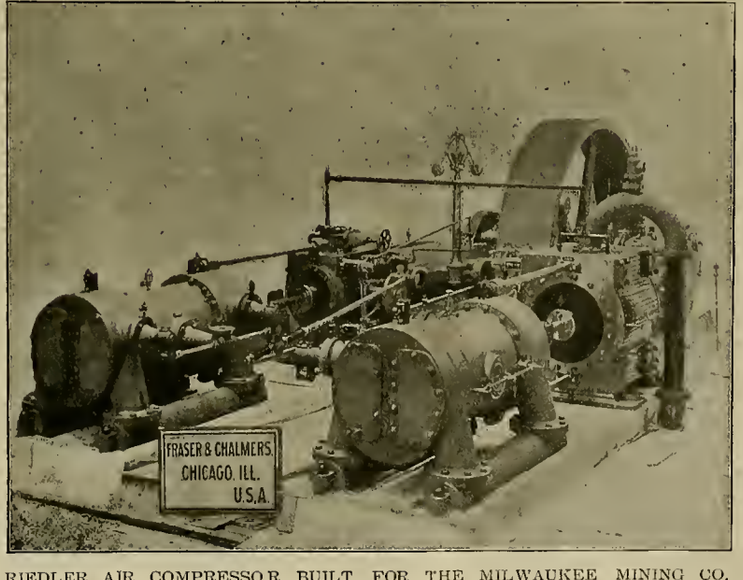
The device illustrated on this page—The McLewee Improved Automatic Safety Water Gauge—is coming into very general use by Eastern engineers, but has only recently been introduced on this coast. It is designed for locomotive, marine and stationary engines, and the claims made for it are that there is no breakage of glass, no stuffing of boxes and no leaking. A mica shield or casing protects the glass from air currents or accidental spattering by cold water. It also prevents the glass from flying in case of breakage. It may be quickly removed or replaced by simply turning the thumb-nut locking device at top and bottom, as shown in cut; the upper end of the shield being open and the lower part closed. The packing at the top and bottom of the glass consists of vulcabeston gaskets, arranged so that the pressure of the packing is all against the end of the glass. The latter does not come in contact with the metal at any point.

To put in a glass, which requires less than a minute, the hollow glass shown in section on the upper connection is screwed upward on the nipple, the glass is inserted, and the nut screwed firmly down, making an absolutely steam-tight joint.

The upper gasket rests in a collar, which is kept from turning with the nut by faces on the end of the nipple, and the latter is made steam-tight by packing between the nut and the collar.

In case the glass breaks, the steam and water connections are instantly closed, automatically, by ball check valves, one of which is shown in the sectional part of the lower connection. These drop back by gravity against a removable wire retainer, or are forced back by the point of the valve-stem when the valve is closed.

This gauge is manufactured only in New York, and is being introduced on the Pacific coast by D. M. Doub, manufacturers' agent for steam specialties, 137 First street, this city.



RIEDLER AIR COMPRESSOR BUILT FOR THE MILWAUKEE MINING CO.

The Riedler Compressor.

This is one of the recent productions of the Fraser & Chalmers Works, Chicago, and is offered to the trade by that well known house. In reply to an inquiry concerning the machine herewith illustrated, Mr. C. H. Fitch (of Fraser & Chalmers) writes us as follows:

The 18x30-inch double Riedler compressor, driven by 18-inch and 28x30-inch Corliss compound engine for the Milwaukee Mining Co., takes the place of a smaller compressor of another make, and does twice the work on one-fourth less fuel, so that the cost of fuel for similar work is as 1 to 2¾ between new and old plants. In this case, wood being $3.50 a cord, the reduction of fuel bill on the basis of power now used amounts to $9000 a year. This result is due in large measure to the better adjustment of engines to their load—to good steam engineering, but it is also an illustration of the success of the Riedler system.

SINCE the passage of the Caminetti law requiring miners to build restraining dams for their debris, there are already constructed or in process of construction, dams and impounding reservoirs with a storage capacity of 21,336,723 cubic yards. These have all been built by the miners themselves without aid from the Government or State. Though both Government and State are vitally interested, neither has put up a cent towards these works.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The McLewee Improved Automatic Safety Water Gauge; Riedler Air Compressor Built for the Milwaukee Mining Co., 289. Four Spindle Sander; Nine Inch Molder, 293.
EDITORIALS.—Natural Soda in California; Automatic Water Gauge; The Riedler Compressor; Miscellaneous, 289. The Elections and the Miners; Black Sands; The Miners' Convention; The Los Angeles Oil Wells, 290. Gravel Mines and Capital; The Siemens and Halske Cyanide Process; Miners' Convention, 291.
ELECTRICAL PROGRESS.—Electrical Progress in the South; Transmission of Power; The Storage Battery Problem; Electrically Operated Machine Tools, 296.
MECHANICAL PROGRESS.—Leakage of Steam Plants; Hydraulic Forging; Narrow-Gauge Roads Increasing; Cost Per Horse Power, 297.
SCIENTIFIC PROGRESS.—The Merits of Different Types of Ships; Sunlight as a Disinfectant; Foreign Work and Schemes, 300.
PRACTICAL INFORMATION.—Difference Between Brussels and Tapestry; How to Select Rope; Manganese Steel; Superheated Steam; Diamond Saws, 301.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 298-299.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 302.
MISCELLANEOUS.—Cost of Treating Gold Tailings; The Season on the Yukon; In the Borax Marshes; A New Mine Cage, 292. Two Fine Wood-Working Machines; The Atkins Process, 293. Concentrates, 291. Notes on the Gold-Bearing Black Sands of California; Hydraulic Mining from a Valley Standpoint; Harqua Hala Gold Mining Company, 294. Electrical Precipitation from Cyanide Solution, 295.

FOR the two illustrations and much of the matter in the artiele "Measurement by Miner's Inch" in the issue of October 6th, '94, this paper is indebted to the firm of Jas. Leffel & Co., Springfield, Ohio.

MAMMOTH EDITIONS of the MINING AND SCIENTIFIC PRESS will be issued on the 17th and 24th inst. respectively, in connection with the aunual convention of the California Miners' Association. The matter is one of interest to every one connected in any way with the mining iudustry in this State and all over the west half of America.

MR. SUTRO's new baths out at the ocean beach will accommodate 40,000 people a day. As they are to be cleaued daily—the baths and people both—some of the professioual anti-debris agitators now out of a job in the hydraulic mining regions, better look after this outfit and see that the debris resulting from the operation does no "matcrial iujury to the uavigable waters or lands adjacent thereto."

THE fabulous Enoch Davis "lost mine" has been found on the South Fork of Dry Creek, Utah. The cave where Enoch chopped off the "gold" with his pen kuife has been found, but it is only "fool gold," or, in other words, iron pyrites. The fable of Enoch Davis is but one of thosc thousands of untold stories of lost gold mines of immense wealth. It has about it, however, the tiuge of romance which is not attached to all other yarns. Davis, the man referred to, was recently executed for murdering his wife. While under sentence at Salt Lake City, iu hopes of prolonging his life, he agreed to disclose the whereabouts of the mine just rediscovered, but the whereabouts of which had beeu lost. Gossip had it that the minc was a dream of gold. Its original discoverer was Edward Rhodes, a Califoruia miner in the days of Brigham Young. Rhodes was a Mormon and submitted at all times to the mandates of Brigham Youug. He told the Mormon leader of the miue, but was not permitted to work it for fear of bringing thousands of Gentiles into the Territory. Finally he told Davis, who went with him and saw the mine. On the return, Rhodes was killed by Indians. This was Davis' story, uow one of the old miniug legends. The men who found the claim had Davis' maps, and fouud everything all right except the chunks of gold. This ends another "lost minc" yarn.

The Elections and the Miners.

The prospective value of the gold iu the California hills aud mountains is just the same after as it was before the election. The question of the iudividuality or political opinions of the gentleman who occupies the gubernatorial chair has no special effect on mining property. Gold is not impaired or increased in value by the political complexion of Congress in the least. It is worth just so much and no more. Changes of tariff laws have no effect on it, as they do on some mineral products. Other values are based on gold as a standard, and this is our principal product from the mines in this State.

The only incideutal result which may have any effect on certain branches of our gold mining industry is the attitude which the newly-elected Congressmen in the mining districts may take toward it. They can exert a certain influence in Congress in favor of, or opposed to, the miners' interests. Congressmeu from all districts may, of course, do this, but those from the mining regions will naturally have more to say on these subjects.

The first and second congressional districts are most important to the miners. In the first Mr. Barham has apparently displaced Mr. Geary. The uew Congressman has in his district the mining couuties of Plumas, Shasta, Sierra, Siskiyou and Trinity—all important regions. It is understood that the gentleman is favorably inclined to the miners' cause, and will help it as far as possible. The only part of the district affected by debris questions is Plumas county, the drainage of the other mining counties being into the Klamath, a nonnavigable stream. In Siskiyou county there is said to be more miners at work than in any other county of the State.

It is in the secoud district that the most interest is taken in hydraulic mining. Mr. Caminetti, the author of the Caminetti law, has been defeated in this district by Grove L. Johnson, the talented lawyer aud orator of Sacramento. In times past Mr. Johuson has been opposed to the miners, but at the miners' convention of 1892 he was present and made a fine speech urging an amicable adjustment of the difficulties, and expressing his desire to see hydraulic miuing resumed on the basis proposed.

During his canvass Mr. Johnson distinctly favored the miners' cause in all his speeches, and he made the same speeches in the valleys as in the mountains. He has pledged himself to see justicc doue. He has stated that it is to the interest of the valleys to see hydraulic miniug resumed, under present conditions, as giving a market for valley products, and has expressed himself as favorable to Government aid for dams in the rivers.

It will naturally come to Mr. Johnson to handle any measures in the House which may affect the interests of the majority of the principal mining counties of this State. To oppose the mining interests he would have to "go back on" his pledges and specches, and this he would hardly do. The miners have helped him greatly iu his election, believing in the sincerity of his statements. The merchants of his own town want the business from the miniug section, and want hydraulic mining resumed, now that it is found the work can be carried on without injuriug the streams. Mr. Johnson, from his talents as an orator, will doubtless have more influeuce in Congress thau Mr. Caminetti had, and will exercise it on behalf of the miners of California.

Black Sands.

The first of a series of articles on the gold-bearing black sands of California, by Mr. J. A. Edman of Plumas county, will be found elsewhere in this issue of the MINING AND SCIENTIFIC PRESS. Mr. Edman's chief work has been in the deep gravels and their tailings, and the results of his researches are of great iuterest to the mining community. He has now about 300 microscopical slides illustrating the auriferous black sands and their coutents, and these he inteuds bringing to this city shortly, when they may be examined by those who wish to see them. Mr. Edman showed a number of these slides to the editor of the PRESS not long since, and they are really of very great interest.

It is uot only the black sands of the ocean beaches which contain auriferous wealth, but the black sands resulting from the washing of the deep gravels are also richer than is commonly supposed. The contents and values of these sands are described by Mr. Edman, who has been studying them for some years. Few miners pay the attention they should to the black sands which concentrate with the gold in gravel washing, or know much about them. It seems that more or less of value in them is usually lost or wasted. It will pay miuers to read Mr. Edman's article carefully, for, as stated, he has investigated this subject of black sands very thoroughly.

The Miners' Convention.

Now that the election is over, the miners of this State want to get right to work and select their delegates to the State Miners' Convention. There will be nothing savoring of politics in this connection, so all hands can join in and make the coming conveution a success. The Convention will meet at Metropolitan Hall on Fifth street, near Market, on the 19th inst. The headquarters will be at Parlor A, Palace Hotel. Proper arrangements are being made for the reception of the delegates from the interior, and the present indications are that the Convention will be a success in every way.

The miners of this State have gained a very important point in calling to the attention of Congress the fact that legislation was needed for their industry. Now they must show that more legislation is necessary. If they do not do this themselves no one else will. For years they remained without organization, and no attention was paid to individual demands. Once they became organized, however, and formulated their demands for relief, Congress listened to their petitions and granted their requests.

A beginning has thus been made, and with proper efforts, in due time, if the miners all "pull together," they will be enabled to free the mining industry from many of the burdens which oppress it. The laws need changing in many respects, and these desired changes the miners should point out. Congress will surely give due consideration to demands from such au orgauized body as the California Miners' Assoeiation. Other States should join hands with us and assist in every way.

Because we have obtained one special law from Congress, it is no reason we should rest until others which are desirable are passed. The miners have this matter to some extent in their own hands and must work out their own salvation. They must set forth their case as best they may, and it remains for Congress to consider it and afford the relief.

It is hoped to see large delegations from the mining counties, and the officers of the branch organization should at once attend to their part of the work.

The Los Angeles Oil Wells.

The oil discoveries in Los Angeles have already had the effect of bringing crude oil at that poiut from $2 per barrel to a level of 87 cents to $1. Storage reservoirs are being built and three pipe lines projected. Adequate storage facilities have not yet been provided, but the owners of wells to the north of Los Angeles, who have depended on that city for a market, will soon have to make arrangements to ship their products to San Francisco, so we should be benefited here by a cheaper fuel in due time.

The discovery of these new wells is thus important not only to Los Angeles, but to the State at large. With a more abundant and increasing supply, crude oil will be more uuiversally used as a fuel in all branches of manufacture and industry.

It really seems unnecessary to send to far-off Peru for fuel oil in San Francisco, when there is such an abundant supply in our own State. It has not been sufficiently abundant or cheap heretofore, but these new discoveries should settle those questions. The limit of consumption in the southern counties will soon be reached, aud the producers must extend their markets. The cities of the upper part of the State will get the benefit of these conditions.

Prospecting for more oil is beiug vigorously carried on, and doubtless many more producing wells will be opened. The main difficulty now is storage capacity, but that will soon be provided. Other producing sections in the same region are among the possibilities, of course, and thorough investigations are now being made.

Gravel Mines and Capital.

A number of valuable gravel-mining tracts in Baker county, Oregon, which have been worked in a small way for many years, have passed recently into the hands of syndicates, and the Baker City *Democrat* sees in this a new era in gravel mining in that section. Heretofore gravel mines have been worked by home people possessed of limited means; and, while the gold production has been considerable each year, it has been only a small per cent of what the output could have been if the mines had been equipped with the modern improvements for working. The difficulty under which mine-owners have labored in the past has been all the time realized, but there was no way out of the dilemma and there was nothing to do but bide the time when capital would see the value of the placer tracts and take advantage of the opportunity to operate them on a scale commensurate with their value and unlimited extent. The Oregon mines of this class have an advantage over many of those in California, there being no restriction on their output by reason of the vexatious debris question.

Hydraulic mines of any magnitude can seldom be operated by individuals; associated capital is necessary to open and equip them. Storage reservoirs, ditches, pipe lines and other factors for abundant and continuous water supply must be provided before the mine can be operated. In drift mines, long and expensive tunnels must usually be run before the channel can be reached and worked. Therefore in both hydraulic and drift mines an outlay of capital must be made before the mine can make any production, even small.

There are still in this State large tracts of auriferous gravel which have never been touched at all. The first cost of the ground itself is often small compared with what must be expended for suitable equipment. Therefore this class of mines is unsuited to the uses of the ordinary miner, unless he can call in the aid of capital.

The gravel fields of Oregon have never been developed on any such scale as those in this State. The ditch and reservoir system in California, connected with these mines, entailed an expenditure involving an investment of about $100,000,000. The system was gradually built up during a period of some forty years, until it became very extensive. In Oregon, the gravel fields have been worked on a small scale as compared with those of California, nor are they so extensive, but the advent of capital in that department of mining should largely add to the output of gold in our neighboring State.

The Siemens and Halske Cyanide Process.

In another part of the MINING AND SCIENTIFIC PRESS of this week is a very important article bearing on the recovery of gold by the cyanide system. It was supposed by some experts that the part that electricity played in promoting the operation of cyanide as a gold solvent was imaginary. In the light of the experiments tried at the Worcester mine, Witwatersrand, with the Siemens and Halske process on the electrolytical precipitation of gold from cyanide solutions, it seems there is something in it after all. According to the *South African Mining Journal* 3000 tons of tailings were treated at the Worcester works at a cost of three shillings per ton, the extraction being over seventy per cent. Experiments were conducted over a period of four months with this large bulk of material, so it was not a mere "sample" that was treated.

If the conclusions are correct, this Siemens-Halske process is a second great step in advance in the treatment of gold ores by cyanide, the MacArthur-Forrest having been the first. The demonstration that very weak solutions of cyanide can be successfully used in this process effects a great saving in cyanide. When the MacArthur-Forrest process failed in the treatment of complex ores, greater strength of solution was used. The Siemens-Halske people use weaker solutions instead of stronger. They do not use the zinc sponge as a precipitant of the gold, but use electricity.

The description of the plant in use at the Worcester mine, which is given in another column, while not quite complete in detail, shows that the system is not so complex as to baffle a metallurgist of ordinary scientific attainments. It will be noted, also, that the patentees of the new process propose to charge only three per cent royalty, which is much less than the charges which are being made by the old company.

The Miners' Convention.

Under date of the 7th inst., the Executive Committee of the Cal. Miners' Association has issued the following:

Our coming Annual Mining Convention, which meets on the 19th of this month in San Francisco, will be a very important session.

The principal subject to be discussed is the revision of the present United States mining laws as applied to locations of claims and the proving up of mineral titles.

The present rulings of the U. S. Land Department are working great hardships upon the miners and should be changed or modified. Mining in California has once more come to the front and occupies again the position it should in the commercial world. We hope that you will do all in your power to have your county association elect and send delegates to the coming convention, and in case some of your delegates elected cannot come have them send their proxies to some one else who can attend and who will vote for your interests.

THE Newlands mining bill will come up at the next session of Congress and will be backed by the influence of the California Miners' Association. It is by far a better mining bill than that drawn by Senator Stewart, and which he introduces at every session. There are many objectionable features in Senator Stewart's measure and these have been pointed out to him, but he refuses or neglects to make any changes. These objections are eliminated from the Newlands bill, which has been carefully scrutinized by a special committee of the California Miners' Association. It will be to the advantage of all quartz and drift miners to have this new bill passed at the coming session of Congress.

Concentrates.

THE Ontario mill of Utah has commenced shipping base ore again and several teams are now on the road.

THE Golden Rule mine at Cable Cove, Oregon, has shipped fifty tons of ore to the Everett Smelting Works.

A TWO-FOOT QUARTZ LEDGE has been struck in the Mary Jane gravel mine near Washington, Nevada county. Free gold is shown.

JOHN VAN, late foreman of the White Susan mine, has taken the superintendency of the Cabel or La Bellevue mine at Granite, Oregon.

THE Mt. Lewis cyanide works at Junction Creek, Col., are being enlarged, the process being quite successful with the ores of that vicinity.

H. A. SWIFT is expecting a carload of new machinery at Oroville for his mine at Granite Basin. A new mill and hoisting works are being erected.

THE Smuggler mine at Aspen pays a dividend monthly of $50,000. The Gibson and Argentum J. properties will soon be in shape to resume dividends.

THE Mason Valley *Tidings* says: The Wellington quartz mill is running on ore from the Pin-Hook gold mine, located fourteen miles from the mill.

THE Eureka Lake and South Yuba Canal Co.'s mine at Columbia Hill, Nevada county, operating under the Caminetti law, is running a six-inch monitor.

THERE are reports again of a copper combine, but so far the reports have not been traced to any reliable source. Let the report be as it may; the market remains quiet.

R. J. CAMERON, of Uniontown precinct, Oregon, has bonded his real estate to Messrs. McCarthy and Bailey for $25,000. It comprises a large area of rich mining ground.

THE Virtue mine, Baker City, Or., owned by G. W. Grayson of Oakland, and superintended by John McNally, is proving a steady producer and is making some handsome cleanups.

AT Pine Grove, Nev., the Wilson mine is being worked by lessees. They pay a royalty of fifty per cent and the owners furnish tools and all mine supplies, and mill the ore free of charge.

A STEAM PUMP has commenced to "fork" water from the Live Yankee mine, on the Nevada City road—a short distance from the county seat. T. J. Benney has charge of the property.

THE company which has bonded considerable mining ground on Foots creek, Oregon, have struck bedrock, and the prospects for good pay are excellent. They have over 900 feet of tunnel and are still drifting.

THE camp at Cable Cove, Oregon, is expected to give employment to more men this winter than ever before. The recent sale and bonding of a number of mining properties there have made a prosperous camp.

THE extension of the San Pete Valley R. R. to the Morrison coal mines has been completed. It is expected that the next extension will be to Salt Lake City, so as to bring the coal from the mines to a good market.

THE Anaconda *Standard* devotes a page article to statements from business men refuting the assertion often made that Anaconda is controlled entirely by one corporation and that no one can do business there without their consent.

AT the annual meeting of the Alpha Mining Company 85,565 shares were represented and the following officers elected for the ensuing year: Charles Hirschfeld, president; A. K. P. Harmon, vice-president; and J. Thomas Anderson, A. Jackson and C. C. Harvey, directors. Charles E. Elliot was re-elected secretary, and his financial statement showed a credit of $2452.95 on October 1.

JAMES WALKER left Vanderbilt with four men this week. He has built two arrastras at Goldstone, San Bernardino county, which he intends to run with a gasoline engine. He has four feet of ore which will run $60 to the ton in gold.

ONE of the largest diamond drills on the Pacific coast, capable of boring 4000 feet, has been taken to Port Angeles by an Ohio syndicate and work of prospecting for coal will be commenced. The Ohio men agree to bore to a depth of 1000 feet and develop the coal, if found, in consideration for which they will receive $10,000 and the mineral right on 2000 acres of land.

THERE are many dividend-paying mines in Gilpin county, Col., but no report is to be had from them. The same can be said of San Miguel and Lake counties. Colorado has a long list of profit-paying mines, data from which it is impossible to get. Same way with California. They do not publish anything about dividends out in this State.

THE Red Mountain and Guston mines are not shipping the amount of ore that was expected with the completion of the Walsh smelter at Silvertou. It seems that the smelter requires considerable quartz and silicious ores, now unobtainable; therefore the large output that would be possible from the mines mentioned cannot be treated.—Denver Mining Record.

A BRIGHTER outlook in the iron trade lends cheer to the entire business world, because the iron industry is looked upon as the pulse of general prosperity. At Birmingham, the great Southern iron center, the orders are many and, though for small quantities, keep the output cleaned up. The twelve stacks in operation now are outputting as much iron as over twice that number did in Birmingham some years ago.

AT El Dorado Canyon, Lincoln county, Nev., there is considerable activity. Flood & Co. have twelve men at work on the property which they have bonded. The main shaft is down thirty-five feet, showing four feet of gold ore which assays $45 to the ton. J. Lisle is working a claim adjoining the above property, which also shows good ore. The Southwestern Co. have not done any work for the past few months, but it is expected that they will soon start up again.

GRANT'S PASS claims to be the liveliest town in Oregon. The *Courier* of that place says: "The explanation of this state of affairs lies in the constant stream of gold dust leaving our hillsides for the mints to be coined into the only circulating medium the money-lenders will accept. Those communities depending upon the productions of the field, orchard or stock range are feeling the effects of the lack of demand for wheat, dried fruits, hops, wool and live-stock.

THE inconveniences of surveying in the mountains of Arizona was strikingly instanced by Surveyor Drummond, on his recent contract in northern Arizona. The channel of East Clear creek, in Coconino county, is an unbroken canyon from 300 to 800 feet in depth. The survey party wished to cross to the other side at the line they were running, and had to travel 142 miles to get their horses and supplies to the same section, on the opposite side.—Tucson Citizen.

THE Gold Bronze mine at Vanderbilt, San Bernardino county, is improving daily. The main shaft at a depth of 275 feet has thirty-six inches of ore, which will run from $100 to $200 to the ton in gold. Campbell's mill, which has been idle for ten days, on account of the breakage of the main shaft, is now running again. In the Boomerang shaft, at a depth of 535 feet, the ore will average $45 to the ton in gold. The water supply from this shaft is now adequate to run the mill steadily.

AFTER a prolonged session the board of directors of the Bullion-Beck and Champion Mining Company, of Utah, has let the contract for the concentrating plant, to be erected at once, to Messrs. Fraser & Chalmers. While no figures were made public, it is said that the machinery covered in the contract will call for an expenditure in the neighborhood of $30,000. In addition to this contract there are the construction and materials, all of which will swell the total cost of the plant to about $50,000. It is to be of 200 tons capacity.

IN an action to enforce a mechanic's lien on a mining company's entire property, in which several interveners claimed liens against the same, and one claimed a lien against a portion only, a decree was entered fixing the amount due each claimant, and ordering the entire property to be sold to satisfy the liens. All parties assented to the decree and no motion was made to set aside the sale. It was held that the sale was not void, on the ground that by such sale the person claiming a lien against only a portion of the property shared in the proceeds from property of which his complaint did not give the court jurisdiction.—Sawyer vs. Ryan, 62 Federal Reports, 635.—United States Circuit Court, District of Colorado.

THE gold placers in the Four Mile country, Routt county, Colo., are attracting much attention. The Four Mile placers are situated about sixty miles west of Hahn's Peak, in the neighborhood of where the range of mountains and hills between the Yampa and Snake rivers terminates in what is known as the Iron Springs Divide. On both sides of this divide, especially in the gulches running north, are the Four Mile placers, and the country round about doesn't bear the slightest resemblance to placer ground. Its general appearance would indicate a vast sand bank, and in the early days a prospector panning for gold in this ground would have been considered crazy, but the gold is there all the same. Much prospecting and development has been done along Four Mile and Timber Lake gulches. The method of sluicing is by the Burlap system of boxes, and it is asserted ninety per cent of the gold is caught. Water is scarce, however, and after July 1st little can be done except by dry washing machines, several of which are being used.

An Important Decision.

LONDON, Nov. 8.—In the Chancery Division of the High Court of Justice to-day Justice Romer handed down his decision in the MacArthur-Forrest cyanide of gold extraction process patent litigation.

The action was brought by the owners of the patent against alleged infringers, and the defense was that the process was old and the patent invalid. The decision is against the owners of the patent, and may have considerable effect in America, where the process is also patented and in use.

Cost of Treating Gold Tailings.

In a former article, says the London *Mining Journal*, we showed bow the application of cyanide of potassium to the reduction of gold in tbe tailings of stamp batteries has given an opportunity for remunerative working of mines in whicb the ore is low grade and refractory. But while we there dealt simply with the prospects involved in the development of the cyanide process at present in vogue, there are two other items in the future reduction of working expenses at the gold mines, in the cheapening of the chemical itself, and in the introduction of new means of employing it. In the Transvaal the gold mining industry has been menaced, as our readers know, by the threat of a Government monopoly of cyanide, but this proposal, which would have the most disastrous results on the gold mining industry, has been negatived, at all events for the present. It is not surprising to hear that Mr. MacArthur is opposed very strongly to this contemplated monopoly. While it might lead to an increase of royalty from tbe mines already employing the process, it would certainly act as a check upon the development of gold mining in the many districts of the Transvaal, such as Lydenburg, the Murchison Range and the Vryheid gold fields, where it has as yet hardly been tried, and would tend to accentuate the already strong tendency of investors to turn to Australia rather than Soutb Africa for new gold mining ventures. While there is, however, still the shadow of tbis cyanide monopoly over the Randt, there are other influences at work which should largely reduce the coss of cyanide.

Tbe conversion of an obscure photographic material iuto a commodity of wide iudustrial range—for some 150 tons of cyanide of potassium are now used in the Witwatersrandt mines every month—has, of course, resulted in entirely cbanging tbe machinery of production. In the first place, its effect was, of course, to "boom" prices, but since then English and Scoteb chemical manufacturers have recognized an opening, and have gone in largely for the production of tbe chemical. Germany has sent out nearly a tbousand tons of cyauide to tbe Transvaal this year, whereas a couple of years ago tbe exportation of this chemical practically did not exist. As a consequence, there bas lately been a reduction of some twenty-five per cent in the price of cyanide. This tendency is likely to be strengtbened by the increase in the means of production. Several new furnaces are being built, both in this country and on tbe Continent, wbich will add largely to the supply. Even greater economy is promised by tbe improvement iu tbe method of turning out tbe product. Hitherto cyanide of potassium has been manufactured from yellow prussiate of potash, which is obtained from waste boofs and horns. One can understand tbat the supply of tbis latter material is strictly a limited quantity, and it has, as a matter of fact, not been elastic euough for the great increase in the demand for the finished chemical. Within the few years during which the extraction of gold by cyanide has been practiced the price of yellow prussiate of potash has gone up about ninety per cent, tbe present figure being about 10½d. per pound. Now, however, a new process will be introduced, wbich will dispense with this dear raw material. As to the character of tbis process, details have naturally not been made public, but we understand that an extensive plant is to be erected at Oldbury, near Birmingham—the first place in which aluminum was produced at a moderate price—and it is believed that the cyanide produced can be sold very much below the present rate. Tbere is thus some prospect of important results towards further ecouomy in tbe working expenses of gold mining in this respect.

The introduction of electrolysis into the cyanide plant is, however, expected to carry economy much further. Tbe great merit of the electrical method is that it allows the same results to be obtained with a weak solution of cyanide as are possible ordinarily with strong solutions. Many attempts have been made to perfect a practical electrical process, and there seems room to hope that tbey bave uow been crowned with success. Iu actual work the latest form of the electrolytic process has worked at a cost of 3s. per ounce, treating 3000 tons a montb, whereas tbe best results obtained uuder the ordinary process, without the intervention of the electric current, are not even hoped to be better tban 6d. per ounce above this. With 8000 tons of ore per month, the new process is expected to reduce the cost of working to 2s. 6d. Some saviug is obtained by the use of lead and iron instead of zinc in the prevailing system, but the main economy is due to the lessened consumption of cyanide, as we have described it. If we take the average cost of the cyanide process at 4s., it will be seen that a clear reduction of thirty-seven per cent is promised in the item of gold extraction. If the process is found to be workable upon an extensive scale, it must naturally give a perceptible stimulus to gold mining development in the Witwatersrandt. Several mines are unable to make so much headway as could be wished, owing to the heavy cost of extraction, and tbose that are paying large dividends are likewise on the lookout for some new processes that will reduce their expenses. Directly tbe merits of any such system become recognized, there will not be wanting companies to avail themselves of it as a means of making the industry more profitable. It must not be overlooked that the Transvaal may not be destined to monopolize the attention of investors, as it has done during the past few years, and if there is any real foundation for the reported existence of solid masses of gold in western Australia, the Transvaal companies will have to exercise the greatest economy if they are to keep the industry at its present profitable level.

The Season on the Yukon.

From several articles in the Alaska *News* we glean the following items concerning the past season's work on the gold placers of the Yukon river region:

Joe Ladue is one of the best known men in the Yukon country, having a trading post and a sawmill at Ogilvie, at the mouth of Sixty Mile river. He has resided tbere since 1882, coming out to Juneau the first time in 1888, and this being his second trip. Joe leaves on the steamer for San Francisco, en route for his home in Plattsburg, N. Y., and will return here next March to go into his post. As Mr. Ladue is one of the best posted residents of the Yukon country, his opinion of the mining industry will carry weight with the public and should furnish food for thought for those intending to go in. The following reliable information is gleaned from him:

It is a hard country to get in and out of, and the cold winters and short working season require energy and money to properly outfit and prospect. "I believe that the Yukon country will prove a big gold field, but it requires money to open out many of the deep placers. This season most of tbe newcomers were short of money and inexperienced, and of the 600 who came in last spring, nearly half have gone down tbe river and left the country. They could not find work, and had not the money and experience to successfully prospect. Of the new camps Birch creek ranks first. There are fully 300 miners there and two towns, one named Circle City, as it is under the Arctic Circle. The reports go that the diggings exceed in extent and richness those of Miller creek. Birch Creek is 238 miles from Forty Mile, and has three rich gulches. Those formerly of Juneau who are doing well on claims there are Billy McMoran, Jim White, Tom Edmonds, Charley Brown, Jack Gregor, Pat Keneller, Missouri Bill, J. Stewart. Miner creek, a new find 150 miles above New Klakayhet, a trading post at the month of the Tananah, also shows up very promising.

Dawson, formerly a carpenter here, has bought the raft and horses from Jack Dalton, and will take supplies to Birch creek. There are more claims on Birch creek than on any other, many leaving Forty Mile and vicinity to go there and take up claims, and it now looks as if Birch creek will have more residents than Forty Mile this winter.

There are five or six claims on Miller creek that have panned out big this season. The others have not been opened out yet on account of the deep surface dirt. Among those taking out pay were Frank Cromeau, leading the list by taking out this season $28,000 and selling his half interest in the claim for $5000, making $33,000 all told. He left for his home. Wm. Legget and Peter Wyborg each took $15,000 out of tbeir claim, the former selling out his interest to purchase a claim at Birch creek. He will spend the winter in tbe States.

On Saturday tbe schooner Gertrude arrived from the Chilkat portage with six miners returning from a season's trip into the upper Yukon river country. They were Audrew Slater, Chas. Larsen, O Steveuson, Matt Liusem, Tom Bismo and Mr. Anderson. In an interview with Mr. Stevenson he makes the following statement of their explorations:

"We started from Juneau April 1st. Our first prospecting was on the Hootalinqua, ascending the stream for six miles, but the prospects did uot look encouraging, and we went down to Stewart river and ascended that stream about 200 miles. Returning down 100 miles, we started up McQuestin river, which is a tributary of the Stewart We ascended the river sixty miles, and found it a very swift stream and full of riffles. Leaving this section, we went back up the Hootalinqua and up that stream for 180 miles, where we stopped and mined awbile and then came out. The highest pay we struck on Hootalinqua was $6 per day on scattering bars.

We mined on Stewart river awhile, but with poor success, as the available bars on Stewart are mostly worked out, and high water preveuted us from working the low bars. A party of miners came up from Forty Mile in Jauuary aud took up the richest bars on Stewart. We did some mining on McQuestin river and sunk a shaft, but struck no pay. Returning on a raft they upset aud lost their tools and provisions; and, upsetting a second time, one of the party, an old German who has been on the Yukon for eight or nine years, was drowned. The party came up to our bar on Stewart.

Game seemed to be plentiful in that section, our party killing tbree moose and seeing plenty of bear.

In the Borax Marshes.

The following is an extract from a letter written by Mr. Henry Rhine to the Inyo *Independent*, from the Borax Marsh:

"The Chinamen are all very industrious, rising at half past four, breakfasting at five and going to work immediately thereafter. They retire at about seven P. M., but do not attempt to sleep till about eight, the time being occupied in one continuous jabber. Mr. Chas. Ling, president, showed me over the marsh, or rather a part thereof, this morning, pointing out to me the soda, cotton ball aud crude borax. Of the last named there is a field of about ten acres, which Mr. Ling says is of a very fine quality. At present the company is making borax from the cotton ball. Seven loads of soda and seven loads of cotton ball are cooked together for about eight hours. At five A. M. fire is started under the boiler. This fire is kept up till about nine A. M., or until the water is brought to the boiling point. The soda is then dumped into the boiler and stirred continually by five men with long-handled shovels. After the soda is all dissolved, the mud at the bottom of the boiler is shoveled out. Let me state here that I speak of soda and cotton ball as the terms are used industrially. The soda is some compound of soda and the cotton ball some compound of borax. By the process employed the soda combines with the foreign matter in the cotton ball and liberates borax, which is held in solution in the water. After the mud, which is necessarily thrown in with the soda, is removed, the cotton ball is dumbed into the boiler and the stirring process is renewed. After having been sufficiently stirred, the mud which comes with the cotton ball is shoveled out, and at about three o'clock the boiler is covered over with boards, and the water holding the borax in solution is allowed to settle. The next morning at two o'clock one of the Chinamen gets up and draws the water off, by means of a hose fastened to an opening in the boiler, into large galvanized iron tanks. The mud remaining is drawn off by means of another hole in the opposite side of the boiler. This last mud so drawn off is run off into a large vat or hole in the ground and is afterwards boiled again, yielding a very fine quality of borax. The tanks or crystallizers are about five feet high with a diameter of about five feet at the bottom and four feet at the top. Suspended from iron pipes across the top of the tanks are the hangers. These consist of strips of galvanized iron about fifteen inches wide and about four feet long, twelve to each tank. On these hangers the borax crystallizes, the process requiring about eight days. Each boiling is sufficient to fill two of these tanks, and the yield of borax is about eight to ten sacks. The process of crystallization is more rapid in cold weather than in warm, there being a difference of about two days in the time required in summer and that required in winter. The water remaining in the tanks after crystallization is complete is also run into vats and the sediment remaining after the water has evaporated is given another boiling. The mud shoveled out by the men during the boiling process is not made further use of, but is wheeled off in barrows. The borax crystals are scraped off the hangers and spread on a wooden platform to dry aud afterward to sack. The soda aud cotton ball are hauled to the boiler a distance of about a mile, and it keeps two teams going all day to haul the seven loads each of material and the sagebrush necessary for fuel."

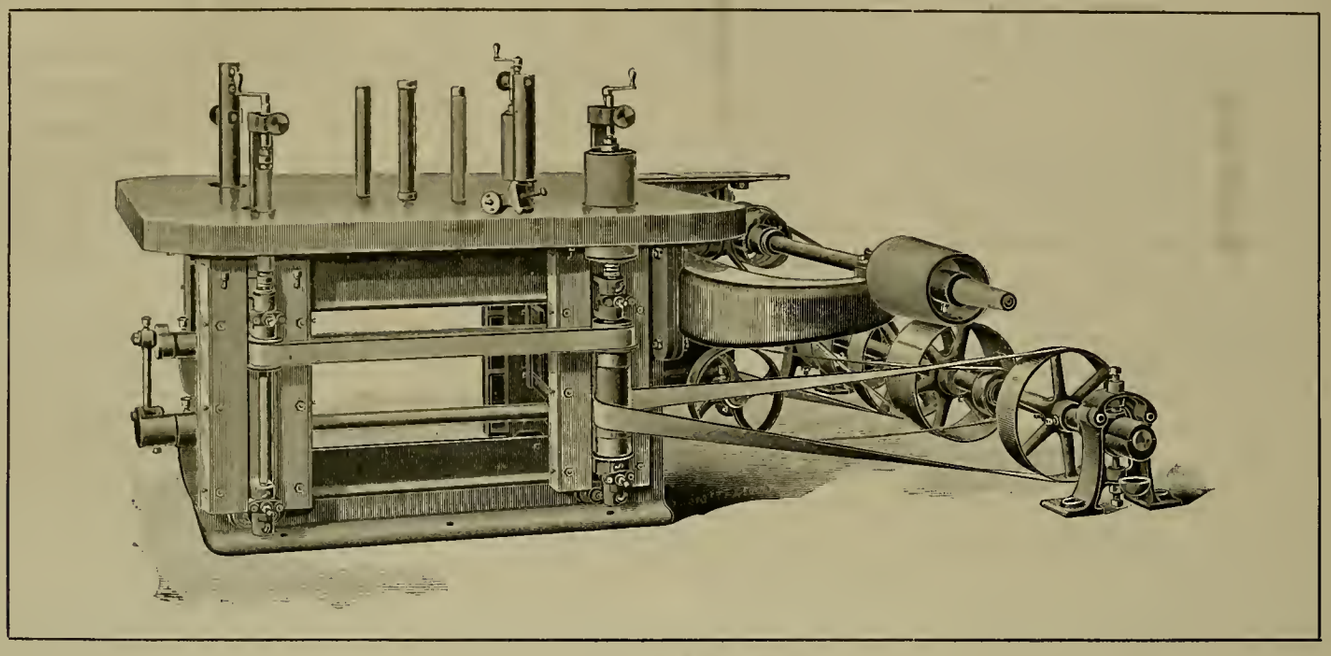
A New Mine Cage.

Alex. Gray, a young mechanic formerly in the employ of the Anaconda company, is the inventor of a patent mine cage, which is now in operation at the Leiter mine at Sheridan. This cage embodies some important features which have hitherto been neglected by mechanics and mining men who have taken an interest in the safety of men underground. The principal feature of the cage, perhaps, is the method adopted to do away with the accidents to life and limb and destruction to property in mines using the old-style chairs. In this cage the chairs are made a portion of the cage, and by a slight pressure of a lever they can be thrown in or out at will. In this cage the station tender can never leave the chairs in, as they fly back as soon as the engine takes the load off of them. They can be used and are very useful in making repairs to the shaft, such as retimbering, etc., as they will rest on any set of timbers, and the men employed in the shaft feel much safer with the cage resting on the chairs than if it was hanging by the rope or cable. Allowing the cage to drop on the chairs at a station is a frequent source of trouble at all the mines of the district as the chairs are now arranged. With this cage the only way damage can be done is by dropping the cage into the sump or by hoisting it into the sheaves. With the old-style cage, the old bottom can be taken off and another bottom with the chairs substituted in about three hours. At the Leiter mine the cage was in running order two and one-half hours from the time work began on the change, and it is claimed that it costs less to substitute the new bottom and chairs than it does to put in an ordinary set of chairs.—Butte Inter-Mountain.

Two Fine Wood-Working Machines.

The illustrations on this page are from the shops of P. Pryibil of New York, manufacturer of wood-working machinery.

The molder is a very heavy machine and is provided with a substantial, removable, outside bearing to the upper cutter-head shaft. It will work moldings on four sides, from ½ to 9 inches wide, and will do any work that can be done on a molding machine.



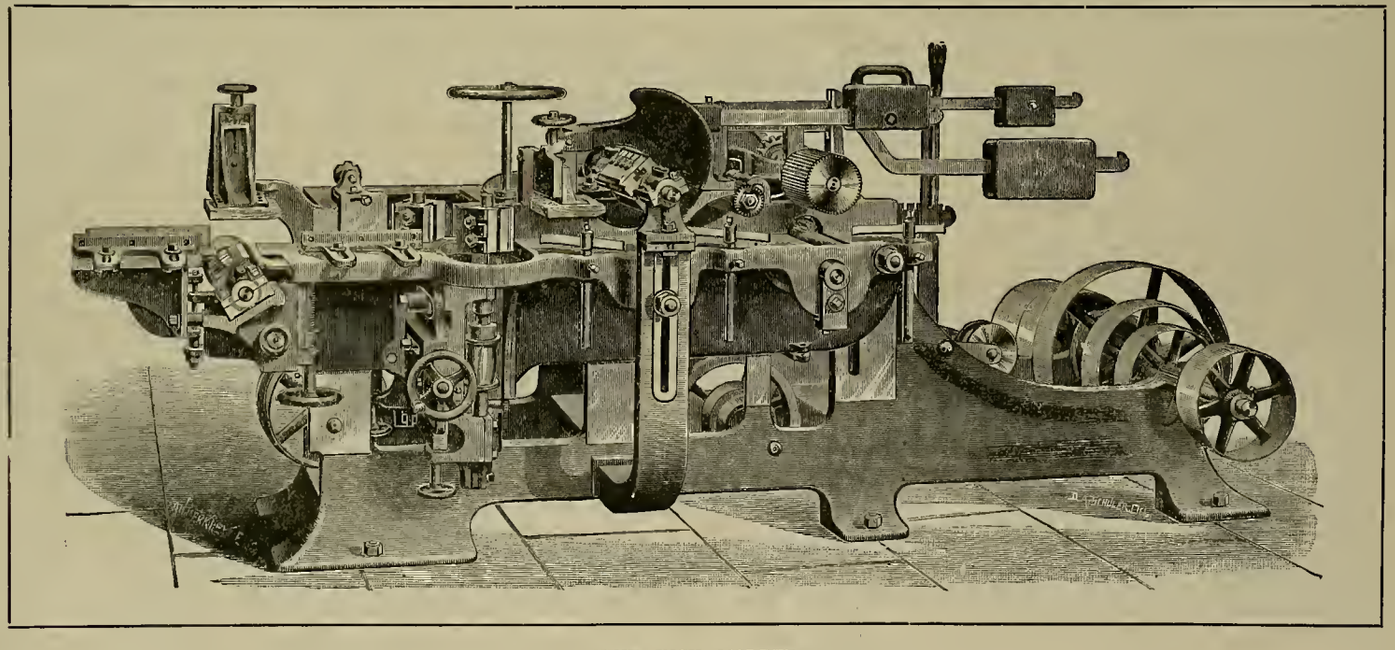
FOUR SPINDLE SANDER.

The side spindles are adjustable vertically and laterally, and the outer one can be inclined to any angle desired, and moved to and from the work without disturbing the angle. The upper cutter-head can be adjusted laterally, and the lower one both laterally and vertically. The feed works are very strong, consisting of three rollers—two above and one below the bed—all connected by a train of powerful expansion gearing, which will allow the bed to drop to take in eight inches. By disconnecting the gearing and working the upper rolls, ten inches thick can be planed. The arbors and cutter-heads are of forged steel, and the latter have four slots. The machine has adjustable chip-breakers, pressure bars, springs and guide, and everything necessary for quick adjustment. The tight and loose pulleys are 14 inches diameter, 7-inch face, and should make about 900 turns per minute. Weight, with counter-shaft, about 3850 pounds.

The sander is intended to do all kinds of sanding. It is provided with the following combination, all parts of which can be operated at once and used simultaneously if desired, thus giving room for several operators to work together.

1. A horizontal drum, with an adjustable table, for flat work.
2. Three free drums with diameters of 1½, 3 and 5½ inches.
3. Four upright drums of ½ to 6 inches diameter.

The upright drums are all in operation at once, at different speeds suited to their diameter, and they thus provide for sanding to the best advantage, curves of different sizes on the one piece of work and with one handling. The upright drums move slowly up and down while revolving, to prevent the formation of streaks in the work. The counter-shaft has twelve-inch self-oiling tight and loose pulleys for a six-inch belt, and should make about 328 turns per minute. Weight, about 4400 pounds.



NINE INCH MOLDER.

The Atkins Process.

The Atkins process is a method discovered about a year ago for the treatment of gold and silver ores by electrolysis and amalgamation. A plant is now in operation at Ipswich, England, where commercial tests have been made showing it to be practical and recovering over ninty-five per cent of the assay value.

The plant comprises one 18-horse power engine, five-stamp battery, four-horse power dynamo, electrical amalgamator, pan and settler. The only chemical necessary is a solution of common salt of one-half per cent strength, which is fed into the battery with the ore. The electric current decomposes the salt, liberating chlorine at the positive pole and forming a sodium amalgam with the quicksilver at the negative pole. In this way gold is in a finely divided condition and is chloridized and afterwards deposited in the quicksilver.

The sulphides and chlorides of silver are decomposed by the sodium and hydrogen formed at the negative pole. The silver is thus liberated in contact with the quicksilver and amalgamated. The process is capable of treating auriferous pyrites and sulphureted silver ores without previous roasting. Eminent metallurgists who have examined the method speak very highly of it and do not hesitate in recommending it.

Those who have visited the plant while in operation say it is very simple, being merely a five-stamp battery from which a spout carries the pulverized ore and salt solution into a vertical steel cylinder, inside of which is a revolving carbon shaft and a quantity of quicksilver. The pulp passes from this to a revolving horizontal cylinder and thence to the pan and settler. Nearly all the mineral that ha escaped from the cylinders is recovered it th settler.

The main cost of treatment is that of crushing the ore, the quicksilver being used over and over again with but a fraction of the loss accuring in ordinary plate or table amalgamation.

The Deadwood *Times* says a quantity of Black Hills ore has been shipped to England for treatment by this process, and if the result is successful it will be adopted in some new works to be constructed in that section.

Notes on the Gold-Bearing Black Sands of California.

NUMBER I.

Written for the MINING AND SCIENTIFIC PRESS by J. A. Edman.

TO THE EDITOR:—The recent article by Mr. Almarin B. Paul, in your issue of October 13th, as well as your extracts from Mr. Keeler's paper in the San Francisco *Bulletin*, came very timely to remind Californians of the as yet very much neglected opportunities to be found in a systematic working of the beach sands, as well as the heavy sands from the deep gravels, generally present in varying proportions in the tailings from placer mines, including hydraulic and drift mines. My own experience during some years of close investigation of the waste products of placer mining, generally confirms the conclusions of Mr. Paul, and having lately been enriched by a study of the beach sands, may serve to supplement Mr. Keeler's observations, and throw light upon the difficult problem of successful beach mining.

For convenience of description the black sands of the coast and estuaries will be referred to as *beach sands*, while the heavy sands of the placer and gravel mines will be treated of as *stream sands*. They vary much in color, from a deep black to a gray or greenish gray, but are popularly referred to as *black sands*.

Ever since the great excitement attending the discovery of gold at Gold Bluff, Humboldt county, in the spring of 1851, beach mining has been prosecuted at that locality and at various points of California's coast from the Oregon line to Lower California, but only at the first mentioned place on a large scale and with economic success. Desultory work has been done in San Francisco bay; at and near the Cliff House; at Santa Cruz; on the coast line between Point Sal and Point Conception; and at Tia Juana, south of San Diego. At present the beach mining industry is nearly at a standstill and is chiefly prosecuted at Gold Bluffs and Big Lagoon.

The beach mines of Oregon were formerly very prolific, particularly at Ophir beach near Rogue river, and at the town of Randolph, but have since declined, and are now seldom heard from.*

Broadly speaking, the origin of California's beach deposits may be traced to the two great drainage systems of the Klamath and Sacramento rivers, the former furnishing the beaches from Oregon to San Francisco bay, while the latter has brought to the coast the material for the deposits as far south as Santa Cruz, and the gold-bearing rocks of the coast ranges have enriched the unimportant beaches farther south. The immense gravel banks fronting the ocean near Gold Bluff are readily traced to the benches along the Klamath river, which extend nearly unbroken for a hundred miles from the coast, and of late years have become the scene of active and profitable hydraulic mining. This enormous mass of gold-bearing material has for ages been undermined by the ocean and subjected to Nature's concentration on a grand scale, and by ocean currents carried south, leaving a portion of the gold with other heavy minerals accessible to the miner on the surface of the beaches. In contrast to this feature, the material eroded by the Sacramento river and its branches has been deposited in the great basin of the Sacramento valley, and comparatively little of its gold has found its way to the sea. On both sides of the Straits of Carquinez the remnants of auriferous bars and beaches are yet found, and one of the most interesting samples of rich beach sand was taken years ago, before the building of the railroad from Martinez, at the foot of the bluff about half a mile from that town. Within the last decade the sands from a bar below Benicia have been worked for gold with moderate returns. The color of gold can be found by careful panning at many points on the shores of San Pablo and San Francisco bays.

The physical characteristics of the beach sands will, as with gold ores in general, determine the true methods of treatment, for which purpose a detailed description will be given of the Gold Bluff sands as typical in most respects of the beaches of our northern coast, and as determined by analysis, assays and microscopical inspection. The naturally or artificially concentrated sands are nearly black and of a specific gravity approaching 5.00, and consist of grains of an average size of 1-70 inch, mainly of the following minerals:

	Specific Gravity.	Hardness.
Magnetite (pure)	5.20	5.5–6.5
Titaniferous Magnetite	4.80–5.00	5 –6
Ilmenite	4.75	5 –6
Chromite	4.46	5.5
Hematite	5.30	5.5–6.5
Zircon	4.45	7.5

The first five minerals form the bulk of the sands and are black or nearly so. They may be classed as: Magnetic—Magnetite and titaniferous magnetite; Magnetic in part—Ilmenite and chromite; Non-magnetic—Hematite and zircon.

The zircons are here generally transparent and colorless, but also pink, red and yellow, and contain many inclusions.

Associated with the above are garnet, spinel titanite, olivine, epidot, and, rarely, cassiterite or tinstone.

Of metallic minerals are found gold, platiuum aud iridosmium, the last two metals being less in weight than two per cent of the gold. The gold is in thin scales, often bent and douhled up, with the edges generally slightly turned over. The surfaces of the scales are much pitted and sometimes quite crystalline, as when acted upon by acid. Nearly ten per cent of the scales have a semi-transpareut coating of brown or black oxides of iron and manganese. In size the gold measures from 1-250 to 1-80 inch, averaging 1-120 inch; a few scales were found up to 1-25 inch. In thickness the scales run from 1-10000 to 1-2500 inch, averaging 1-5000 inch.

The platinum corresponds in size and shape with the gold. The iridosmium is almost lead-gray, in thin crystalline flakes.

Somewhat more than fifty per cent of the saud is worn to smooth and rounded grains, while much of the iron minerals are in angular and slightly worn fragments. A large part of the zircons shows but little abrasion and presents sharp edges and corners. Most of the silicates are in rounded grains.

In gold contents the above sands vary from twenty to one hundred and fifteen dollars per ton of material of specific gravity 5.00. The methods generally in use on California beaches have failed to give a reasonable percentage of extraction, and no economically practicahle system has yet been devised. Simple inspection of the gold should convince the beach miner that amalgamation on plates, in a free running stream of water, will under the best conditions save only the larger particles. Blankets, or other rough surfaces, will largely increase the yield, but fire up with the heavy sand. Magnetic separation will undoubtedly be required as a step in the treatment, which of necessity will be somewhat complicated, but not necessarily expensive. Ou an average, from 60 to 70 per cent of the Gold Bluff sand can he separated by the magnet, leaving the valuable metals in the non-magnetic sands of ilmenite, chromite, hematite and zircons. Such magnetic separation should be on the dry sands, as iu the water they form a compact mass from which the gold cannot be settled, even by strong percussion. These sauds and the gold in them have a strong tendency to float on the water, after being momentarily exposed to the air—a fact which increases the loss iu treatmeut.

From the non-magnetic sand the gold could bc recovered by grinding and amalgamatiou, and a still better result would follow from barrel chlorination. Cyanide treatment would under most couditions be successful, but this gold, although so attenuated, requires a longer time for solution than gold ores in general.

As wave action cannot he depended upou for continuous work in concentration, a scheme for artificial concentration of the poor beach sands must be devised before this industry cau hope for permanency. This should not be difficult, as percussiou tables or belt concentrators properly handled would effect the object. Among belt machines, the Johnston coucentrator seems well fitted for the purpose, if care is taken to feed evenly and slowly.

The above suggestions are made, not as parts of a perfect scheme, but as aids to the investigator, although based upon many tests ou a small scale.

The beach sands of Santa Cruz prescnt almost identical features with those above described, except being smoother and of finer grain, with perhaps a greater percentage of light-colored minerals. The gold contents are insignificant. The smoothest, most rounded and lustrous sands occur near Martiuez, as above noted, where the gold particles are thicker and exceedingly high-colored, clean and bright. This sand forms beautiful mounts for the microscope.

Of late years the original auriferous deposits in the Straits of Carquinez and San Pablo bay have become covered by recent medium heavy sands brought down by the Sacramento river, consisting of the lighter varieties of magnetite and fluorite, with much hornblende and mica, with only an occasional color of gold.

The hopes entertained by Mr. Keeler and mauy others of obtaining a valuable by-product in the working of black sands, from utilizing the iron sand as an ore, will scarcely be realized on the coast of California and Oregon.

While large deposits of pure non-auriferous magnetite sands exist in various countries, as for instance on the coast of Labrador and in Australia, and are excellently fitted for the production of a superior iron, and although local deposits of finely divided or granular magnetite are found in the interior of California, and have been distributed into most of the ancient and recent gravel deposits during ages of erosion, the bulk of the iron sauds both of California's beaches and deep gravel channels consist of the various kinds of titaniferous iron and magnetic chromites, which are entirely unfit for smelting, being almost infusible, as most iron smelters have fouud by experieuce fully tweuty years ago. Using magnetic separation on the beach sands, less than thirty per cent ou an average will be pure magnetic iron, while the balance of titaniferous irou and chromite will vitiate the usefulness of the magnetite. Great and easily accessible ledges of compact titaniferous iron ores exist in the State of New York as well as in Canada, but are shunned by American ironmasters, while magnetite separation on granular or impure hematites and magnetites has become firmly established in the Eastern States.

Meadow Valley, Plumas Co., Cal.

*For detailed information on beach mining localities the reader is referred to the 9th Annual Report of State Mineralogist, page 35; 10th Report, page 545; 11th Report, pages 227-232. Valuable data on beach mining in Oregon are found in Lock's Practical Gold Mining, pages 215-222.

Hydraulic Mining from a Valley Standpoint.

For more than twenty years the mines conducted by the hydraulic process in the Second Congressional district of this State have been a source of trouble and litigation. Two years ago an act was passed by Congress providing that the question should he placed in the hands of a Commission composed of engineers of the United States Army, with authority to place such mining under their control. Competeut engineers were appointed and the gentlemen have since that time been actively engaged in the performance of the duties imposed by the law.

The fact stares us in the face and we may as well admit it, that the sentiment in favor of permitting hydraulic mining to be resumed is growing, not only in California, but in the States on the Atlantic side. In our candid judgment the condition of this question is iu better shape than we can get it again if we reopen the litigation and amend the law in any of its priucipal points. I am aware that there are men of influence on both sides who would be pleased to see the United States Commission knocked out and the old state of things brought back so they may thrive. Of course there are but few of them and they can be placed in one list, to be termed the hog in the hydraulic controversy.

The Sacramento *Record-Union* in a recent editorial apparently takes issue with the law and the United States Commissioners, declaring that the system of dams thus constructed will simply amount to a waste of money; and to prove that it has argument on its side refers to the Parks dam of years ago, which, in fact, was a mere brush fence laid in the sand with the tops pointing up stream. The *Record-Union* is not the first journal to take issue with the Government engiueers and to undertake to teach them a lesson in the art of constructing restraining dams, as the Sutter *Independent* has harped on it many times. But the strange part of the business with these wise jouruals is that the only remedy suggested is to cease workiug mines by the hydraulic process, which would, if undertaken, reopen the litigation and cause the expenditure of hundreds of thousands of dollars. And when we consider the advance made by the Commissioners in so short a time, it seems strange indeed that there is one journal in the State that should refuse support uutil a fair trial is had, which the law certainly has not.—Marysville Democrat.

Harqua Hala Gold Mining Company.

The directors have issued their first annual report and accounts for the period from June 12, 1893, to June 30, 1894. The revenue account shows a credit balance of £31,682 13s. 2d. as the result of active milling operations during a little more than eight months' working. From this sum two dividends have been paid of 9d. and 6d. per share respectively, and since the closing of the accounts a further dividend of 9d. per share, making a tota distribution for the year of £29,000, or 2s. per share, being at the rate of ten per cent per annum on the capital. All initial legal expenses, together with Captain Plummer's fee for inspecting and reporting upon the property, have been defrayed out of reveuue. The commission due to the American Company under the working agreement has been provided for, and the board have set aside £1000 for depreciation and renewal of plant and machinery, leaving a balance of £776 13s. 6d. to be carried to the next account. The expenditure upon capital account has been £7922, and the balance of capital unexpended, including the amount retained under agreement with the American Company, is £13,436. The cost of the new shaft, £1533 19s. 9d., has been charged to capital account. It became necessary, owing to the dangerous condition of the old shaft, to suspend milling operations for three mouths, pendiug the completion of the new shaft. This stoppage, and the accident to the hoiler in July, account for the period of nearly four months during which no milling was done. Development work has been continuously aud vigorously prosecuted, but with results, as regards the Bonanza group, so far disappointing, the size and value of the veins apparently diminishiug with the depth reached, aud the drifts into the adjoining ground showing little or no value. At the Golden Eagle group developments have resulted more satisfactorily. Mr. Allen, the manager, estimates the reserves of ore at 30,000 tons, but explains that the irregularities of the vein system

make it difficult to arrive at conclusions in the matter with accuraey, and the figure named is, therefore, probably a moderate one. The question of the treatment of tailings has engaged attention, and the board await the results of experiments made with the Kendall process before deciding upon the steps to be taken.—London Mining Journal.

Electrical Precipitation From Cyanide Solution.

The Siemens-Halske Gold Recovery Process.

At a meeting of the Chemical and Metallurgical Society of South Africa, recently held, Mr. A. Von Gernet read the following paper upon the Siemens and Halske gold reeovery process, which has been tried on a large scale at the Worcester mine for four months, after long and exhaustive preliminary experiments at the works of the Rand Central Ore Reduction Company. Mr. Von Gernet said:—

Although the electrical preeipitation of gold, extracted from ores by cyanide, has only been recently introduced into South Africa, it has been in use in Europe and Asia as far back as 1888. The author having been connected with the process from the beginning, he is thereby enabled to give some information concerning its development, based on actual working data, which may be of general interest. In 1887 Dr. Siemens found that the gold anodes used in electroplating at his works in Berlin lost weight when standing idle in the cyanide liquor without any electric current passing through the bath. This fact, baeked by the statements of chemical authorities that gold is soluble in cyanide, first induced him to try the use of cyanide solution to extract gold from ores. In the same year he built a small plant to make experiments on concentrates produced at Siebenburgen. The gold was precipitated from the solution both by electrolysis and with zinc filings. It was found, however, that the zinc method gave good results with strong solutions ouly, while the electric precipitation was equally effective with either strong or weak solutions, and its efficiency was not lessened by the presenee of caustic soda. Dr. Siemens therefore decided to use electrolysis only. Early in the year 1888 he commenced operations on a larger scale, and engineers were sent out to several different countries. Two went to Hungary, another to America, and the author to Siberia. The results obtained were generally satisfactory, although, as might be expected, they varied considerably, owing to the different conditions existing in the respective places. Nothing was done in this country at that time as the patent question was not then settled Except to mention the fact that Mr. Siemens was the applicant for and holder of the first patent in the Transvaal for the extraction of gold by means of cyanide, it is not necessary to discuss this matter, as such questions are beyond the scope of a technical paper, It would be superfluous to explain the elementary principles of electrolysis to the members of this Society, but it is necessary to point out some of the reasons why such a large number of electrolytic processes have not succeeded commercially, the outout from them having been larger in profanity than in gold. As you are aware, the electric current decomposes a solution of a metallic salt, the metal being deposited on the negative pole, while the metalloid is liberated at the positive pole of the electrolytic cell. In a fixed time a given electric current will deposit a certain quantity of metal, which quantity varies for different metals in direct proportion to their electro-chemical equivalents.

This law holds good only for solutions strong in metal, but with very dilute solutious, as in use in the cyanide process, the current does not find sufficient of the metallic compound present at the electrodes, and consequently decomposition of water also takes place. For this reason, to make the efficiency of the precipitation as great as possible, constant diffusion of the solution is requisite. In order, therefore, to create an artificial diffusion, a mechanical movement of the solution is important, and the most economical and convenient way of effecting this is to allow a slow but steady flow through the precipitation boxes. But it is still most important to give a very large surface to the electrodes. In fact a better effect is obtained by doubling the number of plates than by increasing the current tenfold. For this reason it will be seen that mercury cathodes cannot be used with good results. In order to precipitate 100 tons of cyanide solution containing five dwt. of gold per ton, in twenty-four hours, about 10,000 square feet of surface is required. If the bottom of the precipation boxes were covered with mercury, it would be necessary to have it at least a quarter of an inch deep, to make up for difference of level, and thus ensure that the whole surface should be covered. This requires over 200 cubic feet of mercury, weighing eighty tons. Not only the initial expense, but also the trouble in cleaning up makes the use of mercury in this way as an electrode impracticable. The vertical position in which metallic plates can be placed has the great advantage of keeping the surface of the cathodes clean, as any solid matter entering the boxes in suspension sinks to the bottom of the latter, no obstruction being offered to its downward course. Sheets of solid metal (as copper) coated with mercury have also been tried, but have been unsuccessful, because the mercury, owing to the action of the current, will penetrate the copper and form a dry amalgam, which does not adhere to the plate. To obtain a satisfactory cathode a metal must be used which will fulfill the following condition:—

1. The precipitated gold must adhere to it.
2. It must be capable of beiug rolled out into very thiu sheets to avoid uunecessary expense.
3. It must be easy to recover the gold from it.
4. It must not be more electropositive than the anode, in order to prevent return currents beiug generated when the depositing current is stopped.

The most suitable metal for the purpose is lead, which is therefore used in the Siemens' process, and which meets all the requirements of the case. Not less important is the question of anodes. By the action of the current a metalloid is liberated at the positive eleetrode, aud the latter, when a metal, begins to oxidize. Carbon could be used as an anode, but it will not withstand the action of the current, and soon crumbles into a powder, which decomposes cyanide. This finely divided carbon is in suspension, and cannot be removed from the solution by filtration. Zinc used as an anode forms a white precipitate of ferro-cyanide of zinc by the reaction of zinc oxide upon ferro-cyanide formed during the leaching. Similarly iron anodes form Prussian blue by the reaction of oxide of iron and ferro-cyanide. In consequence of this reaction the amount of ferro-cyanide in the cyanide solution does not increase. From the Prussian blue the cyauide can bc recovered by dissolving it in eaustic soda, then evaporating the solution, and fiually smelting with potassium carbonate.

This last process has been carried out only on a small scale, about fifty pounds at a time, but a nice clean cyanide potassium was obtained. In the treatment of tailings this regeneration of cyanide is not of great importance, but with concentrates, which decompose the solution with formation of ferro-cyanide, it will effect a eonsiderable economy. In order to precipitate the gold from cyanide solutions only a very weak current is required; that is to say, a density of about 0.6 ampere per square foot. With eathodes about one aud one-half inch apart, four volts are sufficient to produce this current strength. The advantages gained by using a weak current are:

1. The gold is deposited hard on the plates.
2. The iron anodes are preserved for a long time, as their waste is iu proportion to their current strength. In a plaut treating 3000 tons per month, 1080 pounds of iron are destroyed in that period.
3. Little power is required; 746 Watts equal one horse power. A 3000-ton plant requires 2400 Watts, equal, theoretically, to three and one-half horse power, and actually requiring about five indicated horse power.

The most important feature of electrical precipitation is that it operates on the solution quite independently of the amount of cyanide or caustic soda that it contains. Precipitation by means of a chemical reaction is invariably more complete with a solution strong in cyanide than with a weak one; but with electricity it is absolutely of no importance whatever. Therefore, in the treatment of tailings very dilute solutious can be used, the only limit being a certain amount of cyanide to dissolve the gold satisfactorily. Moreover, however acid the solution may be, when entering the boxes the precipitatiou takes place equally well, the same amount of gold being recovered as from a neutral or alkaline solution. There are none of the complications arising from the formation of lime aud alumina and hydrate of irou, which, under similar circumstances, sometimes occasion so much trouble in the zinc process. Every one here present is aware that a solution containing .03 of cyanide will dissolve gold just as effectively as a solution containing .3 per cent, provided a longer time is allowed for treatment. In the first case the decomposition of cyanide in the tailings is much less than in the second, and a corresponding econony is effected. The moisture in the original tailings being usually about the same as that contained in the residues, there is, as a rule, no chance to give a large water wash after the cyanide treatment is finished. The residue discharged contains ten to fifteen per cent moisture, carrying about .1 to .05 per cent cyanide solution when the zinc process is employed. This is equivalent to one-quarter pound of cyanide per ton of tailings. This loss may be reduced to ouefortieth pound by using as weak wash a solution containing .01 per cent cyanide, which strength will be perfectly suitable for electrical precipitation, though difficult to deal with by the chemical method.

Having described the principles involved in this process, it only remains to give some details as to the practical working results obtained at the Worcester works. There are now in use five leaching vats of two feet in diameter with ten-foot staves, each holding 2700 cubic feet. One tank is discharged and filled every day. The strong solution used contains from .05 to .08 per cent cyanide and the weak washes .01 per cent. The actual extraction of fine gold has averaged 70 per ccnt, while the consumption of cyanide has beeu one-fourth pound per tou of tailings treated. The precipitation plant consists of four boxes 20x8x4 feet. Copper wires are fixed along the top of the sides of the boxes, and convey the current from the dynamo to the electrodes. The anodes are iron plates seven feet long, three feet wide and one-eighth inch thick. They stand on wooden strips placed on the bottom of the box, and are kept in vertical position by wooden strips fixed to its sides. In order to effect circulation in solutions passing through the box, some of the iron sheets rest right down on the bottom, while others are raised about one ineh above the level of the solution, thus forming a series of compartments, similar to those of a zinc box, the difference being that the solution passes alternately up and down through successive compartments. The sheets are covered with canvas to prevent short circuit. The lead sheets are stretched between two iron wires, fixed in a light wooden frame, which is then suspended between the iron plates. The boxes are kept locked, being opened ouce a month for the purpose of the "clean-up," which is carried out in the following mauner:

The frames carrying the lead cathodes are taken out one at a tiuc. The lead is removed and replaced by a fresh sheet, and the frame returued to the box, the whole operation taking but a few minutes for each frame. By this means the ordinary working is not interrupted at all, and the cleaning out of the boxes, which is necessary in the zinc process, is only required at very long intervals. The lead, which contains from two to twelve per cent of gold, is then melted into bars and cupelled. The consumption of lead is 750 pounds per month, equal to 1½d per ton of tailings. The working expeuses, including filling and discharging tanks, come to 3s per ton. When working on a larger scale, the expenses will, of course, be reduced. After the facts mentioned in this paper, it will no doubt be conceded that electrical precipitation has emerged from its experimental infancy and growu up into a healthy manhood, and proved itself to be a techuical aud commercial success, and that it is in every respect at least as good a method of precipitation as the zinc process. Auyway, it exists as a tangible fact, which canuot be explained away by argument or ignored by commercial meu who require the best at the cheapest rate. It is to be regretted that the time available has uot allowed such a fully detailed account as could be wished, but sufficient has been said and figures enough given to place the Siemens and Halske process within the category of practical precipitants of gold from cyanide solutions.

In the course of the short discussion which ensued it was stated that the costs at the Worcester worked out as follows: Filling and discharging, 10d. per ton; cyanide, 6d.; lime, 1.2d.; caustic soda, 5d.; lead, 1.1d.; iron, 2.2d.; native wages and food, 1.9d.; coal, 4.6d.; white labor, 4.6d.; stores aud general charges, 3.2d.—total, 3s.

Mr. Butters observed that the charges for white labor, *viz.*, 5d. per tou, were very high. They were only treating at the Worcester 100 tons per day. If they were treating 8000 tons per month instead of 3000 tons, the cost would be the same, and white labor should ouly be one-fifth of the present charge. The high rates were for white labor and coal. Coal would be nearly constant for additional plant; but while white labor would not be constant with a larger plant, coal would perhaps be a penny cheaper, and white labor would come down to a penny per ton instead of 5d. That meant a saving of 4d. per ton in larger works. In the case of MacArthur-Forrest process, the cost of zinc came to 2½d. on every ton. The new process had lead and iron and coal as heavy items against cyanide, zinc and coal in the MacArthur-Forrest process. Mr. Von Gernet had taken iron at 2.2d., but he had written the cost off by depreciation in one ycar; whereas it would last probably for three years, but all the costs they had taken at the outside. They thought the total cost would come down to 2s. 6d. per ton with an ordinary cyanide plant of from 6000 to 8000 tons per month. Of course, the gain of the process was in the lesser cost of the cyanide. Anybody could work at 4s. per ton, but they thought they could reduce that by 1s., or maybe 1s. 6d. If they could briug down the cost to 2s. there would be an enormous gain. As the boxes had only to be opened once a month, that represented a great advantage in various ways.

Mr. Lioucl Phillips, President of the Chamber of Mines, who occupied the chair, said the facts revealed in the paper were of a startling nature, and of the utmost importance to the mining industry.

Mr. Butters said that as for the royalty to bc demanded, he and probably his board, would be content with one of three per cent; lower rather than higher than that figure.

In accordance with the agreement recently entered into between the Bullion-Beck and Almo mining companies, of Utah, the development of the latter group has commenced in earnest. The members of the Almo company say they are certain that the main ore body of the Beck passes directly into their property and that the payments on the contract can easily be made within the next two or three months. The Almo people are to receive $150,000, payments to be made in installments equal to one-half of the net proceeds of sales of ore taken from the Almo ground, the Bullion-Beck Company to do all the regular development work. Each faction is to be represented by one agent, the two to choose a third as referee in case of a disagreement.

Electrical Progress.

Electrical Progress in the South.

A very interesting article on electrical development in the Southeru States appears in the current issue of the *Manufacturers' Record*. A brief abstract of the article follows:

The greatest wealth creator which this age or any other has ever knowu is rapid transit in the shape of electric or cable railways. As to the amount of rapid railroad building which the South has accomplished within a few years, the city of Baltimorc furuishes a most notable illustration. Three years ago every one of its street-car liues was operated by horse power, with the exception of one mile of electric road iu the northeru part of the city. At present horses are used on but one road in the city limits, and hy 1895 this will be rebuilt for electric operatiou. Since the date mentioned about 220 miles of track have been laid in and near the city for cable and electric motive power, on which about 600 electric or cable cars are operated, aud which require the power geuerated in nine large stations. These figures will give merely an idea of the investmcnt of capital in Baltimore alone in the street railroad business within three years.

But to show how generally Southern cities are provided with rapid transit facilities, the *Record* prints a list of sixty-two cities, all of which have oue or more electric lines.

In most of these cities the power plants, quality of roadbed and rolliug stock will compare favorably with the systems iu any of the municipalities in the country. Taking Atlanta for example, not a horse car is to be seen on its thoroughfares. The electric lines connect the business and manufacturing centers, hotels, railroad depots, theaters and churches with the priucipal resideuce sections in and beyond the city limits. On the Consolidated lines, which coutrol sixty-four miles of track, the rolling stock is from the best makers iu the couutry, such as the Pullman, Brill and Stephenson Works, while Corliss engines of the most modern type furuish the generatiug power.

Next to Baltimore, the city of New Orleans, La., has been the sceue of more electrical construction thau any other point in the South. Fully 100 miles of track will he completed by the end of this year. As in Baltimore, animal power was used exclusively in the city up to two years ago, with the exception of oue or two sections in the outskirts, on which steam dummies were operated. The New Orleans Traction Company, Canal & Claiborne Company, New Orleans & Carrollton Compauy, Orleans Company and St. Charles Street Railway Company have all let contracts for electric equipment. These corporations combined own 150 miles of road. Two of the companies have lines now operated hy motors. From January 1, 1893, to September 1, 1894, 391½ miles of electric railway were completed in Southern States. About 126 miles of electric railway are projected and under construction. The investmeut in these Southern rapid transit systems has found much favor in the North, and it is safe to say that over fifty per cent of the mileage has heen built by outside capital. A few instances of these investments may he cited. At Baltimore the Elkins-Widener syndicate of Philadelphia coutrols the Baltimore Traction Company's roads. The Lake Roland Elevated system, twenty-two miles long, was the result largely of capital placed through the Jarvis-Conkliu Mortgage Trust Company of Kansas City. The president and oue of the heaviest stockholders of the City and Suburban system is Nelson Perin, originally from the West. Murray Verner, the Pittsburg street railway operator, is building one of the Norfolk electric lines. Boston capitalists hold most of the bonds issued hy the Atlanta Consolidated Railway Company. The Jarvis-Conklin Company practically built Augusta's railway. New York baukers are heavily interested in several of the New Orleans lines heing supplied with rapid trausit facilities.

Up to January 1, 1893, 296 electric power stations for motor and lighting purposes were built in the South hy companies whose aggregate capital stock is $19,891,000. Since the time specified, the *Manufacturers' Record* shows that 166 plants have beeu completed or are in course of construction. These include the station of the Brush Electric Light Company, which replaces one burned, and which is valued at over $1,000,000; also the station of the Baltimore & Ohio Railroad Compauy for operating electric locomotives hy the trolley system. These plants represent capital stock of fully $15,000,000, making a grand total of 461 stations controlled by companies capitalized at $35,000,000.

This is what the South has done in the adoption of electricity as one of the great factors in its progress.

Transmission of Power.

The *Electrical World* says: Mr. Guilbert publishes in *La Lum. Elec.* a profusely illustrated description of a novel continuous alternating current trausmission system which has been iu regular operation for several months iu transmitting power from La Chapelle to Epinay, the inventiou of Messrs. Hutin aud Leblanc. In this plant a low tension, contiuuous curreut is couverted into a high tensiou three-phase alternating curreut by the machine called a "pauchahuteur;" these are transmitted over the linc and iu a similar machine are again transformed down to a continuous low tension curreut and used for charging accumulators for lightiug a railway statiou; the original coutinuous current voltage is between 110 and 170, the alternating current voltage is between 4000 and 5000, the line currents about one ampere, the distance almost five miles and the final voltage about the same as the original; the original curreut is from sixty to seventy amperes, and the final curreut from forty to fifty; the efficiency of the trausmission without consideriug the liue loss is hetween seventy-five and seveuty-eight per cent for about 12.5 kilowatts delivered at the farther end; iucluding the line losses, the total efficiency of the plant appears to be about sixty to sixty-eight per cent; it is believed that by making changes and improvements in the apparatus, the efficiency can be increased to ninety per ceut; the important loss of energy is that iu the motors, which can he greatly reduced if desired. The general principle of the transforming machines, which are similar to each other, is that the continuous current is transformed into a tri-phase alterуating current by means of a commutator driven by a motor, these currents being theu transformed into high tension currents. The article contains twenty illustrations showing the couections in the apparatus, several external views aud a large number of curves of efficieucies under various couditions. The receiving apparatus is driven by a synchronous motor, absolute synchronism being obtained by a special device; the moving of the brushes for different loads is accomplished automatically and there is said to be no sparking; the motor does not start hy itself, hut it is said that a few turns by hand are sufficieut; even this difficulty, however, can be overcome; it is helieved that the apparatus can be simplified very greatly, this being the first installation; he helieves this system can he used with success for considerably increasing the carrying capacity of feeders. Several tables giviug quite complete experimental data under various conditions are included.

The Storage Battery Problem.

At a recent meeting of the American Institute of Electrical Engineers, in Philadelphia, Mr. W. W. Griscom read a paper dealing with the storage battery problem. After devotiug a great deal of time to a recital of many phenomena which he had encountered in his study of the question, he said: "Perhaps the most striking peculiarity about the moderu storage hattery is the diversity of opinion among professional electricians as to its utility and commercial value. Men of the highest rank as electricians and engineers are ranged on either side of the question. Men of affairs, who have put them to a commercial test, exhibit a like divergeuce of views. Broadly stated, the European consensus of opinion, both technical aud commercial, may be said to be in favor of storage batteries. The American view until now has been mainly the opposite. What is the ground for this wide discrepancy? Why is cautious, conservative Europe so far ahead? Why is America a laggard in the running? The answer is not far to seek. Storage batteries are almost always an economical success abroad, while here they have been too often an economical failure in the past. And the reason is that the European always demands a margin for safety, while the American, with less capital aud keener competition, is temped to sail too close to the wiud. A storage battery continually worked to its commercial rating is a commercial failure. A storage battery worked sufficiently within its capacity is invariably a commercial success."

Electrically Operated Machine Tools.

At the engineering works of Messrs. de Wendel & Co., at Hayingen, Lorraiue, where merchant iron of great length is produced, a portable electric shearing machine has recently been put in operation. The shearing machine is of the ordinary type, driven by a "Henrion" motor, made by Fabius Henrion, of Nancy, France, takiug 75 amperes at 1.0 volt, and runuing at a speed of 800 revolutions. Both motor and shearing machine are mounted on a flat truck, running on rails. The same motor which serves to operate the shears is also used to move the whole arrangement to any part of the works where shearing operations are to be carried out.

Selby Smelting and Lead Company,

416 Montgomery Street, San Francisco.

Gold and Silver Refinery

—AND—

Assay Office.

HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.

Manufacturers of

BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.

Also Manufacturers of

STANDARD SHOT-GUN CARTRIDGES, Under Chamberlin Patent.

John Taylor & Co.

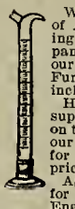
Importers and Dealers in

Assayers' Materials,

Mine and Mill Supplies.

Also Chemicals, and Physical, School and Chemical Apparatus.

63 & 65 First St., Cor. Mission, San Francisco.



We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.C. BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

TUBBS CORDAGE CO.

(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. ☞ Extra sizes and lengths made to order on short notice

611 and 613 FRONT ST., San Francisco, Cal.

THE JONES ROCK DRILL

IS THE

Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

JOBBING of every desoription promptly attended to.

FINE WORKMANSHIP GUARANTEED.

Also Pacific Coast Agents for the SHARPLES CREAM SEPARATORS.

Mechanical Progress.

Leakage of Steam Plants.

Waste of steam by leakage is a thing which may be expected in all steam plants, but it is too apt to obtain excessive proportions where it is believed to be trifling. Although attention has often been called to the matter, its importance cannot be too forcibly reiterated. Excellent engine performance way be secured by providing the required ecouomical type of construction, aud the highest economy in the generatiou of steam is obtainable by careful attention to the best principles of combustiou aud operation of boilers; but the consumptiou of coal is sure to he greater than it ought to be if some of the steam escapes from the plant by leakage, either from the boilers themselves, the piping or stop valves, or by passage through leaking valves and pistons in the engine cylinders. This very thing is one of the greatest objections to the use of high pressures, and it is in plants where high pressures are in vogue that the utmost vigilance should be exercised in this important matter. An instance may he referred to where leakage was going on to an excessive degree when it was least suspected. An excellent arrangement of steam piping was provided, says the *Engineering Record*, in which all the water of condensation found its way by gravity to one low point, where a separator was applied, the drain pipe of which led through a trap to an open exhaust steam heater. The steam trap, iufluenced by the action of the pressure, which iu this case was extremely high, failed to work efficiently, and it allowed a continuous eseape of steam unchecked, and, with the arrangement of discharge noted, undetected. The loss of steam at this one point was far in excess of any saving resulting from the high pressure which was carried, and vitiated the economy of a plant which would otherwise have been unexcelled.

It would well repay the eugine man in charge of a power plant if a thorough examination were made for leakage at regular intervals of say onec a month. It is an easy matter to determine the amount of leakage from the boilers and steam piping hy observing the fall of water in the gauge glasses when the engine is stopped, and the usual steam pressure maintained. If there is no loss the full height of water should he maintained continuously, or with practically no reduction. On the same occasion the valves and pistous of the engine should also he examined for leakage, which can easily he tried hy the indicator cock test, so far as this applies, and hy the time method when the other is unavailable. With systematic attention to these matters loss of steam hy leakage could not go unawares for a great length of time, and when found the proper remedy could he applied for its prevention.—Manufacturers' Gazette.

Hydraulic Forging.

Engineering - Mechanics says: The Brener-Schumacher process of hydraulic forging so fully developed in Germany has been introduced in England hy a Leeds concern, which has made a second press that does wonderful things. The press exerts a pressure of 700 tons, aud can make long and slow strokes or short and quick ones, as desired. A large steam cylinder is used instead of a pumping eugiue, the piston of which is prolonged and acts as a ram for exerting hydraulic pressure on the forging tools through the medium of a second hydraulic cylinder. *Engineering*, in speaking of the press, says: There are two steam cyliuders placed over the press to lift the forging crosshead, hy which the upper forging tool is carried. When it is desired to work in the ordinary way with heavy pressure, the admission and exhaust of steam in these lifting cyliuders is controlled by the same lever which regulates the admission and the exhausting of the steam in the large driving cylinder, but for quick working direct and uninterrupted communication is established by means of a separate cock between these lifting cylinders and the boiler. In this way there is then always the full boiler pressure beneath the cylinder, tending to keep the crosshead and upper tool at the top of the stroke, but the main steam cylinder, which puts on the forgiug pressure—through the hydraulic mechanism—is of so much greater area than the combined area of the two small cylinders, that the crosshead is pressed down with considerable force; although, of course, with less force than if the two lifting cylinders were exhausting in the usual way; in fact, the main cylinder has to work against a back pressure equivalent to the total steam pressure exerted on the area of the two lifting cylinders. It will thus be seeu that the two lifting cylinders are, in this method of working, always endeavoring to lift the crosshead, and immediately pressure is released from the main cylinder, they can do so. At the same time the pressure on the work is reduced, aud thus a very quick though somewhat lighter motion is obtained. As an example of the value of this feature it may be mentioned that a crank shaft can now be forged in one heat which would have formerly required three heats. The steel slabs nine inches by four inches are cut and sliced round and then drawn to twenty-four inches in length and three inches in diameter withiu six minutes of being placed on the anvil of the press. With regard to the forging of railway carriage buffers, the part to form the head is five and oue-half inches in diameter and six iuches long, to which is attached the two and three-quarters inch diameter shaft. The head is formed from the solid within two minutes from being taken out of the furnace to the time of leaving the forging dies. The heads as finished arc fourteen inches in diameter and five-eighths inch thick at the periphery, and, of course, thicker in the center.

Narrow-Gauge Roads Increasing.

Notwithstauding the great interest in narrow-gauge railroads in Europe about 1873, says the *Railroad Gazette*, few were huilt. Of late years, though there has been less talk, there has been more done. France is getting a considerable system of such roads, and Germany has huilt several. In the railroad statistics of the German Empire for the year 1892-93 there are reports from thirty-four such roads in operatiou, measuring in the aggregate 489 miles, which is three per cent of the whole railroad system. They had cost on the average $21,136 a mile. In Alsace-Loraiue, where they were cheapest, they had cost only $10,500 a mile; in Saxony, where they were dearest, $29,000. One line in Alsace cost but $4670 a mile, and onc Saxon mile, $43,000. The speed permitted on them varies from 5 to 18½ miles an hour. Their earnings are generally light, averaging $1920 a mile gross, but some have much larger earnings. The most profitable one is one of the costliest. On the average their net earnings were 2.19 per cent of their cost in 1892, and 2.3 in 1891. The sharpest curve is six feet radius on a spur to a hlast furnace. About one-third of the whole mileage is huilt on the highways. There is a station on the average to every 1¾ miles of track. One-seventh of all the railroads in Alsace are of narrow gauge, one-eighth in Saxony, and one-fourteenth in Baden; but only a very small proportion in the other German countries.

Cost Per Horse Power.

"Cost of an Indicated Horse Power" was the title of a paper read hy Decoursy May, of Niagara Falls, before the American Society of Mechaaical Engineers. Reliable data as to the cost of operating steam plants he found scarce, due partly to coucealment, but usually to ignorance. Reviewing a few estimates and papers which he found on the subjeet he reached the conclusion that one indicated horse power cannot be produeed for 365 days of 24 hours each for less than $40, with coal at $5 per ton of 2240 pounds. From such data as he was able to collect, allowing 5 per cent for interest on plant, 5 per cent for depreciation of plant, 1 per cent for insurance and 1½ per cent for taxes, making no allowance for rental or interest on the land occupied by the plant or cost of water, Mr. May presents a tabulated statement of the cost of running various types of power, both continuously and for only 10½ hours per day, with coal at various prices. For 308 days of 10½ hours each and with coal at $2 per ton of 2240 pounds, the cost of one indicated horse power is estimated by Mr. May as follows: Triple expansion pumping, Allis, 20 revolutions, $31; triple expansion, without pumps, Allis, 50 revolutions, $16; compound mill, best engine, $17; compound mill average, $22; compound electric light average, $78; compound trolley, $29; triple expansion trolley, $26; condensing mill, $25; non-condensing, 50 to 200-horse power, $49. With coal at $4 per ton the cost is increased from $4 to $12 per horse power.

221 and 223 First Street, San Francisco, Cal.

QUARTZ SCREENS
A specialty. Round, slot or punched slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron, Zinc, Copper or Brass Screens for all purposes. CALIFORNIA PERFORATING SCREEN CO., 145 and 147 Beale St., S. F.

GIANT POWDER FURE CAP FASTENER.

The instrument presented in the above cut is a new and grand little invention: being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.
MOONEY & SHERWOOD Fresno, Cal.

Practical Treatise on Hydraulic Mining.
BY AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Hitches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price $5, postpaid. For sale by THE NEWEY PUBLISHING CO., 220 Market St., San Francisco.

LIGHTNING LARGEST WELL MACHINERY Works.
All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

REOPENED.—Calaveras *Citizen:* The Basella mine has recently been reopened under the supervision of E. L. Burns.

We have been informed that operations have been begun upon the mine operated some time since by Colon Campbell of Oakland. Jos. Heinsdorf of Oakland is superintending the reopening.

Inyo.

SOUTHERN INYO MINES.—*Register:* From parties who have visited the mining locality south, we have the following summary:

Some fourteen miners are at work at Cerro Gordo, mostly on the old dumps. The total shipments foot up to something over five tons every day in the week. Owing to the low price in silver the margin for profits on this output in not at all large. Tom Boland is the principal operator.

At the soda works at Keeler new work is mostly suspended since the summer's crop has been gathered. At a rough guess there are some 3000 tons piled up. A very complete and obviously quite a costly calcining or refining furnace is being erected by Supt. Wrinkle, and it is expected to be ready for work in less than a month from the present time.

At Darwin nearly forty men are at work, the larger number in the Sorba or Lane mine. This mine "goes down," and is yielding handsomely, keeping one thirteen-ton team hauling constantly to Keeler.

The Defiance, under Capt. E. A. Reddy, is working but a small force. It is yielding finely but a large proportion of the ores are of a grade that will pay hut little at the present price of silver, so none but the high grade ores are being shipped. On the whole this property is doing very well.

At old Coso several men are working to reopen the gold ledges of that somewhat famous old camp, but with what result we are not informed. Joe Danielson, once of this locality, is one of the prospectors.

Low silver has nearly depopulated Panamint, where until recent months some thirty men or more made a good living, if nothing more, in chloriding.

NOTES FROM SOUTHERN INYO.—*Independent:* The Soda Company will furnace several hundred tons of soda as soon as a supply of wood can be obtained.

It is rumored that the force of miners at the Reddy mine at Darwin will be cut down, on the first of November, to a few men, probably three or four. The mining outlook continues favorable there.

Pat Clinton has secured a contract to sink the Newton shaft, at Cerro Gordo, one hundred feet deeper, and is having a carload of timbers hauled up the hill by Horace Elder's team of Lone Pine. Mr. Gus Stecker, of Independence, will do the carpenter work for Mr. Clinton.

Nevada.

WASHINGTON MINING MINES.—Nevada City *Herald:* John McCarthy has bonded the St. Patrick ledge to Henry Phillips, superintendent of the Mountain View mine, and development work will probably soon be commenced. This ledge lies directly across the river in front of town, and is on the contact of the serpentine and slate belts. Like the Giant King, which is on the same lead, it is an immense vein, being ninety-two feet in width. Mr. McCarthy has made three test crushings of the rock taken at random and reports a yield of $2.45, $2.50 and $5.30 respectively per ton. Though low grade ore it is estimated that at these figures it can be made to yield large returns, for the work of extracting and milling can be done at a very low cost.

D. P. Stewart and Captain D. S. Donohue, owners of the Maryland mine, on McCall ravine, three miles from Washington, are greatly elated over their fine prospect. A test crushing of thirteen and a half tons yielded $250. The lower tunnel is now in 300 feet and a crosscut made on the ledge. A raise has also been made to the surface from the upper tunnel.

Charles Phelps, owner of the Phelps Hill gravel mine, reports that he now has the main drift into the channel proper, and the nuggets taken out are such as reminds the '49er of "the good old days." Mr. Phelps is the owner of 320 acres of placer ground which, if worked by the hydraulic process, it is believed would prove to be another Alpha or Omega. The claim is thickly covered with some of the finest timber in the State.

W. W. Waggoner has lately made a survey of the Giant King ledge and tunnels. According to the survey the company will have to run about forty feet yet before they strike the foot wall of the ledge with the lower tunnel, which will make the entire distance 468 feet.

J. H. Smith has struck some fine placer ground on Gaston ridge. He has not developed the claim much yet, but the prospects obtained show that the early days miner did not get it all. Some beautiful specimens have been taken out, one piece weighing about $85, and several others exceeding an ounce in weight. The ground is shallow and can be easily worked by the sluicing process, but on account of the lack of water, at present Mr. Smith is working it by drifting.

Samuel J. Alderman is making a survey of the Gambrinus mine for John McBean & Co., and while here will also survey some timber land for Conrad Grissell of Nevada City.

MACHINERY STARTED.—Grass Valley *Union:* The machinery at the Independence mine has been started up and works very nicely, reflecting great credit on H. L. Body, who had charge of operations. The work is very compact and strong, the gallows frame being one of the most substantial in this district. It is built of fourteen-inch timber and is thirty-four feet high.

The hoisting for the present, while the shaft is being sunk, will be done by means of a bucket, but preparations have been made for a cage as soon as the shaft is down. The pump is ready to start but is not needed as yet.

Mariposa.

IMPROVEMENTS OF THE SIERRA BUTTE COMPANY.—Mariposa *Gazette:* Much activity prevails at Whitlocks where the Sierra-Butte company have their headquarters in this county. It was late in the season when they came in possession of this property, and it is a long distance to saw mills, but nothing has deterred them, and everything is being put into perfect order, which shows the permanency of their intentions. Lumber is being hauled to the plant as fast as it can be supplied at the mills; cottages for the workmen, a boarding house large enough to accomodate eighty workmen, and an office 44x25 feet are all under construction. The office is two stories high and will be nicely finished in surfaced lumber.

The plan of the mill which is to be built this winter shows a capacity for forty stamps, but at first only twenty 1000-pound stamps will be put in. The most improved concentrators will be used, in fact all of the machinery will be of the best kind it is possible to obtain. A Cornish pump and engine have been put in at the Alabama and this mine is being made ready for work, and by the beginning of winter both the Whitlock and Alabama will be ready to show what is in them. Just now one of the largest shafts ever sunk in this county is being sunk on the Whitlocks. It is a three compartment shaft, 16x6 feet, and will be a triumph of mining engineering when completed. With the exception of this shaft nothing else in the way of prospecting is being done just now. Repairing and timbering is called dead work, and that is what has to be done always before more extensive tunneling or sinking can be done. The lower tunnel has been enlarged under the new management, and sufficient work has been done to convince them that they have a mountain of good ore to uncover. A great deal of ore is now on the dumps, and by the time the mill is ready to run, many active miners will be at work underground and the busy Burleigh drills will be tearing out tons of good quartz.

The Sierra-Butte company show their faith in our section of the country by the investments they have made here and near us. In addition to what they have in this county, they have purchased an extensive mining property just over the border in Tuolumne county and have a forty stamp mill about completed, and are spending a great deal of money in improvements there just as they are doing in Mariposa. The gentlemen in charge here are all practical mining men perfectly conversant with all matters pertaining to their business, and we are all heartily glad to have such people indentified with our interests.

Plumas.

OF THE DEBRIS COMMISSION.—*National-Bulletin:* On Saturday, Lieut. Gillette, secretary of the California Debris Commission, reached Quincy, and, with A. W. Keddie, C. E., departed on a visit to the Northern Placer, Tefft, Squirrel Creek, Yankee Ravine and Mohawk placer mines, where restraining works have been constructed in pursuance of instructions from the Commissioners. The examination was made by Lieut. Gillette, and he departed for San Francisco on Monday via Reno, Nev.

Shasta.

COAL.—*Cause:* Extensive coal deposits have been discovered about twelve miles from Bartles, on the McCloud river, Cal., embracing ten square miles of territory. Several claims have been taken up. The coal is of good quality. Work will be commenced immediately toward developing the new find and will consist of several tunnels and shafts. A wagon road will be built from Bartles to the site at an early date, and if surface indications amount to anything, the coal deposits are something great. The coal is bituminous and burns very freely, having little or no shale in its composition.

Sierra.

SIERRA CITY.—*Mt. Messenger:* Times are still on the improve here, and most of the miners are working. Main street is crowded with freight wagons loaded with winter supplies for the stores and mines.

There are forty stamps running at the Bonanza ledge. The pay chute is thirty feet wide, and the owners claim there is sufficient ore available to last for twenty years or more. Geo. Black is amalgamator and one of the best. Geo. M. Pinney, who owns half of the property, is still here and intends remaining for some time. This is one of the most extensive and promising ledges in Sierra county, and will be thoroughly developed for all that it is worth.

Siskiyou.

GRAVEL.—Yreka *Journal:* The Spangler Brothers have worked up Humbug creek from its mouth to the old works, where the old drain has been opened, letting out the flood of water, which will require a few days to run off. They found excellent prospects along the bedrock before reaching the drain, and as soon as the bedrock water runs off, to permit digging and hoisting again, they will be able to take out rich paying gravel in great abundance.

W. Larison, engineer of the machinery at the Spangler mine on Humbug creek, is in town this week, waiting for the water to run out of the drain at the old works just tapped.

The river miners on the Klamath are now very busy hoisting pay gravel, and will continue to take out considerable gold dust until the winter storms of December set in. The Benz Bar claim, at Honolulu, is probably paying the best of any claim on the river. Good prospects have been discovered at the Beebe Bar mine, a short distance below the mouth of Humbug creek, with indications of good pay from now on, until winter storms interfere with operations.

NEVADA.

Washoe District.

SIERRA NEVADA.—Virginia *Enterprise:* During the week we have placed the car track and air pipes in the face of the intermediate tunnel and advanced the tunnel 14 feet; total length, 567 feet; face in porphyry with seepage of water.

The northwest drift, at a point 160 feet west from the mouth of the Layton tunnel, is out 164 feet; advanced 36 feet during the week; face in clay and quartz giving low assays.

S. N., M. & U. SHAFT.—The east crosscut from the north lateral drift, 450 feet north of the west drift, 1520 feet west of the shaft, 900 level, has been advanced during the week twenty-six feet; total length, 164 feet; face in quartz.

The west crosscut from the Union Con. south lateral drift from the west, 1520 feet west of the shaft, 900 level, has been extended twenty-four feet during the week; total length, 195 feet; face in clay and porphyry.

UNION SHAFT.—On the 900 level of this mine the east crosscut from the north lateral drift, 450 feet north of west drift, 1520 feet west of shaft, has been advanced during the week twenty-six feet; total length 164 feet; face in a mixture of quartz. The west crosscut from the Union Con. south lateral drift from west drift, 1520 feet west of shaft, has been extended twenty-four feet during the week; total length, 195 feet; face in clay and porphyry.

SAVAGE.—On the 1100 level in the north lateral drift, started from the east drift, they continue to extract ore from the sill floor upward to the seventh floor, and ore of fair grade is also being stoped from the south drift from the east drift on the same level. During the week we have hoisted fifty-seven cars of ore, the average sample of which assayed $29 per ton. On October 24th they resumed shipping ore to the Nevada mill and 225 tons were shipped during the week. The mill began crushing the ore on the 27th, but owing to interruptions caused by repairing the water company's flume only seventy-five tons were milled.

CHOLLAR.—On the 550 level our north drift from the main west crosscut has been cleaned and repaired for a distance of forty feet.

The winze from the 450 level, thirty feet south of the north line, is now down a distance of thirty-six feet; the bottom shows a width eleven feet of ore, face samples from which run from $25 to $55 per ton.

We have extracted from the winze and from the old stope on the 450 level during the past week 193 tons and 1,600 pounds of ore, the average battery samples of which was $39.11.

We have shipped to the Carson Mint 325 pounds of crude bullion.

POTOSI.—The winze from the 450 level, 200 feet south of the north line, is down forty-eight feet; the bottom is in porphyry with a streak of low-grade quartz showing pay.

The south drift from the main west crosscut, 550 level, has been extended to a total length of seventeen feet.

We have resumed work in the face of the northwest drift from the shaft on the surface, which is now out a total distance of forty-seven feet; face is in quartz of low grade on the average.

CROWN POINT.—The south lateral drift on the 500 level has been advanced for a length of forty-four feet south of crosscut No. 1. The face continues in porphyry, clay slips and quartz of no practical value. During the past week we have extracted from the stopes above the 600 level and from the openings between the 600 and 700 levels 616 tons and 220 pounds of ore, which has been shipped to the Mexican mill for reduction. The average battery sample for the week was $9.53 per ton, of which $8.68 per ton was gold.

BELCHER.—Seventy tons of fair-grade ore has been hoisted during the week.

Prospecting continues on the 300, 350, 400, 600, 1000 and 1100 levels.

Tuscarora District.

NAVAJO.—Tuscarora *Times-Review:* No. 2 crosscut on the 150-foot level has been extended six feet. Rock still hard in the face.

BELLE ISLE.—North drift on the east vein, 250-foot level, has been extended nine feet, showing no change. South intermediate drift, same vein and level, is in fifteen feet. The face is in low-grade ore. The stopes are looking fairly well and are yielding the usual quantity of ore.

Kennedy District.

CYANIDE PROCESS.—*New Era:* C. E. Kennedy, the discoverer of this camp, has been making practical tests, in ton lots, of the surface ores by the cyanide process. He saves ninety-five per cent of the gold and thirty per cent of the silver by using a three-quarter of one per cent solution and giving twenty-four to thirty-six hours' time.

The Shamrock Company are in ore in their long tunnel, and it is thought they are just

The Annual Convention

OF THE

California Miners' Association

WILL BE HELD IN

SAN FRANCISCO,

MONDAY.....November 19th, 1894.

Questions of importance to the Quartz, Drift and Hydraulic Mining Industry in California will be considered, and County Mining Associations are requested to appoint delegates at once.

Our Senators and Congressmen are expected to be present at this Convention and the Miners of the State will have an opportunity of bringing before them such matters as affect the welfare of the Mining Industry.

Place of meeting will be published later.

EXECUTIVE COMMITTEE CALIFORNIA MINERS' ASSOCIATION.

By WM. C. RALSTON, Secretary.

OUR PIPE

IS FOR SALE.

For Hydraulic Mining and Irrigation Purposes Our Sheet Iron and Sheet Steel Riveted Water Pipe Is Unexcelled.

We Have Also a Large Line of the MATHESON JOINT (Lap-Welded) Pipe, for Which We Are Agents.

Our Prices Are Low; Our Pipe Is Superior, and We Want More Business. May We Quote You Prices?

PIPE FITTINGS, TOO.

RISDON IRON WORKS,

SAN FRANCISCO, CAL.

entering the fourteen-foot vein which is exposed in their upper works. Tbis vein averaged $18.50 in gold, carrying uo silver.

Wiggins & Wilson have three wngons loaded with ore on the road to Winnemucca, which is the first of a fifty-ton shipment consigned to smelters at Snit Luke City. The ore is valued at $120 per ton in gold, and has been taken from the ledge without sorting.

The clean-up at the Imperial mill last Thursday gave the best results yet obtained, and the management is correspondingly elated.

When the Jenkins mill completes the reduction of Crown Point ore, the plant will receive Pride of the Mountain ore exclusively.

Dave O'Neal and partners are having 130 tons of Crown Point ore reduced at the Jenkins mill.

The new Imperinl north drift in No. 1 winze is in six feet of high-grnde ore, which would give a profit even to ship.

OREGON.

THE COLUMBIAN.—*Bedrock Democrat:* The Columbian mine, the property recently purchased by Chicago people from Messrs. Gorman and Reynolds and situated northeast of the Virtue mine, is proving to be a great property.

Mr. Toppy Johnson, the superintendent of the mine, brought in last Sunday samples of ore from the lower level which shows free gold profusely taken from a ledge fully eight feet in width. Mr. Johnson disposed of his one-third iuterest in the property a few days ago and now he is sorry for it. He says the mine will undoubtedly prove to be one of the greatest gold propertios in the northwest, and being in tho hands of a company with ample meaus to operate it will become a big producer in tbe near future.

HYDRAULIC MINES.—Rogue River *Courier:* Collis & Wickstrom started their hydraulic works in operation at the Dry Diggings Saturday.

Bailey and Miller have just finished setting up 1000 feet of hydraulic pipe on their placer on Missouri Flat, not far from the Mountain Lion mine.

Messrs. Spencer & Gunning have put about 2000 feet of hydraulic pipe in position to play ou their placers at Bloody Run this winter. The diggings are just back of Ole Severson's place and are known to be rich.

F. F. Johnson, formerly landlord of the Palace hotel, camo in from Oak Flat this week and reports the work of building a three-mile ditch progressing favorably. He and two other miners are interested in the project and have a good placer mine awaiting the water which comos from Soldier creek with a fall of 200 feet. The bank averages fifteen feet to the bedrock and prospects well from the grass roots down. The scene of operation is down the Illnois river twenty-five miles from Kerby and fifty from Grants Pass the road you have to travel.

SPARTA.—*Bedrock Democrat:* Mr. C. D. Reed shipped somo of the famous Dutchman ore from Paddy creek to Everett, Washington, last Thursday.

Mining men from all over the country are taking an interest in and around Sparta. More sales have been made this year than for twenty years past.

Messrs. Wood, of the Crystal Palace group, have twelve meu at work and intend to put on quite a force as soon as buildings are erected to accomodate them. Their foreman came from New Mexico to take charge.

Messrs. Clough, Wilson & Co. have running on Eagle creek the neatest arrastra in the State of Oregon, and have just completed a run that gave very fine results.

Par Long, on Lower Powder, has been steadily developing his property and now bas in sight a fine body of rich ore.

Several mining transfers took place last week, Mr. Chamberlain buying his partners out. They have done very well this season.

Messrs. Hook and Chas. Durkee are drifting on good ground and are putting in supplies for the winter.

Dr. Jay Guy Lewis is expecting the McGee machinery. The process of working is extremely simple and cheap and the good doctor says it will revolutionize mining hase ores.

Coast Industrial Notes.

—There are twenty-two teams engaged in hauling freight from Nevada City to the mountain towns above.

—The Nevada City trustees are going to huild an iron bridge across Deer creek to replace the wooden one which broke down the other day.

—The Reno *Journal* says that M. O'Brien, the mill furnisher of San Francisco, has gone to Carson and Douglas county, to see ahout building two flour mills in that part of Nevada.

—In England in 1886 there were 619,106 miners. In 1892 there were 963,000. The reason of the increaso is that many agricultural laborers, finding it difficult to get work in their line, have become coal miners.

—J. J. Holmes, of Hawthorne, has secured the contract for grading and laying nine miles of track for the Mohawk and Sierra Valley Railroad Company. The road connects with the Nevada and Oregon, and is designed to tap the sugar pine regions of Sierra county.

—The Sloan & Haskell mines at Susanville, Oregon, recently purchased hy an Eastern syndicate, are to he operated on a more extensive scale than ever the coming year. A large shipment of hydraulic pipe is en route from San Francisco and will arrive shortly.

—The *West Coast Trade* says that the Detroit Dry Dock Company has been investigating the opportunities for establishing ship yards on Puget Sound for some time, and E. L. McAllister is now there with the intention of locating an engineering office eitber at Tacoma or Seattle. If the investment pays, a compauy will be formed in the near future for the purpose of building vessels on an extensive scale.

—Messrs. Ellis & Cupid, of Nevada, bave bought the Rembol & Young gravel mine nt Sumpter, Oregou, and will develop it on a large scale. They have ordered from San Francisco 80,000 pounds of twelve-inch hydraulic pipe, and an electric dynamo for the lighting of mines for night work, and new machinery for the sawmill.

—A new market has been found for California hops, which are now quoted at a lower rate than ever before known in the history of the State. For the past three months every steamer that has sailed hence for the Orient has carried shipments for Calcutta. The steamer City of Peking, on her last trip, carried for the city on the banks of the Houghly 28,677 pounds, valued at $2700.

—The local coal trade for domestic uses is increasing daily, as the late storms have caused housekoepers to replenish their coal hins. Housewives who figure closely their cost of fuel cannot complain this year, as all grades of coal are lower than for yoars past, with every indication of no advanco this winter. Tbere have heen very liberal arrivals of foreign coal recently.

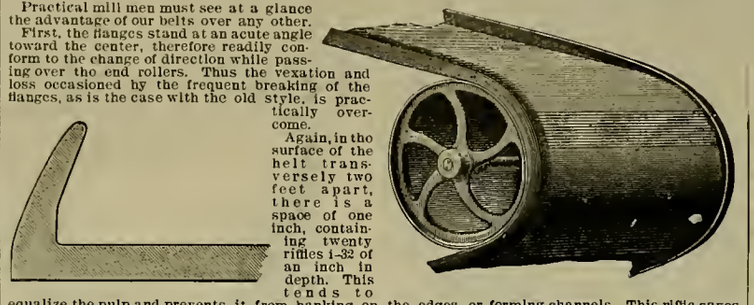
Blasdel Improved Concentrating Belt.

We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machines, and make all lengths and widths to order.



Practical mill men must see at a glance the advantage of our belts over any other. First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned hy the frequent breaking of the flanges, as is the case with the old style, is practically overcome. Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escapo with the taillngs from a belt with an entirely smooth surface.

Scientific Progress.

The Merits of Different Types of Ships.

Charles H. Cramp, in reply to a New York *Herald* correspondent relative to the report that a Chinese armored ship has been sunk by one or more unarmored Japanese cruisers and as to whether the fact is an argument against armored ships, said:

"I do not consider it any argument at all. In the first place we do not know what the facts are. The statements received thus far are too meager to base even a surmise on. Probably all the facts and all the conditions will never be known. Certainly they will never be known as accurately or as analytically as if the engagement had been between European fleets. The discussion you speak of cannot be intelligent in the absence of information. I think you will find some men who have fads are trying to make out a case in their favor—that is all. You may expect that always. For example, when the Blanco Encalada was sunk by a torpedo during the Chilian revolution every torpedo boat enthusiast declared that the death knell of battle ships had been sounded. When all the facts came out, it appeared that the Encalada was perfectly helpless, being moored and having her machinery disconnected, with some parts of it on shore for repairs. She was, therefore, simply a target. To sink her with a torpedo under such circumstances was not much more of a warlike feat than blowing up a derelict. Now, on the strength of meager and conflicting reports that a Chinese armor-clad has been sunk by a Japanese cruiser, another fad gets an airing. But whether we ever get accurate information or not about the details of this affair, it is safe to assume that the fact of any ship being sunk in this Oriental war will not conclude anything as to the merits or faults of the type. Both the Chinese and Japanese, though they have made great progress, considering their opportunities for practice, in naval manœuvres, are still far behind the Western nations. This is particularly true with respect to the more recent ships, with their complex construction and intricate machinery. The Chinese make good sailors, and with sufficient practice and training would develop capable officers. But they have not had any modern ships with which to train and practice until recently. The entire system of modern naval warfare, both mechanical and tactical, is new to them. In fact it is new to everybody in the practical sense. Admiral Sir George Tyron was considered the ablest man in the British navy. At any time before the loss of the Victoria it would have been considered in England almost heresy to doubt his mastery of seamanship. Yet he committed the greatest and most fatal blunder in the history of naval manœuvres. Now, when such things are possible with the ablest officer in the British navy—at least such by prior reputation—what must we not expect from Chinese, who, perhaps, never saw the inside of a steam battle ship until a few years ago? The man is everything in modern naval warfare. The ship becomes, with each stride of improvement, more and more a machine, a tool. This is as true of this country and Europe as it is of the Chinese and Japanese. The man must have a ship, and, of course, the better and more powerful the ship the greater the execution that the competent man can do with it; but to jump at conclusions as to the merits of different types of ships, or to rush into print, as some so-called 'experts' are doing, with alleged 'professional opinions' on the basis of the fragmentary and contradictory information that we now have is rankly absurd and should be exposed to ridicule and derision. For these reasons, I say that the naval events of this Asiatic war can prove nothing as to the relative value of types of vessels."

Sunlight as a Disinfectant.

Two important series of experiments have been in progress for some time upon the action of sunlight as a disinfectant. Professor Marshall Ward has demonstrated the bactericidal action of light, and this subject has also been dealt with from a scientific aspect by Percy Frankland. Professor Buchner has endeavored to carry these facts into practical account, and has found that in water typhoid and other cultures have been completely destroyed by bright sunlight in three hours. Diffused daylight has had the effect of rapidly reducing them, although if placed in darkness thereafter a rapid increase was noted. To determine the depth at which this action ceases, partially exposed cultures of different germs were sunk in Stamberger lake, near Munich. At three yards below the surface the retarding effect was just perceptible, although it is known that light penetrates water to depths as great as 185 yards. It is apparent, therefore, that the effect of sunlight in the purification of rivers has been overestimated, and that it is confined to the surface. The action is really due not to bactericidal influence, but rather to the life-struggle between pathogenic and non-pathogenic organisms and the survival of the latter, together with a breaking up of those forms of life prejudicial to the continuance of human life upon this planet. Professor Esmarch has also used sunlight as a disinfectant for fibrous wearing materials, and has found that the heat liberated by the absorption of light waves upon a dark surface must be taken account of. His experiments demonstrated surface action of light and little more. At the same time a carbolic-acid two-per-cent spray proved but little more efficacious in checking the development of germs in the deeper parts of such materials or beneath the surface of skins, or in fur, where the bacillus of diphtheria was present.—Industries and Iron.

Foreign Work and Schemes.

Where cotton goods are woven it is customary to put the warp threads through a machine known as the "slasher" to stiffen them with size, so that they will be less liable to become tangled in the loom. Hitherto the size has been hot when applied. A machine invented by Johann Maag, of Winterthur, Switzerland, uses the preparation cold, but first subjects the threads to a current of moist air to render them more open to the reception of the size.

Ventilation will be effected in the great hall of the new Sorbonne in Paris by keeping the walls at a higher temperature than the rest of the room, and thus developing ascending currents of air along their surfaces. Air heated to a temperature of 200° is brought to a conduit behind the molding along the floor, and the walls themselves, it is expected, will thus be heated to 100°. Some of this warm air will be forced into the auditorium through small holes covered with netting.

At a recent meeting of the Paris Academy of Medicine, Dr. Hallopeau read a paper affirming that moderate exercise on a bicycle does not interfere with the action of the heart, except where there is some aortic or valvular affection. On the contrary, it is highly useful in promoting the action of the skin and lungs, developing the muscles, augmenting the appetite, facilitating digestion and stimulating general nutrition.

The use of cordite in small arms in the British service has been found dreadfully destructive of the grooves inside of the barrels. Experts declare that after five years' service a rifle is thus converted into a smooth-bore.

In a pneumatic bridge used on the Weser last summer a sort of harrow loosened the earth on the river bottom, and a jet of compressed air stirred it up and set it floating down stream with the current. The same system has also been tried with success in the harbor of Algiers, and at the Tidbury docks, London.

Enough of the new Siberian railway to reach Omsk, which is 4400 miles from St. Petersburg, has been completed. While construction was going on across an extensive bog, 4000 masks were provided for the men, besides burning juniper to create a smudge, as a protection against mosquitoes.

Inoculation for diphtheria with serum, derived from the culture of germs in modifying media, has been tried lately in France as well as other countries, and has been found a great protection against the malady itself.

A rough diamond from South America has been brought to the United States which is shaped exactly as if cut, which suggests the theory whether man has unconsciously been imitating nature, or nature imitating man's work. George F. Kunz, Tiffany's specialist in gems, declares that this specimen shows no evidence of being tampered with.

An Englishman has devised a scheme for leading obnoxious fumes from sewers up into the gas-lamps of the street and there burning them. Not only is health thus guarded against a dangerous poison, but the luminosity of the gas-flame is increased.

Practical Information.

Difference Between Brussels and Tapestry.

By placing the two side by side, a clearness and sharpness is noticed about the Brussels pattern which is absent from the tapestry. In the latter there is a mistiness about the colors, and the pattern lacks that sharpness and delicacy which characterizes the former. This is due to the process of manufacture. A Brussels is a yarn-dyed and a tapestry may be described as a printed fabric, but the printing is done upon the yarn, before the process of weaving. The whole method of manufacture is most ingenious. In the making of a five-frame Brussels no fewer than 1280 ends of face yarns are required for the weaving of one piece of standard quality—each frame consisting of 256 bobbins, and 256 ends only can come to the face at each pick of the pattern. Therefore, 1024 ends of yarn are hidden in the body of the fabric. There are many qualities of tapestry, but in the production of the standard quality only 216 ends of face yarn are required, instead of 1280, which shows at once that the Brussels carpet has the great advantage of being thicker, softer, and altogether a more durable cloth, apart from other advantages which it possesses. There is a limitation in the number of colors used in a Brussels. In tapestry there is no limit. In the Brussels, the whole of the colors used show a more or less striped appearance at the back of the fabric; in a tapestry they do not show at the back at all. This fact is made use of by householders in purchasing carpets, this being about the only way the average person can tell the difference between them. In order to pass off tapestry as Brussels, some ingenious makers have resorted to the striping in a regular manner of the backs of the former. The stripey effect in the latter is broken and irregular. A casual observation of the clearly-defined character of a Brussels pattern should enable a buyer to distinguish between the two fabrics.—Manufacturers' Gazette.

How to Select Rope.

A German paper, in an article on the methods of rope manufacture from hemp, and the determination of the different qualities and the probable strength from the appearance, lays down the following rules: A good hemp rope is hard but pliant, yellowish and greenish gray in color, with a certain silver or pearly luster. A dark or blackish color indicates that the hemp has suffered from fermentation in the process of curing, and brown spots show that the rope was spun while the fibers were damp, and is consequently weak and soft in those places. Again, sometimes rope is made with inferior hemp on the inside, covered with yarns of good material—a fraud, however, which may be detected by dissecting a portion of the rope, or in practical hands by its behavior in use; other inferior ropes are made with short fibers, or with strands of unequal strength or unevenly spun—the rope in the first case appearing woolly, on account of the number of ends of fiber projecting, and in the latter case the irregularity of manufacture is evident on inspection by any good judge.

Manganese Steel.

Ordinary manganese steel, containing thirteen per cent of manganese, is not magnetic, but is made so by annealing at a high temperature. M. Le Chatelier has found that the transformation is effected in one or two hours at about 550° C. By heating the magnetic metal to about 800° and rapidly cooling, it is changed back into the non-magnetic variety. The steel is the more malleable the more energetically it has been tempered. At ordinary temperatures the electric resistance of the magnetic steel is much less than that of the other, which is the highest of any of the alloys of iron, but at about 740° the resistance of the two is the same. This is also the temperature at which ordinary iron loses its magnetic properties, and M. Le Chatelier therefore concludes that the alloy consists of a mechanical mixture of ordinary iron with a definite compound of iron and manganese.

Superheated Steam.

Between 1860 and 1870 superheated steam was very extensively adopted, especially for marine engines. After 1870 its use was soon discontinued. The reasons for this, writes Prof. W. C. Unwin in *Cassier's Magazine*, were probably these: (1) As the steam pressures used were increased, the range of superheating possible within the limit of danger to the lubricant was decreased, and the advantage of superheating correspondingly diminished. (2) The large superheaters in the uptake proved, in some cases, to be dangerous and liable to become overheated. (3) As the designing of steam machinery became more a matter of routine, and competition reduced the profits of engine building, the construction of engines fell into the hands of engineers who understood the action of the steam less well than the engineers who introduced superheating in 1859-60, and who regarded superheaters as unnecessary complications which it was convenient to abandon.

Diamond Saws.

Diamond saws for laboratory purposes could be made by taking discs of ordinary sheet tin six inches in diameter fitted on a lathe axle. Two circular pieces of wood are prepared five and a half inches in diameter. Between these the tin disc is set, and the whole is clamped to a vice. The edge of the tin disc is then notched by a knife in a direction slanting to the plane of the disc, the notches being as close together as possible and about a tenth of an inch in depth. The grooves so formed are filled with a mixture of finely powdered diamond dust mixed with some oil to form a stiff paste, and the teeth of the notches are then flattened, holding the diamond powder rigidly. Such a saw can do valuable work in a laboratory where crystalline rocks have to be sliced, and may be conveniently driven by a small electromotor.

No. 8 ...THE COMET CRUSHER OF

FRASER & CHALMERS is brought again to the FOREGROUND by the decision of the U. S. Supreme Court, May 19, 1894, concluding a long course of litigation between makers of the Gates Crusher and Fraser & Chalmers in favor of Fraser & Chalmers, and all costs and expenses to the makers of the Gates Crushers.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 8, 1894.

Local dealers prophesy an immediate advance in the price of quicksilver. Rail shipments overland for the first nine months of '94 aggregated 7511 flasks, worth $248,051. The shipments for the corresponding period in '93 were 9344 flasks, worth $384,896. The receipts here for October were 1680 flasks. During last month the sea shipments from here were 1419 flasks, worth $43,962. Of this, 1000 flasks went to New York and 317 to Mexico. From Jan. 1st to Nov. 1st there were shipped 12,655 flasks, worth $383,161.

Silver has varied but little during the week. The London *Financial News* says that "quite a dead set is being made at the once universally acceptable Mexican dollar. The British dollar now in course of preparation will shut it out of the Straits and Hong Kong. Santo Domingo has demonetized it, and now Spain is going to send over 10,000,000 pesetas in Spanish piasters to Porto Rico as a substitute for the Mexican dollars, which form the main portion of the currency of the island. The Bank of Spain is to provide the coin to effect tbis exchange, the reason for which is not very apparent."

The finance committee of the Spanish Cortes has decided to establish a gold standard of currency for Porto Rico. The Mexican dollar will hereafter be used only as a basis of weight for the value of silver.

The unusual character of the transfers of gold between March and October of this year, owing to the great demands for export, has led the Treasury Department to prepare a statement showing the amounts of such shipments during the period in question. According to the statement the following transfers were made: To New York—From Washington, $12,000,000; from Baltimore, $4,500,000; from Philadelphia, $3,600,000; from Boston, $500,000; from Cincinnati, $11,500,000; from Chicago, $5,000,000; from St. Louis, $5,500,000; from New Orleans, $2,000,000; from San Francisco, $7,500,000; from the Philadelphia mint, $69,960,000; from the Denver mint, $950,000; from tbe San Francisco mint, $7,500,000; from the Carson City mint, $2,000,000. From the Philadelpbia mint.—To Washington, $3,000; to Philadelphia, $4,100,000; to Boston, $5,900,000; to Chicago, $500,000. From the San Francisco mint to St. Louis, $1,000,000. From the New Orleans mint to New Orleans, $1,100,000. From New York to Boston, $250,000. These figures show a total of $145,663,000; transferred at a cost of $91,624. In addition, there was shipped from banks to Treasury offices $1,644,500; costing $1,856; making a grand total of transfers of gold of $147,307,500; at a total cost of $93,480.

This gold is going out of the country at the time when it generally comes in. In October, '93, the excess of gold imports was $1,072,919; in the same month of 1892 it was $2,634,080; in 1891 it was $16,088,352; and in 1890 it was $2,196,403. The excess is largely on the other side this year.

Reports to the Director of the Mint show that coinage for October was: Gold, $2,911,800; silver, $1,217,000, of which $600,000 was standard dollars; minor coin, $23,900; total coinage, $4,152,700.

The amounts and descriptions of specie shipped from here for the first ten months of '94 are as follows:

Silver bars	$5,857,376
Mexican dollars	4,559,130
S. Amer. dollars	150,872
Gold coin	12,301,507
Silver coin	592,140
Gold dust	1,661
Currency and bonds	1,447,287
Total	$24,909,973

Mining Share Market.

SAN FRANCISCO, Nov. 8, 1894.

The miniug share market has been affected by the election excitement, the same as other branches of business. Transactions have been rather light and fluctuations insignificant. On Tuesday no session of the Board was held. The average car assay of the ore from the new ore body in the Cons. California and Virginia mine is $67.70. The company will have sufficient surplus on band after paying all bills for last month to pay four dividends, of 25 cents per share each, nnd by the time tbe first dividend is paid the connection between the winze and the C. and C. shaft on the 1750-foot level will be made and the output of the mine will be increased. The mine produced $125,623.55 in bullion during the fifteen days' run of the Morgan mill from October 15th to October 31st, of which product $76,357.79 was gold. The ore was worked up to an unusually high percentage of its battery assny value.

The following mining companies report having had cash an hand October 31, 1894: Alta, $5057.43; Alpha Con., $2963.13; Andes, $12,061.36; Belcher, $15,387.82; Bodie Con., $67,524.35; Bulwer Con., $3457.59; Best & Belcher, $5701.63; Crown Point, $1326.45; Consolidated California & Virginia, $171,086.20 in cash, and unsold bullion valued at $17,086.95, with further large shipments to be received to close the monthly account; Church, $14,614.72; Chollar, $12,722.35; Con. New York, $2518.22; Challenge Con., $351.97; Con. Imperial, $1810.93; Exchequer, $3714.76; Gould & Curry, $10,213.16; Gray Eagle, $14.08; Hale & Norcross, $10,684.91; Lady Wasbington, $129.04; Mexican, $8542.84; Mono, $959.42; Ophir, $15,205.61; Occidental Con., $408.56; Potosi, $14,470.64; Savage, $3109.36; Silver Hill, $1213.32; Sierra Nevada, $15,842.63; Seg. Belcher, $5250.06; Union Con., $6505.10; Utah Con., $1741.61.

The Bodie Consolidated will pay a dividend of $25,000 on the 26th. Tbe Centennial Eureka of Utah paid a dividend of $30,000 at the close of last month. The Harqua Hala Gold Mining Company Limited of Arizona paid a dividend of 6d per share in London on the 30th. The Mercur Gold Mining and Milling Company of Utah paid a dividend of 12½c per share, or $25,000, last month at Salt Lake City. The Alaska-Mexican dividend of 15c per share, or $30,000, will be paid on Monday. This is the first dividend by that mine, and serves to give an additional point of interest to mining on Douglas Island.

Assessments delinquent this month aggregate $37,800. Of this amount $30,800 is for Nevada mines, $6000 for Californian and $1000 for a Mexican mine.

The following illustrates the changes of the week:

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SEPARATOR.—Robert W. Jessup, Los Angeles, assignor of one-half to Fairfax H. Wheelan of Santa Barbara, Cal. No. 528,434. Dated Oct. 30, 1894. Tbis separator is principally intended for the removal of chent and oats from wheat and barley, and also to raise tbe grade of barley by separating the small sboe-peg barley from the larger grains. The device consists of non-moving, downwardly converging opposing walls mounted at an inclination in the direction of their length and forming a continuous discharge opening between their lower portions. One wall extends beyond the lower edge of the other nnd has its edge turned backwardly at an angle, and said projecting wall is adapted to be adjusted toward and from the opposing wall, and also to be adjusted vertically to vary the width of tbe discharge opening. One of the walls is flexible or yielding while the other is immovable.

VENTILATOR CARS.—Harry H. Love, Sacramento, Cal. No. 528,231. Dated Oct. 30, 1894. The object of this invention is to provide a means for ventilating cars, such as are employed for transporting fruit or other perishable products, and is equally applicable to smoking, sleeping and other passenger cars. It consists of a car having a double bottom, a passage or passages tbrough which air is admitted from the exterior into the channels or spaces formed between the two bottoms, openings whereby air is admitted from tbese channels into the interior of the car, a double roof baving corresponding longitudinal channels extending through and open at opposite ends, said passages having hinged covers at the ends adapted to be raised so as to produce funnel-shaped mouths in the direction toward which the car is moving, whereby a current of air is driven through tbese passages, and openings through the ceilings and inner roof with gauze-protecting covers tbrough which a circulation of air is established through the interior of the car. In addition to this, the sides and ends are also made double, with longitudinal and transverse passages respectively, so that there will always be a circulation of air entirely around as well as through the car.

CONCENTRATOR.—John Norbom, San Francisco, Cal. No. 528,442. Dated Oct. 30, 1894. This invention relates to certain improvements in traveling belt concentrators. It consists of an endless traveling belt moving over drums at the opposite ends of a framework, elastic arms curving in opposite directions, serving as supports for the framework, and means for oscillating the arms so that the framework and belt are moved transversely to their line of travel. These arms are peculiarly curved and attached, so that, in addition to the side movement, a peculiar tilting movement is also given to the traveling table. In conjunction with this is a device for supplying water to a distributing pipe which is supported upon the belt frame and partakes of its oscillating motion. By means of a worm gear and suitable intermediate mechanism power is transmitted from a shaft turning in stationary journals to the movable oscillating parts, so as to transmit motion to the belt. The belt is peculiarly constructed, with tubular flanges upon its edges to prevent the escape of the material over these edges.

LACE, VEILING OR RIBBON HOLDER.—Julius M. Soblesinger, San Francisco, Cal. No. 528,447. Dated Oct. 30, 1894. This invention relates to a holder for the exhibition of lace, veiling or ribbons, and in a construction of bases or supports by which the goods may be properly exbibited. It consists of a flat plate, tubular posts stamped from sheet metal having funnel-shaped ends, plates projecting from the sides formed in a single piece, witb the posts adapted to receive the ends of the bolder plate, a central socket piece passing tbrough one of the posts at right augles extending centrally into the holder plate, and a corresponding socket with polygonal opening adapted to fit a revoluble spindle with correspondingly shaped end whereby the holder may be rotated to wind the material upon it. In conjunction with tbis, I employ sprigactuated locking pins for holding the spindles in proper position.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from E. P. Hagar & Samuel Peeck in the E. S. Grant Mine, near Blue Tent, Nevada Co., Cal., to impound tailings behind brush dam in ravine below the mine; from John Black in the Spanish John Mine, near Rough & Ready, Nevada Co., Cal., to impound tailings behind brush dams in blind ravines and pit; from the Good Hope Mining Co., in the Richmond Hill Mine, near La Porte, Plumas Co., Cal., to impound tailings behind log and crib dam in Onion Valley Creek; from Leonard Dormody in the Martelle Mine, near Salmon Falls, El Dorado Co., Cal., to impound tailings behind dams in Martelle Creek; from J. M. Read & N. E. Beckwith in the Pine Grove and Hidden Treasure Mines, near Pine Grove, Amador Co., Cal., to impound tailings behind brush dams in Saw Mill Gulch and behind log and rock dam in Grass Valley Creek; and from the Gold Run Ditch & Mining Co., in the Gold Run Mine, near Dutch Flat, Placer Co., Cal., to impound tailings behind a rock filled dry masonry dam, 100 feet high, in the North Fork of the American River, about 2 miles above its junction with the Middle Fork, gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Nov. 26, 1894, at 1:30 P. M.

Notice of Assessment.

GARNER CONSOLIDATED GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Mokelumne Hill Mining District, Calaveras county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of October, 1894, an assessment, No. 1, of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 56, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of December, 1894, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 27th day of December, 1894, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Directors.

J. STADTFELD, JR., Secretary.

Office, 309 Montgomery St., Room 56, San Francisco, California.

NOTICE OF ASSESSMENT.—OCCIDENTAL CONsolidated Mining Company; location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey Co., Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the first day of November, 1894, an assessment, No. 17, of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fourth day of December, 1894, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 27th day of December, 1894, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office, room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

ANNUAL MEETING.—THE REGULAR ANNUAL meeting of the stockholders of the Occidental Consolidated Mining Company will be held at the office of the company, room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California, on Monday, the 19th day of November, 1894, at the hour of one o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, November 16, 1894, at 3 o'clock P. M.

ALFRED K. DURBROW, Secretary.

MINING, MILLING, PUMPING and HOISTING PLANTS.

The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

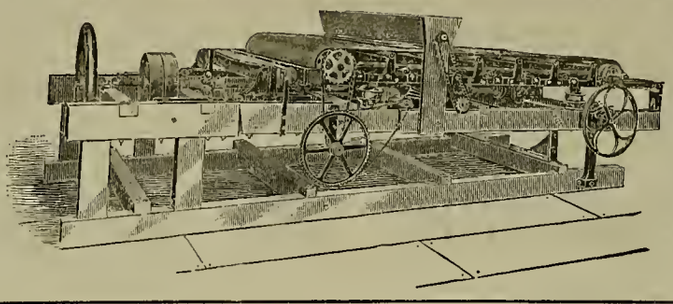
NINETY-FOUR AND ONE-HALF PER CENT —SAVED— ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, Igo, Shasta Co., Cal., May 25th, 1893.
THE McGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

NOTICE TO GOLD MINERS!

C. J. Clark, M. E., Gen'l Supt. Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to to mention. In order to give an idea of the work they are doing here, I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill.
C. J. CLARK, Gen'l Supt.

STRIPPING A LEDGE OR VEIN AND STARTING TO SINK A SHAFT.

How It Looks.

"How does it look?" is a question often asked of a vein or ledge. The accompanying illustration, "taken from life," tells better than columns of description. It is not an ideal sketch, but a picture of the ledge stripped, and the start at sinking a shaft. There are, in this instance, no "dips, spurs, angles or sinuosities," but a very good idea of how a gold-bearing quartz ledge looks can be had from the most casual glauce at the cut. The dip is being ascertained by a clinometer in the hands of a man whose countenance will be recognized by a good many mining men.

To those unacquainted with ledges or veins it may be necessary to say that all ledges are not as square, wide, solid or well defined as the one herewith portrayed. In this regard the ledge outlined is a little better than the ordinary. Ledges vary greatly, from the "razor blade" ledges in the old Manhattan, in Austin, Nevada, to the three-foot ledges of lower grade ore in localities near the State line.

California Asphalt and Bituminous Rock.

The Colorado Western Railway Co., recently organized at Grand Junction, Col., is to build a road from that town through the asphalt region near Vernal and thence to Provo and Park City, Utah. Though the road is as yet only on paper, it was organized mainly to develop the asphalt fields of Utah. These fields are very extensive, but as yet Utah does not produce anywhere near the amount of asphalt that California does. California, Utah and Kentucky produce now all the asphalt and bituminous rock obtained in the United States, and California is by far the largest producer. Had Utah, however, proper transportation facilities, it could make an immense output and have an advautage over this State in comparative nearness to the larger cities of the East for a market.

There are many localities in California where asphalt is known to exist, but where it is not now mined owing to the expense of getting it to market. The abundant resources of this State in asphaltic materials ought to enable it in time to pretty well control the market in these materials, as Michigau and Montana do the copper With the exception of the Kern county fields, which have thus far been rather disappointing in results, the deposits lie mainly in the coast counties, where they have the advantage of both rail and water carriage. Several of the deposits are of remarkable purity and high standard, the output bringing in consequence good prices. The so-called bituminous rock found in Santa

THE State Miners' Convention will be called to order at 10 A. M. on Monday, November 19th, in Metropolitan Hall, on Fifth street, near Market, San Francisco.

INQUIRY regardiug the Yukon river region, Alaska, develops the fact that there are about 1000 people there, couuting miners, missionaries and traders. Wages are $6 a day, and "restaurant board" $12 per week. It is expected that next year the cost of carrying over the summit will be redneed from $15 to $5 per 100 pounds, and the time from Junean to Forty Mile Post shortened to ten days.

The Petroleum Interests.

The petroleum industry of California is one which is growing in importanee yearly. Already we stand about No. 5 in point of production as compared with other States. Petroleum lands stand on the eategory of placers in the eyes of the law, and are subject to the same conditions as to amount which can be located, etc. The provisions of the Stewart mining bill work the same hardships on this industry that they do upou drift mines. No company will nudertake to develop a petroleum claim until it has secured a large extent of territory, because of the expense required in the purchase of the adeqnate outfit to produce, refine and market petroleum in immense quantities. Appliances for sinkiug wells, pipe lines, cars for transportation, tankage and an elaborate bnsiness organizatiou must all be provided.

The probable ontput of a single forty-acre tract will seldom justify this expenditure, and limiting them to that area will prevent future companies from entering the indnstry on a large scale. It is necessary to perform annual assessment work on each forty-acre subdivisiou, with a total separate expenditure of $500 before a patent may be obtained. Very often, even on a large tract, it is desirable to confine the expenditure to one place. It is very difficult now to obtain patent to petroleum gronnd on aceonnt of the absnrd rnlings of the Land Office Department. Petrolenm must actually be produced in paying quantities, and it is not enough to show seepage or the ordinary indications which an operator recognizes.

The petroleum men are therefore just as much interested as the gold miner in bringing about the desired changes in present laws. They should join hands with the State Miners' Associatiou and add their influence to obtain relief from Congress.

A History of the Miners' Movement.

For many years the great gravel mines of California which were worked by the hydraulic process poured forth a flood of gold into the channels of commerce, adding millions to the wealth of the State and nation and sustaining many thriving communities throughout the mountain regions. At the same time, however, they poured forth a flood of debris or tailings into the channels of the rivers, more or less injuring the navigable streams and lands adjacent to the banks.

This resulted in the anti-debris agitation and long-continued litigation in the State and Federal courts. The farmers of the valleys vigorously opposed the miners of the mountains before the people and before the courts, and in the end won their fight. With a decisiou in a noted test case in their favor they were able to obtaiu injunctions upon mine after mine, until finally, with few exceptions, every hydraulic mine tailing into the streams of the drainage basins of the Sacramento and San Joaquin rivers was forced to cease active operations. This state of affairs continued for many years. The press and the general public, fearing the destruction of the navigable streams and bays of the State, aided the anti-debris leaders in their efforts to suppress hydraulic mining, and the miners found themselves in the minority. The decisions of the courts were unfavorable to the continuance of hydraulic mining under the conditions then prevailing, and these decisions appeared to meet with popular approval.

Gradually, as mine after mine was closed down, the men were discharged and these miners found their occupation gone. Quartz mining was not in those days as important a branch of gold mining in California as it has since become, and but few of the discharged men could find employment in their vocation. Great distress resulted in the communities in the mining regions. The smaller camps and towns became practically depopulated, and even the larger places in the regions affected by this cessation of mining were made to suffer.

Men long in comfortable circumstances found themselves without a dollar and unable to earn one in the only business they understood. The decisions against the miners amounted to a practical confiscation of their property, since, being unable to work them, the mines were without value. It was shown during the trials that upward of $100,000,000 had been invested in the hydraulic mines, ditches and works, yet not one cent could be realized from this. The mines could not be either worked or sold. Long and costly litigation had impoverished the miners who were now left penniless to begin life anew.

This condition of affairs not only affected the miners, but the merchants, tradespeople, mechanics and all the thousands who were associated with them. Real property throughout the mining region became practically valueless. People were moving away, there was no business, and houses and lots in the towns were not wanted.

This state of affairs continued for ten or twelve years, and though spasmodic attempts were made to work some mines, hydraulic mining was a dead industry in California. The first signs of a revival were seen when Governor H. H. Markham, in his inaugural address in 1891, called the attention of the Legislature of California to this neglected and oppressed industry, and suggested that the subject be thoroughly agitated, Congress be memorialized, and our Senators and Representatives urged to take all necessary steps to bring the subject properly before Congress at the earliest moment possible. He thought that the subject of the production of gold should be investigated by the Federal Government, just the same as that of irrigation was. He believed that if a proper effort was made, some solution of the problem could be found, and the people be benefited by the gold which would result from a resumption of operations of these mines. This suggestion of the new Governor came in the nature of a surprise to the miners as it was the first favorable word they had heard for years, from one with official influence, and this gentleman, moreover, had been elected, not from a mining, but from a farming community.

A committee of Senators and Assemblymen waited on the Governor and thanked him for his action. During the session of the Legislature, in accordance with the Governor's suggestions, a joint resolution was passed asking Congress to appoint a Commission to come to California to examine our rivers and hydraulic mines and take such action as would enable the hydraulic mines to resume operations.

In the meantime the Commission appointed by the Act of Congress in 1888 filed its report with the Secretary of War. This was the report of Lieut. Col. A. Benyaurd and Major Hanbury and Major Heuer, from which we have frequently quoted. It recommended the construction of impounding dams for the debris, and gave many encouraging facts for the miners, which led them to believe there was a probability of the hydraulic mines being again started after all.

Shortly after the publication of this report of the engineers, in the latter part of 1891, Thomas B. Everett, a working miner of Auburn, Placer county, suggested to Mr. Filcher of the Placer *Herald* the feasibility of calling a convention of the miners of that county to see if they could not take steps to have the hydraulic mines resume work. A call was issued and a number of miners responded. The subject was thoroughly discussed and an address issued to the people of California, setting forth the condition of the hydraulic mining industry and asking for assistance and relief. A call was also issued for a State Convention of miners, to be held in San Francisco, so as to obtain the assistance of all the mining counties.

It so happened that the editor of the MINING AND SCIENTIFIC PRESS was the only representative from San Francisco at the Placer county convention, and to him was therefore intrusted the preliminary work of interesting San Francisco people in the matter. On his return to this city the assistance of others was asked, and a meeting was called to discuss ways and means for organizing. Notwithstanding the fact that many had been asked to attend, there were only sixteen persons present at that meeting at the Mining Bureau rooms. Few thought much could be done, and many were lukewarm. Those who met, however, appointed committees to arrange for the State Mining Convention, and the subject was agitated in the local press. Many people then became interested, and it was soon evident that there had been a change of feeling with regard to the whole subject of mining debris.

In January, 1892, the State Mining Convention was held, and representatives from all the counties of the State were present. It was the most fully attended convention ever held in this city, and great enthusiasm was manifested. The attendance was not confined to miners alone, but representatives from the farming counties were invited to attend and assist in the deliberations. There was a somewhat unexpected reconciliation brought about between the mountain and valley representatives. The miners expressed themselves as willing to abide by the laws and to impound their debris in the future, on understanding which the valley men present were willing to withdraw opposition, it being agreed that Congress was to settle the question between the two factions. A memorial and resolutions were adopted and forwarded to Congress, asking relief on the basis of the report of the U. S. engineers.

A State Miners' Association was then organized, and branch associations formed in the different counties interested. The miners' appeal to Congress was backed up by suitable resolutions of the San Francisco City and County Supervisors, Chamber of Commerce, Board of Trade, and similar organizations, those of Alameda county, and the supervisors of the mining counties. The public press spoke favorably of the resumption of hydraulic mining and sympathy for the miners' cause was everywhere apparent and has since continued.

It is worthy of note that the greatest financial backing received by the miners has been from the merchants, manufacturers and business men of San Francisco. The San Francisco Board of Trade alone gave from its treasury fully four times as much money as the largest hydraulic mining company in the State. The business men of the metropolis recognize the fact that good times in the mining regions will increase their trade in all branches.

There was a long and expensive struggle before Congress to get the necessary laws. The Caminetti bill while pending was made the subject of heated

discussion, and it was evident that old prejudices had not entirely disappeared and that there were still fanaties on both sides of the controversy. The bill, after having suffered many amendments, was, however, finally passed, but in such a shape as to be somewhat unsatisfactory to the two contending factions. Then the State Legislature, which had previously passed a resolution asking Congress to pass the bill, enacted a State law in accord with the Congressional law. The organization of the State Association brought the miners of California into a closer relationship than had ever before existed since the discovery of gold in California. As a result, public attention was directed to the needs and condition of the mining industry in this State and the serious loss to commerce through the limitations that had been unfortunately placed upon the production of gold.

Our State Legislature, when its last session adjourned, left upon our statute-books two laws by which the State not only recognized the legitimacy of the business of hydraulic mining, but pledged financial aid to the extent of a quarter of a million of dollars to aid in its rehabilitation, conditioned only upon an appropriation of at least as much by the General Government In the meantime came the famous Gilbert decision in the North Bloomfield case, which, in substance, laid down the rule that hydraulic mining might be carried on when no material injury resulted therefrom, and further recognized the efficacy of artificial works for the restraining and impounding of mining debris.

This in brief is a history of the movement which finally resulted in the enactment of the Caminetti and the Ford laws. It took earnest and constant work on the part of the Executive Committee of the California Miners' Association to carry out the plans of the convention, but the efforts of those interested were finally successful. As a result, there are about fifty hydraulic mines now legally operating in the region formerly affected by the debris question, and twenty-five or thirty more have their applications for license pending.

As is generally known, the essential features of the new Federal law are that the miners, in order to work claims by the hydraulic process, must provide impounding works in which to store the debris so as to prevent it passing into the navigable streams or their tributaries. The whole matter of operating these mines is placed in the hands of the California Debris Commission, who alone have the right to issue licenses to mine by the hydraulic process in the drainage basin of the Sacramento and San Joaquin rivers. They prescribe the character of the impounding reservoirs and have the right to revoke a license if in their opinion the mine does any damage to the streams. Under these conditions the output of the mines working is limited by the capacity of the settling reservoirs, and the mines cannot be as productive or profitable as when the debris took care of itself and there was no limit to the quantity of gravel which could be washed. At the same time hydraulic mines can now be legally worked in these drainage basins, whereas, before the passage of the Caminetti law, they were all closed down by injunction.

The second conveution of the miners took place in October, 1893. The principal matter before it was the Stewart mining bill, then and now pending before Congress. The objectionable features of the bill were pointed out, and several desirable amendments suggested. It was also the sense of the convention that a new section should be added to the Federal mining laws as follows:

That the officers of the land department of the Government, in construing the provisions of the law relative to the acquisition of the title of the Government to its mineral lands by its citizens, shall construe and apply the same with great liberality, with a view to aid the applicant in procuring said titles, and that the rules and regulations prescribed by said department for its government and that of its officers in disposing of said lands shall be so formulated and administered as to assist the Government in disposing of said lands to bona fide applicants, and not so as to impede said sales or impose onerous burdens on applicants.

A committee was also appointed to draft a mining bill as a substitute for the Stewart bill, which should be more in accordance with the ideas expressed by the miners in their conventiou. This work was done, and resulted in the so-called Newlauds mining bill, which has been introduced in Congress. Both this and the Stewart bill are published in full in this number of the PRESS.

The only action of the convention in regard to hydraulic mining was that the exact sum ($1,030,000) recommended by the Government engineers for impounding works was asked for; and an amendment to the Caminetti Act was further suggested, providing that hydraulic mining may be undertaken with no impounding works whatever, if it appears to the Debris Commission that no material injury to others will result.

In addition to these things Congress was asked to make liberal appropriations for the improvement of the navigable streams of California. It was resolved, moreover, that a display of the mineral products of California should be made at the Midwinter Fair by the California Miners' Association.

Congress has not yet passed either the Stewart or Newlands bill, so that these measures will doubtless be the main subjects of discussion at the convention next week. In fact, the principal work before the miners is in relation to the Federal mining laws.

The miners of this State are now thoroughly organized and in a better position than ever before to obtain recognition before Congress and the Legislature. The people of the State have been made to see the importance of the mining industry and are favorably inclined toward it. The old factional opposition only exists in a slight degree, and the people of California are desirous of assisting the miners in every way.

San Francisco County Miners' Association.

A meeting of the Miners' Association of the City and County of San Francisco, the local branch of the State Miners' Association, was held in the Chamber of Commerce rooms on Monday, with Mr. Geo. W. Grayson in the chair.

On motion of Mr. Sonntag a committee of five was appointed to report in fifteen minutes a list of names as delegates to the State convention. This committee consisted of Julian Sonntag, Ed. H. Benjamin, W. C. Ralston, A. G. Myers and Chas. G. Yale. Upon their report the following delegates to represent San Francisco county in the convention were selected:

Judge Niles Searls, E. A. Belcher, J. Sonntag, C. W. Cross, W. C. Ralston, Thomas R. Church, S. K. Thornton, Charles G. Yale, Andrew Carrigan, John T. Dare, A. J. Ralston, E. H. Benjamin, W. W. Montague, James Spiers Jr., John Bermingham, A. H. Ricketts, Ross E. Browne, Henry Pichoir, G. W. Grayson, Thomas J. Barbour, S. J. Hendy, B. T. Lacy, Joseph Selby, Edward Coleman, John Coleman, J. J. Crawford, F. W. Moebus, John Scott, G. A. Dow, Claude T. Hamilton, Frank J. Fletter, B. B. Thayer, W. F. Hasson, A. J. Rudgear, A. Hayward, James Cross, S. B. Christy, W. S. Edwards, William Irelan Jr., John Ballard and J. B. Treadwell.

The committee were empowered to substitute other names for those who were unable to attend.

Mr. Yale and Mr. Ralston addressed the meeting, urging an attendance of all the delegates, and explaining the objects desired to be accomplished by the convention.

It was resolved to appoint a committee to revise the constitution and by-laws of the State Association, and bring the proposed changes before the Executive Committee. The committee consists of the president, vice-president and secretary of the San Francisco association. Mr. Dunham being absent, Mr. Sonntag was appointed in his place on the committee.

The following officers were elected for the ensuing year: President, Geo. W. Grayson; vice-presidents, A. J. Ralston, S. J. Hendy, B. F. Dunham, E. A. Belcher and Thos. R. Church; secretary, Charles G. Yale.

Officers of California Mining Associations.

The California Miners' Association is composed of members of mining associations in the different mining counties of the State. The officers of the State associations and secretaries of the county associations are as follows:

California Miners' Association.

President.....Hon. J. H. Neff
Vice-President.....S. K. Thornton
Treasurer.....J. Sonntag
Secretary.....W. C. Ralston

EXECUTIVE COMMITTEE.

Hon. J. H. Neff, Placer Co., Chairman.

At Large.—Chas. G. Yale, C. W. Cross, Henry Pichoir, S. J. Hendy, S. B. Christy, R. McMurray, Edward Coleman, E. A. Belcher, A. J. Ralston, B. F. Dunham, W. W. Montague, A. S. Hallidie, John Bermingham, Thos. R. Church and Tirey L. Ford.

Alameda Co.—Felix Chappellet, J. T. Bradley.
Amador Co.—E. C. Voorhies, J. F. Parks.
Butte Co.—Frank McLaughlin, A. Eckman.
Calaveras Co.—S. Foorman, E. Taylor.
El Dorado Co.—G. W. Cummings, J. J. Crawford.
Nevada Co.—J. S. McBride, A. Tregidgo.
Placer Co.—J. E. Doolittle, Chas. F. Hoffmann.
Plumas Co.—W. N. Goodman, W. W. Kellogg.
San Francisco Co.—John C. Coleman, S. K. Thornton.
Shasta Co.—J. E. Lyon, A. B. Paul.
Sierra Co.—Dan T. Cole, Frank R. Wehe.
Siskiyou Co.—R. H. Campbell, Andrew G. Myers.
Trinity Co.—John McMurray, O. M. Loveridge.
Yuba Co.—W. B. Meek, Jas. O'Brien.
Committee on Legislation.—Tirey L. Ford, E. A. Belcher, Chas. G. Yale.
Committee on Finance.—S. K. Thornton, W. W. Montague, B. F. Dunham, S. J. Hendy, Edward Coleman.
Auditing Committee.—W. W. Montague, B. F. Dunham, Dan T. Cole.

MINERS' ASSOCIATION OF THE CITY AND COUNTY OF SAN FRANCISCO.

President.....G. W. Grayson.
Vice Presidents....A. J. Ralston, S. J. Hendy, B. F. Dunham, E. A. Belcher, Thos. R. Church.
Secretary.....Charles G. Yale.

SECRETARIES OF THE DIFFERENT COUNTY ASSOCIATIONS.

J. McMurray, Weaverville.....Trinity
A. J. Meroux, Downieville.....Sierra
A. B. Call, Amador City.....Amador
G. A. Richardson, Placerville.....El Dorado
C. R. Thompson, Spanish Ranch.....Plumas
C. B. Rutherford, City Wharfingers' Office, Oakland.Alameda
Clay Hampton, Bridgeport.....Mono
C. Runckel, Colfax.....Placer
Joseph Durfee, Smartsville.....Yuba
J. J. Rolfe, Assistant Secretary, Nevada City.....Nevada
H. V. Reardon, Oroville.....Butte
Ira Hill Reed, San Andreas.....Calaveras
Louis Heller, Fort Jones.....Siskiyou
C. C. Busb, Redding.....Shasta
Chas. G. Yale, U. S. Branch Mint, S. F.....San Francisco

Desirable Mining Law Changes.

The vital changes in the present mining laws proposed to be made by the Newlands bill, elsewhere printed, have all been duly considered by the special committee of the California Miners' Association. They include several provisions to be found in the Stewart bill, but omit all that have been declared undesirable by the Miners' Convention of last year. Several provisions which the Stewart bill proposes to omit are restored by this bill. It may be, however, that, on consideration; the Miners' Convention of next week will decide to abandon the effort to pass the so-called Newlands bill and endeavor to graft its provisions upon the Stewart bill in the shape of amendments, in the House. The latter bill has already passed the Senate, and it might be easier to amend it than to obtain recognition for an entirely new measure.

In the Newlands bill, as at present drawn, it is proposed to define in a clearer manner the method of making locations of mining claims, that paragraph in the Revised Statutes being made to read as follows, the words in italic being inserted in the new bill:

The location must be distinctly marked on the ground *by posts or monuments*, so that its boundaries can be readily traced.

The following modification as to the period in which assessment work shall be done, is made:

"That the period within which the work required to be done annually on mineral claims shall commence at 12 o'clock *meridian* on the first day of January succeeding the date of location of such claim. When the labor required by this act shall have been performed or the improvements made, an affidavit may be filed within thirty days after the time limited for performing such labor or making such improvements with the Recorder of Deeds of the county in which the claim or mine is situated, particularly describing the labor performed and improvements made, and the value thereof, which affidavit shall be prima facie evidence of the facts therein stated. And upon a failure to comply with the conditions of this act in the performance of labor or making of improvements, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made."

This paragraph is all new matter.

A succeeding provision is altered to read as follows, the words "a patent" being replaced by the words in italics:

On all claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made during each year for each one hundred feet in length along the vein, until *payment of the purchase money and a certificate of entry* has been issued therefor; but where such claims are held in common such expenditure may be made upon any one claim.

This is in accordance with the express recommendation of the State Miners' Association. The following new provision is added in cases of notice upon co-owners who fail to contribute their share of expenditure for assessment work:

A copy of such notice, together with an affidavit showing personal service or publication, as the case may be, of such notice, when filed and recorded with the Recorder of Deeds of the county in which such mining claim is situated, shall be evidence of the acquisition of title of such co-owners.

Section 2334 of the Revised Statutes is amended by adding thereto the following:

And the surveyors appointed under the provisions of this section shall have power to administer oaths to their assistants.

Section 2335 is amended by the following:

SEC. 2335. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths *within the State or Territory where the claim may be situated, having an official seal.*

The present law requires that such affidavits shall be verified within the land district where the claim is situated. The provision, recommended by the Miners' Association, that the presence of rock in place bearing gold, silver, etc., shall be regarded as presumptive evidence that the land is, and always has been, mineral in character, is inserted; together with the provision defining how land shall be determined to be more valuable for mineral than agricultural purposes, and providing that this chapter shall be liberally construed by the Laud Departmeut.

Section 2337, relating to mill sites on non-mineral lands, provides that such lands used or occupied, or *intended to be used or occupied*, may be embraced in an application for a patent, or may be made in a *separate* application for a patent. Locations of such character may reach a maximum of *ten* acres instead of five, as at preseut.

THE Chamber of Commerce will be represented at the Miners' Convention by Geo. W. McNear, A. J. Ralston and Robert Watt. The San Francisco Stock and Exchange Board will be represented by M. J. McDonald, Geo. T. Marye Jr. and Geo. Ives. The Board of Trade will be represented by A. A. Watkins, A. J. Folger and Alonzo Scott.

THE Executive Committee of the California Miners Association has held several meetings within the past two weeks, on business mainly relating to details of the coming convention.

California Asphalt and Bituminous Rock.

(*Continued from page 305.*)

Cruz, Monterey, San Luis Obispo and Santa Barbara counties is coming into constantly increasing use as a paving material. We receive in San Francisco now from 40,000 to 60,000 tons of tbis material a year. The output is only limited by the demand, there being immense beds in the counties named. This substance is rapidly taking the place of hasalt blocks as a paving material in the cities of the coast, and when properly laid is quite satisfactory. It is uot as good as the true asphalt, but that is more expensive in first cost. To sbow tbe valuc of tbese interests to California, it may be stated that tbe value of tbe asphalt and bituminous rock produced in the State last year was upward of $350,000.

Gravel Mining in Missoula Co., Montana.

The Butte *Miner* correspondent has frequeutly referred to the change which bas beeu going on for the past tbree or four ycars in the metbods of mining the large deposits of auriferous gravel in portions of Missoula county.

The old-time plan of sboveling into rockers or sluice hoxes is being superseded hy more scientific work on a larger scale than heretofore. It is evident that this is the only salvation for tbe placer mining industry of this section. The rich and shallow diggings have been worked out, and there is very little ground left that can he worked by old-fasbioned methods and made to pay fair wages to the miner. If the primitive manner of placer mining were adbered to tbe annual yield of placer gold from western Montana would soon sink into insignificance. It is true that in the various portions of the county there are a uumber of placer miners working in the heds of the gulches drifting, and some of them are said to be makiug good wages, hut the yield from this source is small and does uot in the aggregate cut much of a figure in the total amouut of the gold product of tbc country.

The placer-mining yield of this district must, in the future, depend ou the working of the large beds of gravel in the gulches, and which requirc the investment of capital and the application of scientific appliances aud large heads of water. Long bedrock flumes, ditches, giant hydraulics and large derricks for baudliug rock are beyond tbe means of the ordinary iudividual placer miner. These things require capital, lahor and time to put them in operation. The La Cass brothers, who inaugurated this system in Cedar Creek, in the western portion of Missoula county, have heen remarkahly successful, but it required much hard labor, and several years of it, to place their property in tbe condition which it is in to-day—tbat of a bigbly profitable placer mine. The effect of their success bas been to eucourage investmeuts iu other enterprises of a sinilar nature. Oue of these is tbe opening of California gulcb, a tributary of Cedar, by means of a large bedrock flume aud hydraulic. The California Gulch placer mine is owned and operated hy Messrs. Wolf, Blaisdell and Foster. Rohert Foster, one of the owners, is an old-timer, and is well known all over the Pacific coast.

This is the first season tbat this compauy has been ahle to cleau any bedrock, but the results bave been highly satisfactory and demonstrated that the owners have a comfortable fortune in the property. There are six to seven feet of gravel at the bedrock, which yields from fifteen to twenty cents to the pan. This season's work has just fairly opened up the ground, yet it has yielded a handsome profit. They will be able uext season to handle their ground much more rapidly and economically. An English company is negotiating for the property, and it is reported that they have taken it. The figures are understood to be $50,000. The same company is negotiating with Bassett aud La Cass brothers for the Cedar Creek claims, the price to bc paid being $100,000.

A Salt Lake company operating near the mouth of Quartz creek has two large bedrock flumes and two giant hydraulics. They have haudled a large amount of gravel this season, but as it is a close corporation, nothing has been learned as to tbe amount of gold obtained. There are several other enterprises of a similar uature in the gold belt west of Missoula, but most of them have not reached a point in development that could he expected to yield large results. There are a number of gulches in the western part of the couuty that coutaiu from twenty to seventy-five feet of gravel over bedrock, and which offer promisiug fields for tbe investment of capital. Shallow portions of the gulches have paid well in the early days, but tbe ground remaining, to be profitably worked, requires the adoption of methods by which large amounts of ground can be washed economically. When a system of this descriptiou is generally introduced, it is certain that Missoula county can yield for many years to come large sums of placer gold.

What Electricity Is.

Ahout the best auswer we bave seen to this oft asked question appears in the current number of the *Science Review*. As a matter of analogy, tbe author modestly contrihutes to tbe stock of knowledge on this suhject in this wise:

"Do you suppose we will ever know what electricity is?" As I bave been asked tbat question more frequently than any other since I hecame an electrician, I will try to clear the electrical atmosphere a little, and endeavor to bring this apparently mysterious agent down to the level of those forces witb which we consider ourselves on more familiar terms, and in this attempt the reader is presumed to have only a common school knowledge of matters scientific.

Before considering, however, tbe immediate question what electricity is, it will be well to ascertain first what we really know ahout other natural forces, such as gravitatiou or heat, both of which we observe in daily operation with a sort of contempt that is born of familiarity.

What, theu, is gravitation?

After a little reflection, we are compelled to admit that it is quite beyoud our powers to define clearly wbat gravitation is. We can only say at hest that a terrestrial force affects all material hodies in accordance with certain fixed principles called the laws of gravitation, and on askiug some professor of science the question, he replies: "Gravitation is a manifestation of energy, and its laws are so and so."

Let us try again. "What is heat?"

Heat, we say, is a mode of motion, hut we at onee coucede that this definition is ratber unsatisfactory, aud does uot give us a clear idea what heat is. We know, however, that heat affects different material substances differently. The same degree of heat, for instance, melts one substance and freezes another, and we make daily use of this kuowledge.

Going again to the professor of science, he replies as before, that "Heat is a manifestation of energy, and the laws of its action are so and so." We note that his answer is the same to both questious, so he has made at least one significant idea plaiu, which is this: Both heat and gravitation are manifestations of energy, and so far at least arc one and the same thing. The only important thing, after all, seems to be a kuowledge of the laws that explain the action of these forces when at work, for this alone makes them subservient to our needs.

Every form of force, tberefore, should be regarded as a different method or way in which the same thing, morc properly spoken of as energy, makes itself known to the senses.

Of energy itself we can have no intrinsic knowledge, because it is intangihle and invisible; and electricity is no more mysterious in this respect than heat or gravitation. It is fortunately placed witbin our power to learn by study and experiment the laws that control the action of any force, and it is, indeed, a great thing to say, even in tbis uineteentb century, that the laws defining the behavior of electricity, though of comparatively recent date, are as clearly formulated and as thoroughly understood as are those concerning heat or any known force.

The expression, "Energy in the form of heat, energy in the form of electricity," etc., is a trifle clumsy, but very conducive to clear reasoning, and leads us to the cousideration of an important law of nature, which, thoroughly grasped, will bring the auswer to our question, "What is electricity?" clearly into view.

This law is known as the principle of the conservatiou of energy, and teacbes that energy or force, like matter, is indestructible. Thus, for illustration, a smith beats a nail with a hammer—raising the hammer against the gravity force, he brings it down with considerable power. He is not only doing work, but he seems to be expending or actually destroying energy, for to the superficial observer a certain amount seems to disappear at every blow, but the principle we are now discussing tells us this cannot be the case. It tells us that force cannot be got rid of, it only seems to disappear by changing form, always appearing somewhere else in a new guise or dress. Thus, as the nail is hammered, we soon become aware of a new form of euergy that has appeared upon the scene without any appareut reason or excuse for its presence. In fact, tbe uail has become hot, and the question arises, Where did this new energy in the form of heat come from?

We now know that the heat apparently born of the action of hammering is the mechanical energy expended by the smith appearing in a new form; it is the same identical energy that was delivered to the nail by the blows of the hammer, and precisely the same amount. That is the conservation of energy.

Having the law clearly iu mind, we are prepared to attack the main question, "What is electricity?" for the law says that all force is one, though its guise or form of manifestation may be undergoing ceaseless change.

Take an illustration that comes a little nearer to our subject. Nothing at first appears so mysterious as the attraction a magnet exerts upon a piece of iron or steel, but this is only because we are not aceustomed to deal with this form of attraction, and on reflection we are forced to the conclusion that maguetic attraction is uo more to be wondered at tban the attraction of gravitation; both are phenomena of nature, and hoth are equally calculated to excite surprise at first view.

Whenever a force of attraction holds two bodies together, or tends to do so, we use some other force, generally in the form of heat, to separate them. Thus a heavy body rests upon the earth, held there by gravity; to lift it we use mechanical energy. In some way, however, this mechanical force always comes from heat, as when a steam engine is made to do the work; or if muscular power he used, as that of a man or a horse, the power is still traceable to the same source, for in this case also the force exerted originates iu the heat energy of the food, made available for use hy combustion in the body, which is furnace, hoiler and engine all in onc machine, and wbich enables us to exert the muscular power derived from the heat energy of food in a useful way.

If, on the other hand, gravity attraction is free to work hy causing a weight to fall from a height, theu whenever the falling body is either arrested entirely in its course, or its motion is merely cbecked by a resistance, the gravity force at work passes to the heat form.

These transformations between mecbanical energy and heat are quite generally understood. Tbey are merely dwelt upon here because of tbe close parallel that follows when we apply tbe principle of the conservation of energy to cases less familiar.

Return now to tbe magnet which holds a piece of iron so firmly that it requires considerahle foree to tear it away; and suppose power he applied to remove it! Wbat hecomes of the mechanical energy thus exerted? It seems to have passed entirely out of existence, and it will require the closest scrutiny to follow the elusive changes of force that take place in this simple act of separating the iron from the magnet. We may he sure, however, that thc force has heen neither lost nor destroyed, and we must look for its appearance somewhere in the system in which the mechanical force was expended.

Continue for some time to rapidly apply the piece of iron to the magnet, and as quickly pull it away again. It will in time hecome warm, and eventually hot, as a result of this process, aud so will the magnet also, though in a less degree.

Here then is force, that was origiually exerted in the mechanical form, as push and pull to overcome the attraction of the magnet, appearing as heat in thc piece of iron, and it looks very much as if we had simply convertcd mcchanical euergy into heat, as before explained. Energy, however, is often very elusive in passing from oue form to anotber, and closer investigation in this case will show that the change from the mecbanical to tbe beat form involved another step wbich escaped our notice, simply because the intermediate form of force was not evident to the senses. Thus our senses, too completely relied upon, are apt to cheat us sometimes. The truth of the matter is tbat tbe mechanical action of pulliug the piece of iron away from the magnet and putting it hack, set up electric currents in the mass of the iron, which, though not apparent to the eye or the sense of toucb, could he deteeted hy a compass; and these currents flowing hack aud forth in the irou beated it, because every conducting suhstance, however good a conductor of electricity it may be, opposes some resistance to the flow of electricity tbrough its mass; and if the electricity is forced through it against this resistance, the eonductor will bc heated as a cousequence. We see, therefore, that two transformations took place in the iron instead of one.

Mechanical force applied to remove tbe iron from the magnet was first changed to the electric form of energy, existing as electric currents in the iron, but discoverable only with a compass or other suitable instrument, and not evident to the senses. The iron, however, opposing a resistance to the flow of the electric currents in its mass, altered the energy again to the heat form, when it became again evident to the senses; but in passiug through these different stages, it was always one and the same energy, different conditions aud resistances having twice quickly altered its form or mode of manifestation.

It is importaut here to note how resistance of one kiud or another is always the ageut that acts to alter energy from oue form to another. The attraction of the magnet (magnetism) opposed a resistance (mechanical) to the iron being pulled away; hut this resistance was overcome, and the original forces were altered instantly by the resistance to the electric form, existing momentarily as electric currents in the iron. Tbe iron opposed, however, an inhereut resistance to the flow of electric currents through its mass, hut they must flow hecause the irou was forcibly pulled away in the first place—the fact which started all these changes going and which must come to a logical end. The resistauce the iron opposed to electric flow was therefore overcome, but as a direct result the force at work (electricity) has again changed form, and now appears as heat, in which form it is radiated and dissipated into surrounding space.

It would, therefore, appear that electricity, as we

have here observed it, is simply a form or manifestation that the one force better spoken of as an energy may assume under given conditions, and generally, as in the case cited, it is a more transitory stage between the mechanical form and the heat form.

In most operations mechanical force passes to the heat form without passing through the electric form, but whenever magnetism is brought into play as a resistance that must be overcome, then mechanical power applied to overcome this resistance always becomes electricity, if only momentarily in its passage from the mechanical to the heat form.

Can we now answer in a fairly satisfactory way the question, "What is electricity?" by saying that it is simply a form that energy may assume while undergoing transformation from the mechanical or the chemical form to the heat form or the reverse?

In this attempt at a definition I have purposely referred to energy in the chemical form, not heretofore referred to, as it is not apparent from the illustration given where the electric current of a battery comes from, and how, in this case, it is also traceable to a mere transformation of energy.

There are, fortunately, many ways of obtaining energy in the electric form; but in nearly every case, if not quite all, it will exist as a transitory state of energy in its passage from some other form to the heat form. Thus, in the case of a battery, we start with energy in the chemical form, by which we mean the affinity or strong tendency that an acid has to unite with a metal to form a new combination, this chemical energy or affinity being a potential force of nature, like gravitation or magnetism.

As long as the circuit of the battery is closed, or, in other words, as long as a path is afforded for the electric current to flow, the chemical change will go on. When the path is broken or interrupted in any way, the chemical change will practically cease, because no transformation to heat through the electric form can now take place. While, however, the path is closed, chemical change is going on, an electric current is flowing through the wire path, the wire becomes heated, and there is dissipation of heat by radiation from the wire, in direct proportion to the amount of chemical energy expanded; but the energy, before appearing as heat, has been momentarily in the electric form, and can be discovered by placing a compass under the wire path, which is made hot by the invisible and intangible electric current.

Thus the definition derived from our simpler illustration holds also true in this case, and the conservation of energy, rigidly applied, will thus make the existence of force in any form clear to the eye of the mind.

ELECTRIC COAL DRILL.

Electric Coal Drill.

A small portable electric drill, for use in both anthracite and bituminous mines, has been recently brought out by the General Electric Company. The drill is similar to the well-known Howells drill with an electric motor geared to it in such a way as to form a light and efficient tool.

The control of the motor is effected by a small plug switch. No rheostat being used, power may be taken from the same wire supplying current for lighting, pumping or haulage.

Feed screws of different pitch are furnished for varying the speed of boring and a friction clutch protects the motor should any particularly hard obstacles be struck suddenly.

The columns are made in different lengths and each is adjustable for about two feet variation. The construction of the drill and its method of mounting enable the operator to drill close to the roof, floors or walls as well as in any direction.

Valuation of Foreign Coins for Customs.

The practice of fixing a value of foreign coins for appraisement purposes, says the *Bulletin*, has been in operation for twenty years. It was first established by an act of Congress March 3, 1873, entitled "An act to establish the custom house value of the sovereign or pound sterling of Great Britain, and fix the par of exchange." The law made it the duty of the Director of the Mint to fix such values and proclaim them on the 1st January each year. The first publication was made January 1, 1874, and thereafter annually until October 1, 1890, when the law was amended so as to require these publications to be made quarterly.

The necessity for this change grew out of the rapid fluctuations in the price of silver and its downward tendency. The first publication under the new law was made October 1, 1890, and they have since been made every three months. The values of the silver coins of the different countries are fixed on the average price of fine silver for the previous three months, computed on the number of grains and fineness of the coins. The object is to ascertain, as nearly as possible, the gold value of these coins for the purpose of fixing uniform values of foreign goods entered into the United States for appraisement purposes so as to insure an equitable rating of such values under the existing tariff.

Parties who import goods from sections where Chile money is used do not understand why appraisements of values should be made on the basis of 91.2 to the peso, or dollar, instead of the market value of such coins in this country, which for some time past has been from fifty cents to fifty-two cents. If these coins are bought here at those rates and used in the purchase of goods from countries or sections using Chile money as currency, it is difficult to see why goods for which 1000 of these coins have been paid at a cost of $500 to the importer should be valued at $912 for the purpose of fixing the duty on the same. When the duties are ad valorem, it makes a large difference whether the Chilean peso is valued at 91.2, as fixed by the Director of the Mint, or 50, as fixed by commercial usage.

It is noted that the Director of the Mint does not pursue the same policy as to the value of the monetary unit in all countries. This is true of several countries. For example, the franc of Belgium, France and Switzerland is 19.3, just as it has been right along for several years. There has been no change in the value of the mark of Germany, the drachma of Greece, the lira of Italy, the pseta of Spain, or the peso of the Argentine Republic, Chile and Cuba. All these are silver coins, and all these countries are on the gold and silver or bimetallic basis. That, indeed, may be the reason why these silver coins have not been reduced in value. Of course, if these countries use both gold and silver interchangeably, redeeming their silver in gold whenever called upon to do so, the case is altogether different from silver-using countries. We presume that is the explanation of the matter in some cases.

It is not true, however, of the peso of Chile. This coin corresponds to the silver dollar. Its commercial value outside of Chile is no greater than the commercial value of the Peruvian sole or the Mexican dollar. Its gold value in Chile is slightly under the gold value of the other coins named in their respective countries. Chile does not redeem its pesos in gold. The Mint Director's valuation of this coin has been 91.2 cents for several years. Such valuation for appraisement purposes is evidently wrong. It should be put on the same footing as the Peruvian sole and the Mexican dollar.

It is interesting to observe in this connection the great restriction in the value of silver coins of silver-using countries, as fixed by the Director of the Mint on October 1, 1890, the first date under the law requiring quarterly publications and the 1st October, 1894. The comparison is as follows:

	October—	
	1890.	1894.
Boliviano of Bolivia	$0 69.4	$0 46.4
Peso of Central American States	69.8	46.4
Shanghai Tael of China	1 03.1	68.5
Haikwan Tael of China	1 14.8	76.3
Peso of Colombia	69.8	46.4
Sucre of Ecuador	69.8	46.4
Rupee of India	32.2	22.7
Yen of Japan	75.2	50.0
Dollar of Mexico	75.8	50.0
Sol of Peru	69.8	46.4
Ruble of Russia	55.8	37.1
Mahbub of Tripoli	62.9	41.8

The average decline in the value of these coins is about 33⅓ per cent.

The Bartlett Process.

The new mill of the Bartlett Process Reduction and Mining Company, which is being built at Gillett, in Beaver Park, Colo., is expected to solve the problem of treating successfully the low-grade ores of Cripple Creek district. The company's prospectus says: "The ore is ground by means of heavy hollow rollers in which cannon balls revolve. The roller revolves in a circular steel pan, there being a series of rollers and pans, and the rock, in passing from pan to pan, is ground to a powder far finer than that obtained by any other system of stamps or rolls. The most minute particles of free gold are by this means separated from the rock. The powder is treated by means of chemicals, which amalgamate the free gold and take into solution a small quantity of combined gold. Under the ordinary method of treatment, large quantities of gold are lost from rusted or greased surfaces or from a combination with gangue matter. These conditions prevent the gold from adhering to the mercury-covered plates, but in the Bartlett process this is entirely obviated.

"The doctor worked for three months testing ores from the Ida May, Buena Vista, Elkton, Portland, Ingham, C. O. D., Raven and Anacouda. The percentage of gold saved was from 70 to 89 per cent, the highest being from $11.20 ore from the Summit, and the lowest from $20.40 ore from the Anacouda.

"The treatment of free-milling ore will cost 55 cents a ton. The charges made will be $3, and from 70 per cent of the assay value up will be paid to the owners. The Bartlett process will pay the mine owner $4 net on $10 ore, and the delivery of the ore to the mill will be at an additional cost of from 60 cents to $1 per ton. As the mill will work 100 tons of ore a day the profit of the process over any mill will be readily appreciated. More refractory ores will require roasting, but the percentage of saving will be greater. The charges on this treatment will be $4 per ton.

"An important feature of the mill will be complete rotary roasters, which will have a capacity for handling 100 tons a day. This can be done at a cost of about 75 cents per ton, and will add largely to the saving of gold that otherwise will pass off in the form of tellurides, or combined with the sulphides of iron."

Gold From Smoke.

The Omaha and Grant Smelting Works are putting a new device at their smelters in Omaha and Denver to recover the minerals that now pass away in smoke and fumes. It is not generally known that the smoke from such plants is laden with metals of value notably, gold, silver and lead, but such is the fact. It has been the constant study of metallurgists for years past to devise some practical and economical method that would condense this material. The new device is briefly described as follows:

A horizontal flue some 1,500 feet in length, exposing a surface for radiation and condensation of the heated gases of upward of 54,000 square feet. Through this flue are drawn the flumes by means of a fan, outer circumference of which, at full speed, revolves at a velocity of nearly two miles a minute. The flumes now under pressure, are forced into a spacious building, from which there is no means of escape, except through a filter of textile fabric, the colorless gases passing through into a stack beyond, while the valueable soot or smoke condenses on the inner or lower side, from which it is collected from

time to time, compressed into molds and fed back again into the furnaces, where the valuable metals are extracted and separated. It may be of interest to note that there will be 10,000 square yards of filtering material and not one particle of valuable fume can escape.

It is proposed to complete these improvements in the shortest possible time, probably six weeks or two months.—Ex.

The Stewart Bill.

IN THE SENATE OF THE UNITED STATES.

JANUARY 29, 1894.

MR. STEWART introduced the following bill, which was read twice and referred to the Committee on Mines and Mining.

MARCH 20, 1894.

Reported by MR. STEWART with amendments, viz.: Omit the parts in SMALL CAPS and insert the parts printed in *italics*.

JUNE 15, 1894.

Passed the Senate.

A BILL

To amend chapter six of title thirty-two of the Revised Statutes, relating to mineral lands and mining resources.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section twenty-three hundred and twenty-four of the Revised Statutes be amended so as to read:

"SEC. 2324. The miners of each mining district may make regulations, not in conflict with the laws of the United States or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground by posts or monuments, so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located as will identify the claim. On each lode claim located after the tenth day of May, eighteen hundred and seventy-two, and until payment of the purchase money and a certificate of entry has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year. On all lode claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made during each year for each one hundred feet in length along the vein until payment of the purchase money and a certificate of entry has been issued therefor; and for each twenty acres of placer claims, and for each subdivision thereof less than twenty acres, TEN *fifty* dollars' worth of labor shall be performed or improvements made during each year until payment of the purchase money and a certificate of entry shall be issued therefor. But where several adjoining lode claims, not exceeding five, are owned or held by the same person, association or corporation, and the sum of five hundred dollars or more is expended in any one year in good faith for the development of all of the claims so owned or held, not exceeding five, there shall be no requirement for separate labor or improvements to be performed or made on the several claims so owned or held during such year. The year within which the annual labor or improvements required to be performed or made by this section shall commence at twelve o'clock meridian on the first day of October of each year: *Provided*, That upon claims located previous to the first day of March in any year the annual labor or improvements shall be performed or made on such claim for that year prior to twelve o'clock meridiau of the first day of October next succeeding; and upon claims located after the last day of February and prior to twelve o'clock meridian of the first day of October in any year the annual labor or improvements required shall be performed or made within one year from twelve o'clock meridian of the first day of the succeeding October: *And provided further*, That only one-half of the annual labor or improvements required by this act shall be necessary to be performed or made prior to twelve o'clock meridian of the first day of October, in the year eighteen hundred and ninety-five, but after the first day of October, in the year eighteen hundred and ninety-five, the full amount of labor or improvements required by this act sball be performed or made upon such claims as in all other cases during each year prior to twelve o'clock meridian of the first day of October. In case the first day of October falls on Sunday or any holiday the following secular day shall be construed as the first day of October within the meaning of this Act. When the labor required by this Act shall have been performed or the improvements made an affidavit may be filed within thirty days after the time limited for performing such labor or making such improvements with the recorder of deeds of the county in which the claim or mine is situated, particularly describing the labor performed and improvements made, and the value thereof, which affidavit shall be prima facie evidence of the facts therein stated. And upon a failure to comply with the conditions of this Act in the performance of labor or making of improvements, the claim or mine upon which such failure occurred shall be opeu to relocation in the same manner as if uo location of the same had ever been made: *Provided*, That the original locators, their heirs, assigns, or legal representatives, do not resume work upon the claim after such failure and before such relocation, and coutinue the same with reasonable diligence until the required amount of labor shall have been performed or improvemeuts made; but no relocation of a claim by a person who has already located such claim and failed to comply with the conditions of this Act in performing work or making improvements shall be valid prior to such resumptiou and continuaunce of work upon such claim. Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing or notice by publication in the newspaper published nearest the claim, for at least ouce a week for ninety days, and if at the expiration of ninety days after such notice in writing or by publication such delinqueut shall fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditures. A copy of such notice, together with an affidavit showing personal service or publication, as the case may be, of such notice, when filed and recorded with the recorder of deeds of the county in which such mining claim is situated, shall be evidence of the acquisition of title of such co-owners. Where a person or company has or may run a tunnel for the purpose and with the intent in good faith of developing a lode or lodes owned by said persou or company, the money so expended in runniug said tunnel shall he taken and considered as expended ou said lode or lodes: *Provided further*, That said lode claim or claims shall be distinctly marked on the surface, as provided in this Act."

SEC. 2. That section twenty-three hundred and twenty-five of the Revised Statutes he so amended as to read:

"SEC. 2325. A patent for any land claimed and located for valuable deposits may be obtained in the following manner: Any person, association, or corporation authorized to locate a claim under this chapter, having claimed and located a piece of land for such purpose, who has, or have, complied with the terms of this chapter, may file in the proper land office an application for a patent, under oath, showiug such compliance, together with a plat and field notes of the claim or claims in common, made by or under the direction of the United States surveyor-general, showing accurately the boundaries of the claim or claims, which shall be distinctly marked by monuments on the ground, and shall post a copy of such plat, together with a notice of such applicatiou for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least one person that such plat and notice have been duly posted, and shall also file a copy of the notice in such land office, and shall thereupon be entitled to a patent for the land in the manner following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made, for the period of sixty days, in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant at the time of filing this application, or at any time thereafter within the sixty days of publication, shall file with the register a certificate of the United States surveyor-general that five hundred dollars' worth of labor has been expended or improvements made upon the claim by himself or grantors; that the plat is correct, with such further description by such reference to natural objects or permanent monuments as shall identify the claim, and furnish an accurate description, to be incorporated in the patent. At the expiration of the sixty days of publication the claimant shall file his affidavit, showing that the plat and notice have been posted in a conspicuous place on the claim during such period of publication. If no adverse claim shall have been filed with the register and receiver of the proper land office at the expiration of the sixty days' publication, it shall be assumed that the applicaut is entitled to a patent, and that no adverse claim exists, and upon the payment to the proper officer of five dollars per acre he shall receive a certificate of entry; and thereafter no objection from third parties to the issuance of a patent shall be heard except it be shown that the applicant has failed to comply with the terms of this chapter. But no more than three thousand feet in length along the vein on claims located prior to the tenth day of May, eighteen hundred and seventy-two, and not more than the extent of fifteen hundred feet in length by six hundred feet in width located after said date shall be included in the same application for a patent, and not more than forty acres of placer or petroleum ground shall be included in the same application for a patent: *Provided*, That when fractional claims are located or sought to be patented between other existing claims the end lines may be made to conform to the lines of such adjoining claims."

SEC. 3. That section twenty-three hundred and thirty-four of the Revised Statutes be amended by adding thereto the following:

"And the surveyors appointed under the provisions of this section shall have power to administer oatbs to their assistants."

SEC. 4. That section twenty-three hundred and thirty-five of the Revised Statutes be amended so as to read:

"SEC. 2335. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths in any State or Territory of the United States or in the District of Columbia having an official seal, and all testimony and proofs may be taken before any such officer, and when duly certified by the officer taking the same, attested by his seal of office, shall have the same force and effect as if taken before the register and receiver of the Land Office. In cases of contest as to the mineral or agricultural character of land the testimony and proofs may be taken, under such regulations and notice as the Commissioner of the General Land Office may prescribe: *Provided*, That the presence of rock in place bearing gold, silver, cinnabar, petroleum or other valuable mineral shall be regarded as prima facie evidence that the land containing the same is mineral in character: *And provided further*, That in investigating the character of land with a view to ascertain whether it is more valuable for mineral OR *than* agriculture, evidence may be taken of the mineral discovered or developed adjacent to such land."

SEC. 5. That section twenty-three hundred and thirty-seven of the Revised Statutes be amended so as to read:

"SEC. 2337. Where nonmineral land not included in a lode claim is used or occupied, or is intended in good faith to be used or occupied by the proprietor of such vein or lode claim for mining or milling purposes, such uonmineral surface ground may be embraced and included in an application for a patent for su h vein or lode claim, and the same may be patented therewith or separately, subject to the same preliminary requirements as to survey and notice as are applicable to veiu or lode claims; but no location hereafter made of such nonmineral land shall exceed ten acres, and payment for the same must be made at the same rate as fixed by this chapter for the superficies of the lode claim. The owner of a quartz mill or reduction works, not owning a mine in connection therewith, may also receive a patent for his mill site, as provided in this section."

SEC. 6. Amend section twenty-three hundred and thirty-eight of the Revised Statutes so as to read:

"SEC. 2338. As a condition of sale each patent shall reserve the right of way through or over any mining claims for roads, ditches, canals, cuts, tunnels, and other easements, for the purpose of working mines and for agricultural purposes: *Provided*, That any damages occasioned thereby shall be assessed and paid in the manner provided by the laws of the State or Territory in which such mine is situated for assessments and payments for land taken for public use under the right of eminent domain. And the rights and easements heretofore reserved under the provisions of this section (twenty-three hundred and thirty-eight of the Revised Statutes) in patents heretofore issued shall be regulated and made available as herein prescribed."

SEC. 7. That town-site entries may be made by iucorporated towns and cities on the mineral lands of the United States, but no title shall be acquired by such towns or cities to any vein of gold, silver, cinnabar, copper, or lead, or to any valid mining claim or possession held under existing law. When mineral veins are possessed within the limits of an incorporated town or city, and such possession is recognized by local authority or by the laws of the United States, the title to town lots shall be subject to such recognized possession and the necessary use thereof, and when entry has been made or patent issued for such town sites to such incorporated town or city, the possessor of such mineral vein may enter and receive patent for such mineral vein and surface grouud recognized hy the local laws and statutes of the United States not held or possessed adversely to the claimant for such miueral vein by other than the said city or town, or when it shall appear that the claimant otherwise entitled to such mineral vein has acquired title to such surface ground from the said city or town: *Provided*, That no entry shall he made hy such mineral-vein claimant for surface grouud where the owner or occupier of the surface grouud shall have had possession of the same before the inception of the title of the mineral-vein applicant.

SHASTA reports that the Distlehorst Bros. are making "barrels" of money with their dredger, which is now working the river bed opposite Middle Creek station. They work night and day, and are getting valuable returns.

Copy of Bill Introduced in Congress by Hon. Francis G. Newlands of Nevada.

Introduced February 17, 1894, and referred to Committee on Mines and Mining.

The bill proposes to amend Sections 2324, 2334, 2335 and 2337 of the Revised Statutes of the United States by striking out the portions in *italics* and inserting the portions in SMALL CAPS.

A BILL

To amend chapter six, of title thirty-two, of the Revised Statutes relating to Mineral Lands and Mining Resources.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled:

SECTION I. That section twenty-three hundred and twenty-four or the Revised Statutes be amended so as to read:

"SEC. 2324. The miners of each mining district may make regulations not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground BY POSTS OR MONUMENTS so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim. On each claim located after the tenth day of May, eighteen hundred and seventy-two, and until *a patent* PAYMENT OF THE PURCHASE MONEY AND A CERTIFICATE OF ENTRY has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year. On all claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made *by the tenth day of June, eighteen hundred and seventy-four and* DURING each year *thereafter* for each one hundred feet in length along the vein until *a patent* PAYMENT OF THE PURCHASE MONEY AND A CERTIFICATE OF ENTRY has been issued therefor; but where such claims are held in common, such expenditure may be made upon any one claim; *Provided that the period within which the work required to be done annually on all unpatented mineral claims shall commence on the first day of January succeeding the date of the location of such claim, and this section shall apply to all claims located since the tenth day of May, anno domini, eighteen hundred and seventy-two.* THAT THE PERIOD WITHIN WHICH THE WORK REQUIRED TO BE DONE ANNUALLY ON MINERAL CLAIMS SHALL COMMENCE AT TWELVE O'CLOCK, MERIDIAN, ON THE FIRST DAY OF JANUARY SUCCEEDING THE DATE OF LOCATION OF SUCH CLAIM. WHEN THE LABOR REQUIRED BY THIS ACT SHALL HAVE BEEN PERFORMED, OR THE IMPROVEMENTS MADE, AN AFFIDAVIT MAY BE FILED WITHIN THIRTY DAYS AFTER THE TIME LIMITED FOR THE PERFORMANCE OF SUCH LABOR, OR MAKING SUCH IMPROVEMENTS, WITH THE RECORDER OF DEEDS OF THE COUNTY IN WHICH THE CLAIM OR MINE IS SITUATED, PARTICULARLY DESCRIBING THE LABOR PERFORMED AND THE IMPROVEMENTS MADE, AND THE VALUE THEREOF, WHICH AFFIDAVIT SHALL BE PRIMA FACIE EVIDENCE OF THE FACTS THEREIN STATED; and upon a failure to comply with *these conditions*, THE CONDITIONS OF THIS ACT IN THE PERFORMANCE OF LABOR OR THE MAKING OF IMPROVEMENTS, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made: Provided, that the original locators, their heirs, assigns or legal representatives, *have not resumed*, DO NOT RESUME work upon the claim after SUCH failure and before such RE-location AND CONTINUE THE SAME WITH REASONABLE DILIGENCE UNTIL THE REQUIRED AMOUNT OF LABOR SHALL HAVE BEEN PERFORMED OR IMPROVEMENTS MADE.

"Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing, or notice by publication in the newspaper published nearest the claim for at least once a week for ninety days; and if at the expiration of ninety days after such notice in writing, or by publication, such delinquent shall fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditure. A COPY OF SUCH NOTICE, TOGETHER WITH AN AFFIDAVIT SHOWING PERSONAL SERVICE OR PUBLICATION, AS THE CASE MAY BE, OF SUCH NOTICE WHEN FILED AND RECORDED WITH THE RECORDER OF DEEDS OF THE COUNTY IN WHICH SUCH MINING CLAIM IS SITUATED, SHALL BE EVIDENCE OF THE ACQUISITION OF TITLE OF SUCH CO-OWNERS.

"Where a person or company has or may run a tunnel for the purpose of developing a *lode or lodes*, CLAIM OR CLAIMS owned by said person or company, the money so expended in RUNNING said tunnel shall be taken and considered as expended on said *lode or lodes, whether located prior to or since the passage of said act; and such person or company shall not be required to perform work on the surface of said lode or lodes in order to hold the same as required by said act*, CLAIM OR CLAIMS: PROVIDED FURTHER, THAT SAID CLAIM OR CLAIMS SHALL BE DISTINCTLY MARKED ON THE SURFACE AS PROVIDED IN THIS ACT."

SEC. 2. That section twenty-three hundred and thirty-four of the Revised Statutes be amended by adding thereto the following:

"AND THE SURVEYORS APPOINTED UNDER THE PROVISIONS OF THIS SECTION SHALL HAVE POWER TO ADMINISTER OATHS TO THEIR ASSISTANTS."

SEC. 3. That section twenty-three hundred and thirty-five of the Revised Statutes be amended so as to read:

"SEC. 2335. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths *within the land district* IN THE STATE OR TERRITORY where the claims may be situated, HAVING AN OFFICIAL SEAL, and all testimony and proofs may be takeu before any such officer, and, when duly certified by the officer taking the same, ATTESTED BY HIS SEAL OF OFFICE, shall have the same force and effect as if taken before the register and receiver of the land office.

"In cases of contest as to the mineral or agricultural character of land, the testimony and proofs may he taken as herein provided, on personal notice of at least ten days to the opposing party; or, if such party cannot be found, then by publication for at least once a week for thirty days in a newspaper to be designated by the register of the land office as published nearest to the location of such land; and the register shall require proof that such notice has been given: PROVIDED, THAT THE PRESENCE OF ROCK IN PLACE BEARING GOLD, SILVER, CINNABAR, PETROLEUM, OR OTHER VALUABLE MINERAL, SHALL BE REGARDED AS PRESUMPTIVE EVIDENCE THAT THE LAND CONTAINING THE SAME IS, AND ALWAYS HAS BEEN, MINERAL IN CHARACTER: AND PROVIDED FURTHER, THAT IN INVESTIGATING THE CHARACTER OF LAND WITH A VIEW TO ASCERTAIN WHETHER IT IS MORE VALUABLE FOR MINERAL THAN AGRICULTURAL, EVIDENCE MAY BE TAKEN OF THE MINERAL DISCOVERED OR DEVELOPED ADJACENT TO SUCH LAND, PROOF OF WHICH SHALL BE PRESUMPTIVE EVIDENCE THAT THE LAND IN QUESTION IS, AND ALWAYS HAS BEEN, MINERAL IN CHARACTER: AND PROVIDED FURTHER: THAT WHEREVER LAND IS PROVEN TO BE WITHIN A WELL-DEFINED MINERAL BELT SUCH LAND SHALL BE DEEMED, PRESUMED AND TAKEN TO BE, AND ALWAYS TO HAVE BEEN, MINERAL LAND, UNLESS THE CONTRARY IS PROVEN: AND PROVIDED FURTHER, THAT THE PROVISIONS OF THIS CHAPTER SHALL

BE LIBERALLY CONSTRUED WITH A VIEW TO AID THE APPLICANT IN PROCURING TITLE TO THE MINERAL LANDS OF THE UNITED STATES, AND THAT THE RULES AND REGULATIONS PRESCRIBED BY THE LAND DEPARTMENT FOR ITS GOVERNMENT AND THAT OF ITS OFFICERS, IN DISPOSING OF SAID LANDS, SHALL BE SO FORMULATED AND ADMINISTERED AS TO ASSIST THE GOVERNMENT IN DISPOSING OF SAID LANDS TO BONA FIDE APPLICANTS, AND NOT SO AS TO IMPEDE THE SALE THEREOF, OR IMPOSE ONEROUS BURDENS UPON APPLICANTS."

SEC. 4. That section twenty-three hundred and thirty-seven of the Revised Statutes be amended so as to read:

"SEC. 2337. Where non-mineral land, not *contiguous to the vein or lode* INCLUDED IN A LODE CLAIM, is used or occupied, OR IS INTENDED TO BE USED OR OCCUPIED by the proprietor of such vein or lode CLAIM for mining or milling purposes, such *non-adjacent* NON-MINERAL surface ground may be embraced and included in an application for a patent for such vein or lode CLAIM, and the same may be patented therewith, OR SEPARATELY, subject to the same preliminary requirements as to survey and notice as are applicable to *veins or lodes*, VEIN OR LODE CLAIMS; but no location hereafter made of such *non-adjacent* NON-MINERAL land shall exceed *five* TEN acres, and payment for the same must be made at the same rate as fixed by this chapter for the superfices of the lode CLAIM. The owner of a quartz mill or reduction works, not owning a mine, in connection therewith, may also receive a patent for his mill-site as provided in this chapter."

Personal.

CHIEF ENGINEER PETERSON of the W. Y. O. D. mine, Grass Valley, has resigned his position.

MR. BOSQUI succeeds C. W. Merrill in charge of the Bodie Standard Co.'s cyanide plant.

THOS. W. BUZZO succeeds W. E. Hall as superintendent of the Alice G. & S. M. Co., at Walkerville, Utah.

JOHN W. YOUNG, who formerly represented Fraser & Chalmers at Helena and Spokane, is now general western agent of the company, with headquarters at Salt Lake City.

PETER APPLEGATE has recently been appointed Government Mineral Surveyor for southern Oregon. His work will be that of surveying and examining all mining property in this part of the State for which a patent is asked from the Government.

Obituary.

ERNEST HUHN, superintendent of the Eagle Bird or Oak Tree mine, at Mayhert, Nevada Co., Cal., met a terrible death on the 8th inst., falling down the shaft a distance of 600 feet while superintending the rebuilding of the hoisting works. He was a well-known mining man, a graduate of Freiberg, at one time a member of the firm of Huhn & Luckhardt here, and intimately connected with various mining projects of considerable magnitude. Mr. Huhn was in the fifty-sixth year of his age.

IT has been decided to continue the Ontario (Utah) drain tunnel from the No. 2 shaft to a point underneath No. 3, and operations will be commenced at once. Whether the tunnel will be continued to the Daly or not is a question that will be decided after the present objective point is reached.

Concentrates.

BUTTE, Montana, is the largest mining camp on earth.

IT is proposed to establish a provincial mining bureau in Vancouver, Wash.

AT Greaterville, Arizona, 150 men are placering for gold, most of them Mexicans.

A SIXTY-STAMP mill is being erected at the Little Jessie group, Chaparral, Arizona.

THE Eric mine near Eureka South, Nevada Co., is to be extensively operated this winter.

ANOTHER dividend has been declared by the Morning Star Mining Company of $3 per share.

THOUGH no new mills are just now being started in Utah, good development work is being done all over the territory.

THE Boston & Montana Copper and Silver Mining Company has declared dividend No. 16 of $1 per share, payable the 27th.

NATIVE quicksilver is reported found at Tuscarora, Nev., assaying from fifteen per cent to as high as thirty-five per cent.

MESSRS. BROWN & HEIMRICH of the Mercur Co., Utah, have been experting a gold property in Siskiyou Co. with a view to investment.

ABOUT forty men are placer mining at Rock creek, South Okanogan, most of whom will stay in all winter. The average is $6 per day.

JOHN J. NEATHAMMER'S placer mines in Saxes Creek district, Oregon, have been sold to Messrs. Johnson and Noland of Seattle for $15,000.

THE Economy Reduction Works at Florence, Col., offer to handle refractory gold ore for $7 per ton. The plant includes both chlorination and cyanide.

THE Badger mine on Pike Flat, Nevada county, is to be bonded to A. Carrigan and other San Francisco merchants for two years, for further development.

MONTREAL MEN have bought the Victoria Hydraulic Co.'s claims on the north and south forks of the Quesnelle, B. C., for $70,000. Ross Brown is now at work on the property.

THE Maud Hydraulic Mining Company has been incorporated by Messrs. J. M. Browning, J. M. Buxton and C. Wilson, of Vancouver, B. C. The capital stock is $25,000.

ABOUT twelve mining claims believed to be in British Columbia have been found to be on the Colville reservation. Over $1000 has been spent in labor and now titles cannot be secured.

THE Tucson, Arizona, *Citizen* says the Old Glory camp is proving to be a great success. The mine and mill are in full operation and giving satisfaction. A few days ago a letter from S. H. Gould, superintendent of the mill, said that the test run had been made and a large amount of gold saved on the plates.

IT is reported in southern Oregon that Neal and another man, who own the Golden Eagle mine on Williams creek, took out a $10,000 bunch of ore one day last week. The mine had been bonded to Ashland men for several months, but they had allowed the bond to lapse after doing much work. The owners had worked but a day or two when they made the strike.

THE mines in that part of the Black Hills around Garden City are coming to the front and prospecting is going on very busily. The rich discoveries in the Katie lode of the South Dakota Mining Company have encouraged lots of depressed prospectors to resume their search for the precious metals known to exist there in large quantities.

SINCE the Morning mine, at Mullan, Idaho, started in on the co-operative plan several more mines in that vicinity are spoken of as probable startors during the month. The eighty-five men employed at the Morning seem to be perfectly satisfied with the new order of things, and many applicants are refused employment, though it was thought at the beginning that not many miners would apply for jobs at the Morning under the co-operative arrangement.

"NON-ASSESSABLE treasury stock" in a Cripple Creek, Col., gold mine is offered at ten cents a share to the publishers of this paper to be swapped for advertising space. The proffer states "we are positive you will make a handsome profit." It may be said without prejudice that it is not customary for owners of stock in a gold mine, who are positive that "a handsome profit" will be realized therefrom, to make such an offer. Though it is declined, the present owners of the stock are to be congratulated on their valuable possession.

IT is calculated that $10,000,000 has been saved to the owners of mining claims by the suspension of the law requiring $100 in labor to be annually spent on unpatented claims. It may be objected that the check to the expenditure of money works damage to districts where the circulating medium is not any too plentiful, but on the whole the suspension of the statute has been of benefit to the prospector. It does not prevent any one who wants to from performing the prescribed amount of work on a claim, and has lightened many a poor miner's load.

AT Midway, B. C., last week was a case before Gold Commissioner Lambly. A man named Haas had staked a claim, but did not record it. A man named Baxter staked it again, but he also did not record it. The plaintiff, Dittmer, and Haas, the defendant, again located claims, overlapping the original, and these were recorded. It was held that Haas' rights were void because he had not obtained permission to record the second time, and Dittmer's location was good. Haas could, however, upon obtaining the required permission, stake the part not taken by Dittmer.

Makes Everybody Tired.

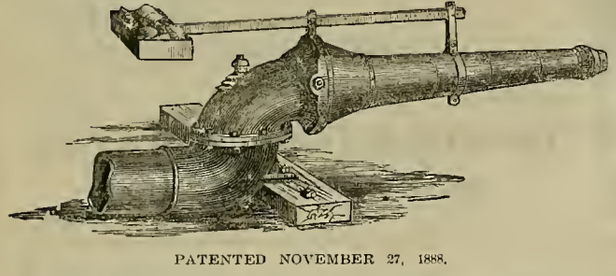
George Ohleyer has again rushed into print, and occupies two columns in the *Appeal* on "The Hydraulic Giant—The Havoc It Causes—Desolation in Valleys," etc., etc. Every time things quiet down between the miners and the farmers Ohleyer gets a long stick and stirs them up again. George, you make everybody tired. Go and take a rest.—Oroville Mercury.

JOSHUA HENDY MACHINE WORKS,

(INCORPORATED SEPTEMBER 20, 1882.)

Main Office and Salesroom, 38 to 44 Fremont St. Foundry and Machine Works, Cor. Bay, Kearny and Francisco Sts.

SAN FRANCISCO, CALIFORNIA.



PATENTED NOVEMBER 27, 1888.

Improved Form Double Jointed Hydraulic Giant.

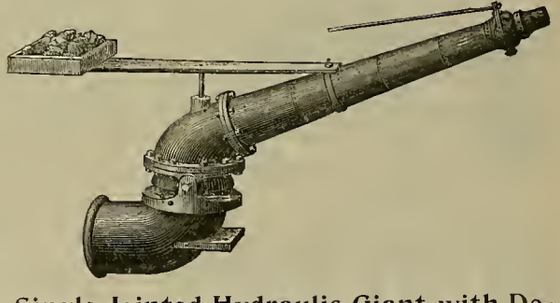
Manufacturers of

QUARTZ MILLING MACHINERY,

HYDRAULIC MINING MACHINERY,

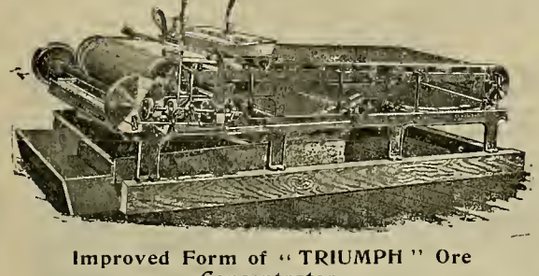
SAW MILLING MACHINERY,

HYDRAULIC GRAVEL ELEVATORS,



Single Jointed Hydraulic Giant with Deflector and Weighting Attachment.

HYDRAULIC GIANTS, SINGLE AND DOUBLE JOINTED IMPROVED FORM.



Improved Form of "TRIUMPH" Ore Concentrator.

WRITE FOR PRICES AND CATALOGUE.

CORRESPONDENCE SOLICITED.

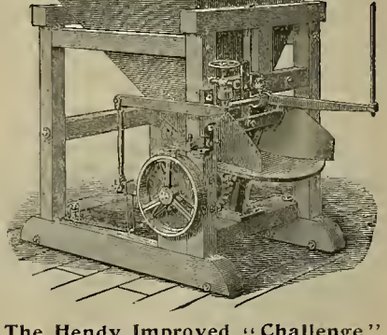
SHEET IRON HYDRAULIC PIPE, ALL SIZES, AND GATE VALVES FOR SAME.

WATER WHEELS.

HENDY IMPROVED CHALLENGE AUTOMATIC ORE FEEDERS.
IMPROVED FORM TRIUMPH ORE CONCENTRATORS.
SHAFTING, BOXES, COLLARS AND PULLEYS.

DEALERS IN BOILERS AND ENGINES.

MINE AND MILL SUPPLIES,
LEATHER AND RUBBER BELTING,
LUBRICATING COMPOUNDS,
NON-SHRINKING PATENT WOODEN TANKS,
REEVES' WOOD SPLIT PULLEYS,
STEAM PUMPS,
GRIFFIN CHILLED CAR WHEELS, ETC., ETC.



The Hendy Improved "Challenge" Ore Feeder.

Scientific Progress.

Acclimatized Rats and Cats.

A new interesting case of the gradual adaptation of animals to their surroundings is quoted in a recent number of *Public Opinion* from the Pittsburg *Dispatch*. It appears that in the cold-storage warehouses in Pittsburg there were originally no rats or mice. The temperature iu the cold rooms was too low. Tbe keepers soon fouud, however, tbat the rat is an animal of remarkable adaptability. After some of these houses had been in operation for a few months, the attendants found that rats were at work in the rooms where the temperature was constantly kept below the freezing point. They were found to be clothed in wonderfully long and thick fur, even their taperiug snake-like tails being covered by a thick growth of bair. Rats whose coats have adapted themselves to the conditions under which they live have domesticated in all the storage warehouses in Pittsburg. The prevalence of rats in these places led to the introductiou of cats. Now, it is well known that pussy is a lover of warmth and and comfort. Cats, too, have a great adaptability to conditions. When cats were turned loose in the cold rooms tbey pined and died because of the excessive cold. One cat was finally introduced into tbe rooms of tbe Pennsylvania Storage Company which was able to witbstand the low temperature. She was a cat of unusually thick fur, and she tbrived and grew fat in quarters wbere the temperature was below thirty degrees. By careful nursing a brood of seven kittens was developed in the warehouse into sturdy, thick-furred cats that love an Icelandic clime. They have been distributed among the other cold-storage houses of Pittsburg, and have created a peculiar breed of cats, adapted to the conditions under which they must exist to find their prey. These cats are short-tailed, chubby pussies, with hair as thick and full of under fur as the wild cats of the Canadian woods. One of the remarkable things about them is the development of their "feelers." These long stiff bairs that protrude from a cat's uose and eyebrows are, in tbe ordinary domestic feline, about three inches long. In the cats cultivated in tbe cold warehouse the feelers grow to a lengtb of five and six inches. This is probably because the light is dim in these places, and all movements must be tbe result of the feeling sense. The storage people say that if one of these furry cats is taken into the open air, particularly during the hot season, it will die in a few hours. It cannot endure a high temperature, and an introduction to a stove would send it into fits.

Small-pox.

The recent outbreak of small-pox in London, though the prompt measures taken seem to have been effectual in confining it within moderate limits, may serve to remind us how difficult a thing it is to fight against an enemy whose exact nature we do not know. Empirically, we have learned much as to the prophylaxis and treatment of the disease, and now that experiment has demonstrated that vaccinia is merely small-pox modified by transmissiou through the cow, we have a rational scientific basis for the practice of vaccination. Yet, though small-pox is always with us, and in spite of the fact that experimental inoculation of mankind with its attenuated virus is rendered compulsory by law, the actual nature of the virus remains still under dispute. It is rather the fashion nowadays, when no bacterium can be demonstrated in a given specific disease, to invoke the Protozoon. That Protozoa may cause disease we know—witness malaria—but the utmost caution is required in interpreting the appearances to be seen in epithelial cells stained with fancy dyes, and the protozoan origin of small-pox, as of cancer, rests at present on a very slender foundation. And, indeed, there is now some evidence that the virus of small-pox may after all be a spore-bearing bacillus which bas hitherto eluded observation by its habit of turning into an unstaiuable spore at an earlier period thau tbat at wbich any one had tbougbt of looking for it. Both Dr. Klein and subsequently Dr. S. Monckton Copeman have independently discovered tbat such a spore-bearing bacillus is to be demonstrated in the lesions of small-pox and vaccinia, if search be made at a sufficiently early stage of the disease; and tbougb cultivatious have uniformly failed, there seems at least to be a possibility that this organism may prove to be the true cause of small-pox.—Natural Science.

Measuring Time Intervals.

The measurement of minute intervals of time is one of the most difficult subjects met with in the laboratory, and this is more especially the case as the apparatus employed is often little adapted for the use of those who lack experience in the precisiou gained by years of experimental work in physics. Mons. Tissandier has recently devised a photochronograph, which comprises a metallic disc turning freely on an axis passing througb its center. The free end of a spring carries a needle-point, which bears against the disc; this spriug is timed to give 500 vibrations per second. This rate is determined by timing the spring so that it vibrates between known vibrations of 493 and 522 periods per second. Any want of extreme accuracy in the determination of the intermediate point is not of great importance, as it can be shown that the difference only affects the fifth place of decimals of a single second. Of course any variation in speed of the disc does not influence the number of vibrations of the spring. By means of a magnesium light traces of the path of the spring are left upon a sensitive plate mounted upou the disc. The apparatus is certainly not new in principle in this country, but the arrangement is one which we are not aware has been described in the form given to it by Mons. Tissandier.—Industries and Iron.

Opal Mines Deserted.

The Nampa, Idaho, *Leader* says: Reports from the Owyhee opal fields are anything but encouraging. Not a man left in camp, and the visitor may enter mines and carry away what he finds. What a pity it is indeed that these stones cannot be marketed, for it is an undisputed fact that they surpass anything iu tbe world. The famous Shirley mine, from which the opals that took first prize at the World's Fair were taken, has also been deserted, and although the mountain contains gems enough to supply the world—and of the rarest beauty, too—has not as much as a "keep out" uotice posted up to waru off the inquisitive prospector. Only a short year ago there were probably a hundred men in camp, and many of them possessed a can full of these beautiful stones that would have dazzled the eyes of a native from the great opal fields of Central America, and whicb had a commercial value of from $3 to $35 per karat, yet no buyers could be found, and now these men are working rockers on Snake river, barely making a living. It is to be hoped that there will yet be a demand for Owyhee opals and tbe fondest hopes of those who own tbe claims may be fully realized.

Leadville's Gold Belt.

"It should be remembered," said one of the best known miners of the camp in an interview with the *Herald-Democrat*, "that as yet the gold belt is not the seat of great mineral production. With the exception of the Ibex, the Lillian and the Golden Eagle, tbere are not any important gold-producers. It will take time and mouey for those other shafts to get down to tbe ore bodies, but I am perfectly well satisfied that they will catch these great Breece Hill chutes. By next spring I am under the impression that tbere will be no less tban a dozen large shippers of gold ore from Breece and Printer Boy Hills."

FOR SALE.
Two Mines of Free Milling Gold Ore.
For particulars address JAMES A. SCOTT, Reno, Nevada.

A MINING ENGINEER
Of a large western mining company, with extensive experience in working quartz and placer mines, desires a situation as manager or superintendent in California. Address J. T. C., care of MINING AND SCIENTIFIC PRESS.

MINING
TAUGHT BY MAIL 4500 STUDENTS
DIPLOMAS AWARDED. Courses in other tradee, all including tborougb instruction in Matbematics and Pbysics. Send for FREE Circular, stating subject you wish to study, to **The Correspondence School of Mines, Scranton, Pa.**

The Annual Convention
OF THE
California Miners' Association
WILL BE HELD IN
SAN FRANCISCO,
MONDAY.....November 19th, 1894.

Questions of importance to tbe Quartz, Drift and Hydraulic Mining Industry in California will be considered, and County Mining Associations are requested to appoint delegates at once.

Our Senators and Congressmen are expected to be present at this Convention and the Miners of the State will bave an opportunity of bringing before tbem sucb matters as affect tbe welfare of tbe Mining Industry.

Place of meeting will be publisbed later.

EXECUTIVE COMMITTEE CALIFORNIA MINERS' ASSOCIATION.
By WM. C. RALSTON, Secretary.

BOLTHOFF'S PATENT
Combined Automatic Alarm Bell and Indicator
FOR
HOISTING ENGINES.
SIMPLE,
ACCURATE,
DURABLE,
AND APPLICABLE FOR ANY HOISTER.
ADDRESS.....
Hendrie & Bolthoff M'f'g Co.,
MINING MACHINERY and SUPPLIES,
DENVER.....COLORADO.

PLACER AMALGAMATORS
Combined with Steam Shovel or Dredge.
BUCYRUS SYSTEM.
NEW METHOD OF PLACER MINING.
Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.
Built solely by the
BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
South Milwaukee, Wis., U. S. A.

Adamantine Shoes and Dies
—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates.
These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketcb with exact dimensions. Send for Illustrated Circular.
Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
STAMP SHOES
STAMP DIES
H. D. MORRIS, Agent, 220 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill Supplies.
Stamp Cam.

Mechanical Progress.

The Machinist in the Foundry.

An engineer who devotes his attention mainly to and is especially interested in machines for use in foundries, says the *American Machinist*, was remarking the other day that he knew of a case where an establishment making large numbers of steam-pipe elbows had built a special machine at a cost of about $4000 for tapping these elbows, the saving effected by the machine as compared with their older methods being only a few cents on the hundred elbows; yet it was all they expected, and was enough to warrant the expense of the machine.

The manager of the same establishment was shown, conclusively, that by the adoption of a certain molding machine for making these same elbows the cost of their production could be reduced, as compared with his present methods, considerably more than fifty per cent. The machine was not ordered, and our friend looks upon this as a typical illustration of the peculiar difficulties which lie in the path of the man who attempts to do missionary work in the foundry. Here was a concern willing to make close figures on the possible saving by the use of a machine to be set up and used in their machine shop, and to be guided by the results shown by the figures, even though the margin was very small; yet when the same concern came to consider a machine of much greater economic potentiality for their foundry, figures showing a very large margin failed to impress them sufficiently to influence their decision in favor of the machine.

This and many other similar instances are probably due mainly to the fact that successful manufacturers have been educated up to the point of taking ever possible advantage, and introducing every possible improvement in machine shop and kindred operations, while in the foundry they have so long been accustomed to letting things go in the old way that the mere introduction and use of an improved machine or method that, were it in the machine shop, would be taken as a matter of course, is here looked upon as revolutionary, and, in fact, so much of a departure from the beaten path as to make it seem like a leap in the dark.

No douht the fact that improved machines which are to he used in machine shops will he under the care of, if not operated by, machinists skilled in such matters and interested in their success, while in the foundry it is usually different, undouhtedly has much to do with the matter, and in many instances this feature of the case is of considerahle importance.

Nevertheless, uothing seems more eertain than that the foundry work is to he greatly improved within the next few years, and in no way more than hy the increased use of machinery for doing that large proportion of work which is scarcely more than a repetition of the same cycles of movements and operations from morning until night, and from Monday until Saturday—work which any intelligent man can quickly learn to do, and which no molder, worthy of the name, ought willingly to work at.

It is almost needless to point out that the manufacturer whose foundry work is adapted to it and who admits the machinist and his methods into the foundry first, and hefore it becomes the universal practice, will reap the largest rewards of his enterprise, and if he wants to be fully abreast of the procession he will be very cautious ahout concluding for himself what is and what is not suitahle work to be done upon machines. Rapid advances are heiug made along this line, and unless a foundryman has fully investigated the matter, and is sure ahout it, he had hetter look into it. There are some difficulties in the way, perhaps, but so there are in the way of ahout everything that is at all worth doing, and what is work, after all, hut simply a continual overcoming of difficulties of one sort or another. The machinist has invaded the foundry and will remain there, not to do the work which requires the skilled and highly trained molder—work which requires the exercise of the real art of the molder—hut to do all that large elass of work which is small enough and made in sufficiently large numhers to make it worth while to put in and operate machines.

The Gas Engine.

The probabilities are, says the *Scientific Machinist*, that the next ten years will witness the development and use of gas engines to an extent little dreamed of by the average person. The small steam engine is likely to feel this competition severely in the immediate future. The uses of small power in cities are great and rapidly growing. It was believed hy many a few years ago that the electric motor would be substituted for small gas engines in cities and towns, but that has not been done extensively. The expense of current is greater than the public expected it to be, and the liahility of its being cut off hy reason of break-downs at the power station, which experience has proved to be of no small consideration, has not caused electric power to grow in favor. Perhaps the shutdowns for repairs to the machinery or the line, the latter particularly, as it is exposed to many risks, fire being the most annoying, are not more numerous or otherwise damaging than those which occur in the small independent plant, hut it is a peculiarity of human nature to experience less exasperation with trouhle from a domestic than from an outside source. Another inconvenience of the motor is that it cannot he used even a little after the hour for current to he shut off without nearly douhle the expense. One may require power hut an hour or two during the day, hut with a motor the expense is no less than it would he were it used all day.

Were it not for the city ordinances requiring a licensed operator for every steam engine plant, large or small, the motor would have made even less progress than it has.

Nearly all these ohjections are overcome hy the engine which can he operated with gas from the city retorts or made from gasoline on the spot. It can he used at any time. When not in use it is not an expense. It requires no licensed operator.

Not only does the vapor engine promise to supplant the motor and small engine and hoiler plants for stationary work, hut it is reasonahly certain to hecome a sharp competitor of the former in street railway service in the near future. The trolley system cannot, we believe, hold its present commanding place in railway work many years. It has served and is serving the puhlic satisfactorily, hut it has many serious faults, chief among which is the dependence of the whole line on a single plant. Sooner or later each car must he equipped with an independent power generator. Of all motors capable of use on cars, independently, the gas engine is the hest adapted to the work. It has its faults, and there are a numher of obstacles to he successfully overcome hefore it will come into general use for street-car propulsion, hut the extension of its use in other work and the facility with which engineering difficulties limiting its use have heen surmounted, lead us to helieve that it will soon reach the necessary stage of perfection for railway service to cause it to be extensively employed for that work.

Peculiar Locomotives.

The Baldwin Locomotive Works have just turned out three locomotives for the Erie & Wyoming Valley Railroad, which have some peculiar features. They are moguls, with fifty-six-inch drivers, wide fire-box (not Wooten) and weigh ahout 120,000 pounds. The peculiar features are the three 17x24-inch cylinders, set on an incline, so as to allow the middle one to drive the main axle just inside the right driver, all heing connected at 120°, so as to have a continuous pull, deemed necessary by the master mechanic, Mr. John B. Smith of Dunmore, Penn., on account of the heavy grades on the road. The tank is also peculiar to American roads, and is the same as that adopted hy Daniel Coxe Jr. of the D. S. & S. R. R., heing a six-wheel tank similar to English practice.

Burning Coal Dust.

An apparatus for hurning coal dust has been invented and hrought out in Germany, which appears worthy of more than passing notice. It is stated that the consumption of even the most inferior class of coal-dust is attended with no smoke, while the heat produced is so intense that the apparatus has heen adapted in Berlin to smeltiug works, and with excellent results. The gases as analyzed contain 9.8 per cent carbonic acid, 1 per cent air, 79 2 per cent nitrogen.

Professional Cards.

HEALD'S
Business College,
24 Post Street, - San Francisco
FOR SEVENTY-FIVE DOLLARS
This College instructs in Shorthand, Type-Writing Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. Send for Circular. C. S. HALEY, Sec.

Practical Treatise on Hydraulic Mining.
BY AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, postpaid. For sale by THE HEWEY PUBLISHING CO., 220 Market St., San Francisco.

LIGHTNING LARGEST WELL MACHINERY Works.
All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Butte.

AROUND FORBESTOWN. — *Register*: From County Surveyor McCoy who was at work in the Forbestown region last week we gather the following mining items:

He surveyed two quartz mines for the Beik brothers. These ledges lie east of the placer mine of J. B. Price and his mine lies east of hut adjoins the Stow or Gold Bank mine. While there he surveyed for a new high flume to he erected hy the South Feather Ditch Company as they have to put up a new flume fifty feet or more in height across a canyon. The superintendent of the company is actively at work repairing aud building new flumes and putting the ditches in the best possible order. H. P. Stow is in 125 feet with his big tunnel which is to tap the Gold Bank quartz lode eleven hundred feet below the present works. The tunnel will be twelve hundred feet long and is heing driven with Burleigh drills run by water power. When the ledge is tapped they will then drive up the 1100 feet and thus have an immense body of ore open for work. If all proves satisfactory a huge mill will be built down in the canyon. A new road costing between $4,000 and $5,000 is now being constructed by Mr. Stow from his present mill down to the mouth of the big tunnel.

The Titus, Vail and Finch quartz mine on the north side of the South Fork is looking very well and so is the new ledge discovered by G. W. Price.

About ninety-five men are employed at the Stow mine, mill, tunnel and road, while from fifteen to twenty men are at work in the Shakespeare mine. The lot of rock crushed by the Sheaspeare mill from the Carlisle mine proved rich enough to warrant tbe erection of a mill on the property and it is understood that Mr. Carlisle is now in San Francisco making arrangements about a mill to he built.

The Mt. Hope mill three miles above Frobestown is running. Work on the Phœnix at Hurleton has stopped until spriug. It is said that Russell & Company the owners of the Dutch Ravine mine will huild a five stamp mill.

The Hurleton King owned hy McMillan Brothers is heing opened hy them and promises well.

Nevada.

Transcript: The Banded Treasure mine, situated on the Middle Yuba river, a few miles from North San Juan, is looking fine. A three-foot Huntington mill has just heen put up. The ledge is large; the quartz assays $50 a ton. Being of a decomposed nature, it is easily and quickly crushed hy a rotary mill.

ON THE SAN JUAN RIDGE.—Cor. Nevada *Transcript:* The Enterprise is situated about 800 feet west of the Delhi, six miles from Columhia Hill. Development work is being done at this mine. The St. Gothard mine, which is owned principally hy the Champion Mining Company of this city, is also located here. There is not much doing on this mine at the present time and very few men are employed. The Live Oak miue is located ahout six miles from Columbia Hill on the same side of the river as the Delhi. The tunnel has heen driven a distance of 500 feet and some valuable ore discovered. A. McMahon, Jr., who is the superintendent of the mine, informed us that the prospects of the mine were exceedingly bright. The ledge is eighteen inches thick and has an average value of $10 per ton. While Columhia Hill is not so prosperous as at some periods of her history, the outlook is far from discouraging.

CHEROKEE.—From Columhia Hill we proceeded to Cherokee and found everything quiet, owing to the suppression of hydraulic mining. There are some quartz ledges being developed in the surrounding country, prominent among which is the Quick Bros.' property at Badger Hill. This mine is in a prosperous condition. The ore is of a very high grade. The sulphurets will average $120 a ton. The Superintendent, Paul Quick, Jr., informed us that the vein is fifteen inches thick and every part of it shows free gold. This mine is employing several meu and there is every evidence of its hecoming a permanent droperty.

SAN JUAN.—San Juan is rapidly recovering from the shock received through the suppression of hydraulic mining. The people are confident of the future happiness and prosperity of the town and they hear a cheerful expression. The people are aware of the great injustice which they have suffered through the inhibition of hydraulic mining, hut they bear their grievances with a nohle and heroic patience which must eventually win for them the sympathy and support of every individual who understands their position.

San Juan was once the center of a large and prosperous mining community. On every hand were evidences of activity and success, which must have heen gratifying to every resident. In close proximity to the town is the famous Sebastopol miue, which has heen great in extent and the richness of its gravel. This mine has produced several millions of dollars, and when in full operation gave employment to a large number of men. At the present time several quartz veins are being developed which, if successful, will prove a valuahle adjunct to the town. Prominent among the quartz mines in close proximity to San Juan are the Boss mine, Penetrator and the Crane and Wright. The mines are all located on the same ledge and are yet in a state of development. The Boss mine is owned by Morris and company of San Francisco. They are employing fifteen men and extracting a large amount of ore monthly.

The future of the mine is promising. There is a large vein and the ore is easily extracted. The Crane and Wright is owned by the gentlemen whose names it bears. They have succeeded in developing a fine body of mineral. A tunnel is driven into the hill for eighty feet and a ledge averaging from five to sixty-five is in sight. They already have about five hundred tons of ore extracted, which is valued at $6 per ton. They have five hundred feet of backs ready for stoping. The proprietors informed the writer that a mill could he constructed cheaply and that water power is easy of access. With a fair amount of capital a veritable bonanza could be developed on such a magnificent hody of mineral. The Penetrator is owned hy the Huckins brothers of San Juan. They are operating an extension of the Boss ledge and already have a tunnel forty feet into the hill. They think tbe prospects for developing a productive mine are very favorable. The Boss ledge is an immense deposit of gold quartz. Its correct widtb has not yet been accurately ascertained. But it is safe to assert that in the future it will make San Juan equally as famous as a mining center as it was during the zenith of the hydraulic hoom.

At French Corral we found the condition of things to be more favorahle than for many months past. Situated at this place is the Milton Company's famous mine. The gravel in this mine is exceptionally rich. Some of it has paid as high as eighty-one cents to the inch, and the average yield is 41.5 cents to the cubic yard, which is far ahead in richness of all other Nevada county mines. Hydraulicking is not heing prosecuted on account of the impositions of the Caminetti act. At the present time they are engaged crushing the cement gravel which is found in the bed of the deposit. A twenty-stamp mill is erected on the property and several men are employed. The gravel pays well for erushing. French Corral is rapidly coming to public notice as a fruit producer. Altogether the San Juan ridge is more prosperous than for a number of years past, and with the rehabilitation of hydraulic mining the people anticipate a return of the prosperity so prevalent during the hydraulic era.

Plumas.

HALLSTED MINE.—During the past ten days rumors have heen rife that the sale of the Hallsted, Duncan and other mining properties at Rich Gulch, on the East Branch, has heen effected, and many movements point in that direction. Last week Geo. Gahle, representing the noted mining man, Chas. W. Ertz, came up from Merrimack, went over to Long Valley, near Greenville, and put some men at work on the reservoir site located in the interest of the new company a few weeks ago. It is understood that the water to he stored in this reservoir will be conducted to the Rich Gulch mines referred to. Mr. Gable returned from there and went down to the mines via Spanish Ranch to investigate the question of getting a road down to the river, to arrange for laying in supplies and to choose a site for a sawmill. It is understood that the purchasers will erect this mill at as early a date as possihle.

The facts mentioned and other indications point to the sale of this great quartz property, which is destined to he one of the most gigantic operations inaugurated in the State. If reports are true, next seasou will he one of great activity in that section. The erection of one of the largest quartz mills ever seen on this coast is among the certainties.

We are not in position to state as a certainty that the sale has been made, but we are convinced that such is the fact, and that this great and valuable mining property, in the hands of the purchasers, will inaugurate an era of prosperity in this part of Plumas unknown for years.

Sierra.

Messenger: There are forty stamps running at the Bonanza ledge. The pay chute is thirty feet wide, and the owners claim there is sufficient ore availahle to last for twenty years or more.

The Wilson Bros. struck another pocket in Hungry Mouth ravine last Monday. They took out $164 in a couple of hours.

Tuolumne.

Democrat: The ledge of the Stanley-Kanaka mine, near Jacksonville, is from 75 to 150 feet in width and will average $5 per ton in gold. It is large enough and has gold enough in it to keep 200 stamps running for ten years. A San Francisco company is negotiating for it.

Faxon's mine, the Isabella-Gem-Consolidated, of Jeffersonville, is looked upon as one of the honanza properties of this county. It is the regular continuation of the Rawhide and Rappahannock mines and is ahout to he worked hy an Eastern company. The lode and attendant ground comprise thirty-eight acres, and the lode proper is over 100 feet wide. It shows free gold in many places and will average $7 per ton in free gold and sulphurets.

It is stated in Sonora that the Alabama mine and mill, near Jamestown, has heen sold for the sum of $25,000, and that the new company will soon begin operations. This mine ahout ten years ago was owned and operated hy W. N. Harris of Jamestown and J. Bell of San Francisco. Litigation overcome the enterprise and operations were stopped. The mine is forty feet wide, assays $5 per ton, is a true fissure and has fine hlack slate walls. It has a forty-stamp mill on it, one of the finest in the State.

ARIZONA.

PIMA COUNTY.—ROSEMONT.—A piece of copper from the new furnace was brought in. It is fine-appearing metal, very pure, and softer than the usual run of Arizona copper. The quality will make it superior for wire, and will give it a hetter price than ordinary. At the camp all is life and bustle. Men to the number of thirty or forty are working on roads from the various mines that dot the hills about. Forty or fifty men are employed in the mines, and are constantly developing at a good rate. The mines are all improving on development. The favorite mine of the group is the Chicago, which has a splendid ore hody, and high grade. Another mine desirable in a copper camp is one carrying a good proportion of zinc. This will be valuable as a flux.

GOLD ORE.—*Silver Belt:* R. E. Humphrey completed a very successful run of gold ore on Friday in the Klein mill. Thirty-five tons of ore worked yielded ahout $25 per ton in gold, or a total of $875. In fittiug up the mill, which entailed a considerable expense, Mr. Humphrey introduced several ideas of his own, and he is highly pleased with the result. The ore worked heautifully, coming up to ninety-five per cent of its gold value. Mr. Humphrey is now convinced that he has, in the Great Western mines, a very valuahle property and a paying proposition. The amount of $25 ore available is very large, and the mines will now be worked with redoubled energy.

LYNX CREEK. — Prescott *Courier:* Lynx creek and other creeks in that vicinity were flooded hy the rain. Several cloudbursts occurred on tbe head of Lynx creek within a short space of time.

Quite a number of men are working the bed of Lynx creek this fall, more so than usual. They report that they are about making wages.

Several parties have left this country for the southwestern part of the Territory where dry diggings are said to exist.

The old Howell smelter will be lined with corrugated iron and put in shape to run all winter. Plenty of ore is promised.

COLORADO.

BIG CYANIDE PLANT. — Ground will be broken at Florence next week, says the Denver *Record*, for the largest cyanide plant in existence for the treatment of gold ores, the South African tanks heing exclusively occupied with the treatment of tailings from the stamp mills. Messrs. D. H. Moffat, Eben Smith and Cbarles J. Hughes of Denver are the local directors.

Philip Argall, who recently received United States patents for important improvements in the MaeArthur-Forrest process—so far as the same is applicable to Colorado gold-silver ores—designed the proposed plant. He will go to Florence next week to start the construction. Contracts for the material and machinery have already been let. The new plant will contain six tanks, each with a capacity for 100 tons of crusbed ore. It takes about three days to complete the leaching of a single charge, so the capacity of the Florence works, to begin with, will range from 150 to 200 tons per day. The cost is stated at close to $60,000.

The site selected is on the line of the Florence & Cripple Creek railroad, about a mile and a half from the Rio Grande depot, iu the town of Florence. Ample provision is made for an early enlargement of the works to 300 tons per day.

BRITISH COLUMBIA.

AT CARIBOO.—Mr. Mann, a Montreal contractor, says: "Two miles up the south fork of the Quesnelle are the works of the Carihoo Hydraulic Mining Co. There are located two gold properties said to he the richest ever discovered in America. The share holders are nearly all Montrealers, including Sir William Van Horne, Vice-President Shaughnessy and Mr. Ogden of the C. P. R. The company has only heen organized two years, but is carrying on operations on a gigantic scale. They already employ 250 men, and the works are not completed yet. As an experiment the water was recently turned on for thirty-seven hours, and at the end of that time the sluice hoxes yeilded over $5,000 in gold."

WASHINGTON.

DEVELOPMENT WORK. — Okanogan *Outlook:* Dull as the times have been in the mining districts of this section of the Okanogan mining belt, it is estimated that upward of $50,000 has been expended in development work during the past six months. There is hardly a man in this part of the county who has not had an opportunity to at least provide himself with a winter's "grubstake," and yet we occasionally hear men kicking about hard times. But that is the way of the world.

The stamp mill at Fairview is again in operation after a temporary shutdown, and we are informed that it will continue running indefinitely. The company owning the mill bas placed a new man in charge and proposes to make a most thorough test of the ores of the district with a view of ascertaining their value, and, at the same time, to find out the adaptahility of the machinery for treating the ores. To that end, we are informed, the company has made arrangements with the owners of the leading mines in the camp to treat at least 100 tons of ore from each.

There is quite an excitement in the Hunter creek country, in Stevens county, over recent mineral discoveries. From all reports of the extent and richness of the ore hodies being developed, the Bunker Hill and Sullivan mines in the Cœur d'Alene country are "not in it." From one mine alone 100 tons of ore are being shipped daily to the Tacoma smelter. Robt. Myerhoff, the Coulee City freighter, has the contract for hauling the ore from the mine to the railroad, a distance of ahout fifteen miles. Jas. Monaghan of Spokane is one of a company which has recently honded and is now operating this mine. It is stated that the company paid $2500 down and is to have three years to pay the halance of the purchase price, which is $150,000, and is also to pay a royalty of $1 a ton for all ore sbipped or milled. It must indeed he a bonanza to justify the price and other conditions of the deal, hut we are told that the company will make a fortune out of the ore that is in sight. The ledge is said to have heen traced for five miles.

MONTANA.

ON THE RAMSHORN.—The Ramshorn Gold Mining Company, organized recently, has commenced active and extensive operations in the Ramsborn district, says the *Madisonian*. They are developing seven claims, of which the Pedro and Bernard have received the most attention, a goodly quantity of bigh grade ore having been blocked out of each of them. A five stamp mill is now being erected on the Bernard site on Ramshorn creek and will commence crushing as soon as it is completed. This group of mines has already made a record as an ore producer, the aggregate returns of the past running into the thousands, and now that a company of enterprising mining men having taken bold some good to Madison county may be expected therefrom. The officers of the new company are: George Conway of Glendale, president; Dr. Henry Jameson of Indianapolis, vice-president; Philip F. Igo of Indianapolis, secretary; and. Charles A. Harvey of Melrose, treasurer.

BITTER ROOT GOLD.—There is considerable excitement in Spokane over the finding of rich placers on French creek, about fifteen miles from Pierce City and about twenty miles from where Colgate's hody was found, says a Spokane correspondent of the Missoula *Democrat*. Several Spokane men explored the wilds of the Bitter Root mountains and with good success. They are said to have uncovered rich diggings and are putting in hydraulic works and getting in sbape for permanent camp. From tests made they expect to clean up from $15 to $20 a day for each man's work. Cahins are heing built and enough supplies laid in to carry them through the hardest kind of a winter. One of the party, M. C. Murtagh, is now at the Gillette Hotel arranging for the last shipment of supplies.

"We are satisfied that no prospector ever visited that country before," said Mr. Murtagh. "It is only about fifteen miles from Pierce City, but you must remember that seven and one-half miles are on edge. We have made a trail now, but the first trip was an experience. The rocks and hills are piled up just like ocean waves. We forced our way through the thickest kind of underbrush, climed over boulders and down bluffs and scrambled over fallen trees piled up twenty feet. But we got through finally.

"It is a magnificent timber country. The forest is so dense that it is always damp, and even when the underbrusb is cut and piled up it will not burn. There are places where the needles are mattered two and three feet deep on the ground. On our land alone, it is safe to say, there are at least a dozen huge red cedar trees that are from nine to thirteen feet in diameter, and so high that it hurts one to look up to the top.

"Besides the placer ground we have located ledges of free-milling gold quartz, samples of which I intend to have tested hefore my return. In short, the inducements that country offers to mining men are such that it seems strange it was not thoroughly prospected several years ago.

Coast Industrial Notes.

—The wire for Zimmerman's new cable across the Columbia has arrived at Pasco, Wash. It weighs 3000 pounds. The Columbia there is over 2000 feet wide.

—The Columhia river sturgeon fisheries, for many years an industry of considerable importance, are rapidly going into decline, owing, it is claimed, to the large numher killed hy fish traps and wheels.

—It is calculated that in '93 the mining yield of the State represented a value of $14,000,000, the wheat industry $14,000,000, the dairy industry $12,000,000, the fruit industry $11,000,000, the grape and wine industry $8,000,000, and the sheep industry $7,000,000.

—The *Iron Age* says: "C. P. Huntington has bought for Pacific coast delivery a block of 6000 tons of cannel (English) steel rails at a low price. This verifies the assertions repeatedly made by American manufacturers that they are in danger of losing the Pacific coast market."

—The *Overland Monthly* is authority for the statement that in California it costs 92½ cents to raise 100 pounds of wheat on ranches of 1000 acres, 83 cents on ranches of 2000 acres, 75 cents on ranches of 6000 acres, 60 cents on ranches of 15,000 acres, 50 cents on ranches of 30,000 acres, and 40 cents on ranches of 50,000 acres.

—The largest lumber deal ever made in British Columhia is said to have heen just arranged hy the Ross, McLaren Lumber Company, who are reported to have contracted with the South African Mining Company for 100,000,000 feet of lumher. The Ross, McLaren Company is composed of Eastern lumher men, who have two large mills, one near Westminister and the other near Vancouver. One has never heen worked and the other has heen shut down for three years owing to the low price of lumher. It is stated that hoth mills will be started up shortly.

—Tenders for the construction and maintenance of a Pacific cable were opened hy the Canadian Minister of Trade this week. Six offers have been received from English firms The figures will not he made puhlic at present, but in every case they are below the estimates made hy the engineers. No objection is offered to the length of the link of 7000 miles between Vancouver and Fanning island, the point designated as the landing place if a suitable one cannot be had in the Hawaiian group.

—Steel has not been used in constructing dams hitherto, but it will soon be tried in a work of that class on the Santa Ana river. This dam will he 100 feet high, and it is expected that it will cost ahout $80,000. The foundation of the dam will he made of steel tuhes imhedded in the solid rock of the river. The face of the dam will he made of plates riveted together and painted to preserve them from rust. Some of the advantages which steel is claimed to have over stone masonry in the construction of dams are that it is cheaper, more quickly constructed and less liable to he injured by the effect of earthquakes. If the present experiment proves a success, steel will douhtless largely take the place of otber material in the construction of dams.

Proposed Amendments.

TO THE EDITOR:—As it is proposed that the convention to be held here on the 19th shall consider and recommend some changes in the laws relating to the location, holding and purchase of mining claims, I would like to suggest a few radical changes which would greatly simplify matters and do away with the most of the litigation and uncertainty which attend the mining industry under the present complicated and burdensome regulations.

First, the side lines of all locations hereafter made should extend downward vertically like the end lines so as to avoid all controversy about apexes, dips, spurs and angles, cross ledges, etc. Claims may be twenty acres each as now, but let them be made without regard to the width on each side of the vein, and without limiting the width to six hundred feet, provided the length is proportionally shortened so as to include only twenty acres. This is to permit the following of the dip or pitch of the vein as deep as possible within the side lines. The locator should be allowed to shape his claim with reference to the course and pitch of the vein that he wishes to secure.

Second, instead of requiring the expenditure of one hundred dollars annually upon each claim, which is of little or no practical value to himself or the Government, let the locator pay one dollar per acre each year at the local U. S. Land Office, which will give him a whole year in which to look for his ledge, if a blind one, without fear of molestation by other prospectors. The hundred dollars now required to be expended will buy the claim of twenty acres at five dollars per acre. If a promising location, the miner might enter it at once by paying the hundred dollars and getting his Land Office certificate, which would be a perfect title. As long as the Government receives the highest price for the land, no controversy can arise as to its mineral character, that question having been determined by the payment of the price asked for lode claims. If the miner is willing to pay for the highest priced land, the Government should be satisfied, and no one else has a right to complain. If he has made a bad bargain, it is his own business. Is it not better than expending one hundred dollars annually in doing assessment work as it is now generally performed?

As to the disposition of the money thus paid to the Government, the system prevailing in Australia might well be adopted of sinking wells in the desert mineral regions, constructing reservoirs or otherwise providing water for the development of the mines; in constructing roads and bridges; in rewards for new discoveries and in assisting in the development or perfecting of new and better processes for extracting the precious metals from refractory ores, and in publishing geological maps and reports and scientific works relating to metallurgy in its various departments.

Many good reasons for the changes proposed might be furnished if space permitted. My purpose is to merely suggest them for consideration by the convention. T.

The Homestake Report.

The report of the superintendent of the Homestake Mining Company for the fiscal year ending June 1, 1894, has been made. The report shows that the net proceeds from gold bullion were $1,372,669 and from other sources $117,000, making a total of $1,489,669. In dividends there have been paid $181,000. The stock pays fifteen per cent every three months. There is sufficient gold ore in sight to keep the mill at work for eight years at its present capacity. This report touches only the Homestake mine and mills, and does not include the Highland, Deadwood-Terra and other properties generally included under the name of the Homestake mine. The United States has now pending a suit for $700,000 against the Homestake Mining Company for trespass on timber lands.

RUPTURE!

IT has been considered by the medical profession that hernia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

Selby Smelting and Lead Company,
416 Montgomery Street, San Francisco.
Gold and Silver Refinery
—AND—
Assay Office.
HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.
Manufacturers of
BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.

Trolleys and Road Improvement.

For several years past, says *Harper's Weekly*, there has been a zealous agitation in favor of the improvement of country roads. As pointed out from time to time in this paper, this agitation, this movement, is now resulting in a practical betterment of the highways in many localities, and a general discussion of ways and means to such ends in almost every enlightened neighborhood in the country.

But the road improvers and the makers of road laws need to be on their guard, for it has been demoustrated, time and again, in the near neighborhood of large cities, that so soon as country roads in populous neighborhoods, or between prosperous villages, have been graded and paved tbe builders of trolley roads pounce upon them, and divert them almost completely from the purpose for which they were intended. The extension of trolley lines into tbe country should be encouraged in all proper ways, but the public authorities, the law makers, and the people should insist that these trolleys should be located in proper places.

The pavement of a macadamized roadway is meant to drive on; it is injured very seriously by having a horse-car track on it; for driving purposes it is ruined by having a trolley track upon it—ruined as completely as though an ordinary railroad track were placed over tbe pavement. Nor should the spaces between the pavement and the ditches be used for railway tracks, for these spaces are admirable driving roads more than balf the time, and the rest of the time are needed for drainage purposes in taking the rainfall from the pavement to the ditches. A railway tract of any kind would interrupt this drainage, which is of the greatest possible importance, as the Macadam pavement is, after all, as much in the nature of a roof as anything else. The inventor of this system of road building maintained that if a road-bed were made dry by drainage, and kept dry by an impervious covering, it would carry any load that could be placed upon it. And the experience of four generations has proved that Macadam was right in his theory. But if we break this roof for a railway track, or if we interrupt the surface flow of water by a railway track on the side, then the whole purpose of the road construction has been defeated.

It is desirable, bowever, that trolley lines should be located near to the roads, for then tbey are easily accessible. The natural place for tbem is on the road side, beyond tbe ditcbes. This location involves the expense of grading for the railway road bed, and hence the builders of trolleys endeavor to secure permission to put their lines on the road-bed, where everything has been prepared in advance. This is as wrong as it can be, for such locations not only ruin the roadway, but make it dangerous to life. Tbere should be incorporated in every road law that no permission should be given to place a railroad on the roadway without referring the question to the popular vote of the township, and requiring that tbe railroad should then pay a rental of not less than ten per cent per annum on the first cost of the roadway. Such a provision of the law would compel trolley roads to seek and find other locations for their lines, and would leave the common roads for the uninterrupted use for which they were intended.
